Preface

Introduction for Students Preparing for the NCLEX-RN® Examination

Overview

Classification of Questions

General Clues for Answering Multiple-Choice Questions

Alternate Item Formats

Comprehensive Examinations and Focus for Study Worksheets

Companion CD

How to Use This Book When Studying

Taking the Licensure Examination

Unit 1: Foundations of Nursing Practice

Chapter 1: Factors Influencing Client Needs and Nursing Care

Concepts from Sociology

Hierarchy of Needs

Individual Factors Affecting Health

Stress Response

Grieving Process

Health-Illness Continuum and Rehabilitation

Type of Condition Affecting Client

Level of Preventive Care

## Chapter 2: Basics of Nursing Practice

Nursing Process

Ensuring Quality Health Care

Communication

Teaching-Learning

Leadership and Management

Nursing Practice and the Law

Medication Administration

## Chapter 3: Integral Aspects of Nursing Care

Pain

Infection

Fluid, Electrolyte, and Acid-Base Balance

Perioperative Care

Neoplastic Disorders

Emergency Situations

## Chapter 4: Foundations of Nursing Practice: Review Questions with Answers and Rationales

## Unit 2: Medical-Surgical Nursing

## Chapter 5: Growth and Development of the Adult

The Young Adult (Age 20 to 44 Years)

The Middle-Age Adult (Age 45 to 59 Years)

The Young-Older Adult (Age 60 to 74 Years)

The Middle-Older Adult (Age 75 to 84 Years) and Old-Older Adult (Age 85+ Years)

## Chapter 6: Nursing Care of Clients with Circulatory System (Cardiovascular, Blood, and Lymphatic Systems) Disorders

Overview

Major Disorders of the Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

## Chapter 7: Nursing Care of Clients with Respiratory System Disorders

Overview

Major Disorders of the Respiratory System

## Chapter 8: Nursing Care of Clients with Gastrointestinal System Disorders

Overview

Major Disorders of the Gastrointestinal System

## Chapter 9: Nursing Care of Clients with Endocrine System Disorders

Overview

Major Disorders of the Endocrine System

## Chapter 10: Nursing Care of Clients with Integumentary System Disorders

Overview

Major Disorders of the Integumentary System

## Chapter 11: Nursing Care of Clients with Neuromusculoskeletal System Disorders

Overview

Major Disorders of the Neuromusculoskeletal System

## Chapter 12: Nursing Care of Clients with Urinary/Reproductive System Disorders

Overview

Major Disorders of Urinary/Reproductive Systems

## Chapter 13: Nursing Care of Clients with Infectious Diseases

Overview

Related Procedures: Standard and Transmission-Based Precautions

Major Infectious Diseases

## Chapter 14: Medical-Surgical Nursing: Review Questions with Answers and Rationales

Growth and Development

Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

Respiratory System

Gastrointestinal System

Endocrine System

Integumentary System

Neuromusculoskeletal System

Urinary/Reproductive Systems

Infectious Diseases

Drug-Related

Growth and Development

Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

Respiratory System

Gastrointestinal System

Endocrine System

Integumentary System

Neuromusculoskeletal System

Urinary/Reproductive Systems

Infectious Diseases

Drug-Related Responses

## Unit 3: Mental Health/Psychiatric Nursing

### Chapter 15: Foundations of Mental Health/Psychiatric Nursing

Development of Personality

Physiology, Cognition, Emotions, and Behavior

Anxiety and Coping Behaviors

## Chapter 16: The Practice of Mental Health/Psychiatric Nursing

Legal Concepts Related to Mental Health/Psychiatric Nursing

Community Health Services

Therapeutic Nurse-Client Relationship

Crisis Intervention

Nursing Care in Relation to Violence

Nursing Care in Relation to Therapeutic Modalities

## Chapter 17: Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

Overview

General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

Major Disorders First Evident in Infancy, Childhood, or Adolescence

## Chapter 18: Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

Overview

General Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

Major Disorders Related to Alterations in Cognition and Perception

## Chapter 19: Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood

Overview

Major Disorders Associated with Anxiety

Major Somatoform Disorders

Major Disorders Related to Alterations in Mood

## Chapter 20: Nursing Care of Clients with Disorders Related to Alterations in Behavior

Overview

Major Disorders Related to Alterations in Behavior

## Chapter 21: Nursing Care of Clients with Sexual and Gender Identity Disorders

Overview

General Nursing Care of Clients with Sexual and Gender Identity Disorders

Major Disorders Associated with Sexual and Gender Identity Conditions

## Chapter 22: Mental Health/Psychiatric Nursing: Review Questions with Answers and Rationales

Foundations of Mental Health/Psychiatric Nursing

The Practice of Mental Health/Psychiatric Nursing

Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood

Nursing Care of Clients with Disorders Related to Alterations in Behavior

Nursing Care of Clients with Sexual and Gender Identity Disorders

Foundations of Mental Health/Psychiatric Nursing

The Practice of Mental Health/Psychiatric Nursing

Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood

Nursing Care of Clients with Disorders Related to Alterations in Behavior

Nursing Care of Clients with Sexual and Gender Identity Disorders

## Unit 4: Childbearing and Women's Health Nursing

### Chapter 23: Nursing Care to Promote Childbearing and Women's Health

Health Promotion

Family Planning

Related Procedures

Related Pharmacology

# Chapter 24: Nursing Care Related to Major Disorders Affecting Women's Health

Major Disorders Affecting Women's Health

# Chapter 25: Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period

Prenatal Period

Intrapartum Period (Labor and Birth)

Postpartum Period

# Chapter 26: Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period

Tests to Identify and/or Monitor High-Risk Pregnancy

Nursing Care of Pregnant Women with Special Needs

Nursing Care of Pregnant Women with Preexisting Health Problems

Nursing Care of Women with Complications during the Prenatal Period

Nursing Care of Women with Complications During the Intrapartum Period

Nursing Care of Women with Complications During the Postpartum Period

# Chapter 27: Nursing Care of the Newborn

Foundations of Nursing Care for Newborns

Nursing Care of High-Risk Newborns

# Chapter 28: Childbearing and Women's Health Nursing: Review Questions with Answers and Rationales

Nursing Care to Promote Childbearing and Women's Health

Nursing Care Related to Major Disorders Affecting Women's Health

Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period

Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period

Nursing Care of the Newborn

Nursing Care to Promote Childbearing and Women's Health

Nursing Care Related to Major Disorders Affecting Women's Health

Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period

Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period

Nursing Care of the Newborn

## Unit 5: Child Health Nursing

### Chapter 29: Foundations of Child Health Nursing

Growth and Development of the Child

Play

The Family

Age-Related Responses to Pain

Principles Related to Medications for Children

### Chapter 30: Nursing Care of Infants

Growth and Development

Health Promotion of Infants

Hospitalization of Infants

Health Problems That Begin in Infancy and May Persist through Childhood (Nursing care includes care of the infant and child)

Gastrointestinal Malformations

Cardiac Malformations

Neurologic Malformations

Genitourinary Malformations

Skeletal Malformations

Health Problems that Develop during Infancy

### Chapter 31: Nursing Care of Toddlers

Growth and Development

Health Promotion of Toddlers

Hospitalization of Toddlers

Health Problems Most Common in Toddlers

### Chapter 32: Nursing Care of Preschoolers

Growth and Development

Health Promotion of Preschoolers

Hospitalization of Preschoolers

Health Problems Most Common in Preschoolers

## Chapter 33: Nursing Care of School-Age Children

Growth and Development

Health Promotion of School-Age Children

Hospitalization of School-Age Children

Health Problems Most Common in School-Age Children

Skin Infections and Infestations

## Chapter 34: Nursing Care of Adolescents

Growth and Development

Health Promotion during Adolescence

Hospitalization of Adolescents

Health Problems Most Common in Adolescents

## Chapter 35: Child Health Nursing: Review Questions with Answers and Rationales

Nursing Care of Infants

Nursing Care of Toddlers

Nursing Care of Preschoolers

Nursing Care of School-Age Children

Nursing Care of Adolescents

Nursing Care of Infants

Care of Toddlers

Nursing Care of Preschoolers

Nursing Care of School-Age Children

Nursing Care of Adolescents

## Unit 6: NCLEX Preparation Toolkit

## Chapter 36: Comprehensive Examination 1

Review Questions: Part A

Review Questions: Part B

Answers and Rationales: Part B

## Chapter 37: Study Worksheets for Reviewing Your Test-Taking Performance

Introduction

How to Maximize Use of the Comprehensive Examinations

How to Develop a Focus for Study

## Notices

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical products identified, readers are advised to check the most current information provided (i) on procedures featured or (ii) by the manufacturer of each product to be administered, to verify the recommended dose or formula, the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual

patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions, or ideas contained in the material herein.

# Preface

---

The information in *Mosby's Comprehensive Review of Nursing for the NCLEX-RN Examination* has been totally revised and updated for this 20th edition. The progression of subject matter in each area reflects the consistent approach that has been used throughout the book. Information presented incorporates the latest knowledge, newest trends, and current practices in the profession of nursing.

The Introduction for Students Preparing for the Licensure Examination provide information about the NCLEX-RN® Examination, including the classifications used in the test plan structure. It also reviews clues for answering multiple-choice questions, provides examples of alternate-format items, and discusses the comprehensive exams and how to use this book when studying. Foundations of Nursing Practice—Unit 1 (Chapters 1 through 3)—discusses factors that influence client needs, the basics of nursing practice, and integral aspects of nursing care. These chapters present information essential to the practice of nursing that is common to all of the clinical areas. Content related to Medical-Surgical Nursing is presented in Unit 2 (Chapters 5 through 13); content related to Mental Health/Psychiatric Nursing is presented in Unit 3 (Chapters 15 through 21); content related to Childbearing and Women's Health Nursing is presented in Unit 4 (Chapters 23 through 27); and content related to Child Health Nursing is presented in Unit 5 (Chapters 29 through 34). Chapters 4, 14, 22, 28, and 35 consist of questions with their answers and rationales that relate to Foundations of Nursing Practice, Medical-Surgical Nursing, Mental Health Nursing, Childbearing and Women's Health Nursing, and Child Health Nursing, respectively. Chapter 36 in Unit 6 contains a 265-item Comprehensive Exam that mirrors the NCLEX-RN® Examination. Chapter 37 in Unit 6 contains two Study Worksheets: *Focus For Study Worksheet—Adapted NCLEX-RN Test Plan* and *Focus For Study Worksheet—Content Areas*. These worksheets promote an individualized assessment that can focus future study.

The Medical-Surgical, Mental Health/Psychiatric, Childbearing and Women's Health and Child Health Nursing chapters incorporate information from the basic sciences: nutrition, pharmacology, acute and long-term care, and physical and emotional nursing care. We continue to present the material in the traditional clinical groupings for we still believe that when preparing for a comprehensive examination, the average student will study all of the distinct parts before attempting to put them together. Although we believe that in practice the nursing process is continually evolving rather than remaining a clearly defined step-by-step process, we present the content under the following headings: Assessment/Analysis, Planning/Implementation, and Evaluation/Outcomes. We believe that this grouping avoids needless repetition, recognizes the abilities of our readers, and reflects current practice.

Over 4200 questions have been included in this edition of *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*. More than 500 of them are new questions that reflect the increased emphasis on Management of Care, Reduction of Risk

Potential, and Alternate Format Items. Although the majority of the questions are multiple-choice, the number of alternate format items (e.g., multiple-response items, ordered-response items, fill-in-the-blank items, hot spot items, and exhibit items) in the book was increased to 618.

The questions in [Chapters 4, 14, 22, 28, and 35](#) are grouped according to the chapter in which the content of the question is presented. For every question in this edition and on the CD-ROM we have provided rationales that state the reason why the correct answer is correct, as well as why the incorrect answers are incorrect. To further assist the user in studying/reviewing by a specific content area, the questions are classified according to Client Need, Cognitive Level, Nursing Process, Integrated Process (if applicable), and Reference. The Reference category at the end of each answer/rationale refers the student to the chapter and major headings under which the content in the question is presented in more detail in *Mosby's Comprehensive Review of Nursing for the NCLEX-RN Examination*.

One Comprehensive Exam is included in this textbook and on the Companion CD along with a second Comprehensive Exam that appears only on the Companion CD-ROM. These comprehensive exams provide an opportunity for the test taker to experience testing situations that approximate the NCLEX-RN®. To parallel the NCLEX-RN®, the first 75 questions in each test reflect the minimal testing experience for students taking the NCLEX-RN®. The total number of 265 questions in each test reflects the maximum number of questions that a student can take on the NCLEX-RN®. On the CD all of the questions in the comprehensive exams have been analyzed as to Client Need, Cognitive Level, Nursing Process, Integrated Processes (if applicable), and Reference to content in *Mosby's Comprehensive Review of Nursing for the NCLEX-RN Examination*.

The Companion CD-ROM contains the 2245 questions from the book, as well as 196 additional test questions that can be used in both study and test format. These questions also have been categorized by Client Need, Cognitive Level, Nursing Process, and Integrated Process (if applicable). Whether the test taker answers these questions in a written or computerized format the information being tested remains constant. To reinforce learned information and build confidence in taking a computerized test, we suggest that students practice answering questions on this CD to simulate the computerized NCLEX-RN®. The Companion CD has three practice modes: Study, Quiz, and Exam. The Study and Quiz modes allow a selection of topics and categories to create an exam consisting of as many items as desired. The Study mode provides immediate feedback and rationales as each question is answered. The Quiz mode provides an analysis of performance once all the questions on the exam have been answered. The Exam mode includes two Comprehensive Exams with 265 questions each that will appear in random order each time the test is taken. A third option, Comprehensive Exam Random, generates 265 questions randomly from all questions available. Content selection allows for a choice of questions by client need, step of the nursing process, or content area to individualize a focused study. The Companion CD also includes brand new mp3 key point summaries that can be downloaded for on-the-go review.

All of the questions used in this edition have been submitted by outstanding

educators and practitioners/health care providers of nursing. Initially the editorial board reviewed all questions, selecting the most pertinent for inclusion in a mass field-testing project or analysis by a panel of expert nursing educators. Students graduating from baccalaureate, associate degree, and diploma nursing programs in various locations in the United States provided a diverse group for the mass field-testing project or focus group sessions. Results were statistically analyzed. This analysis, in addition to the input from the panel of expert nursing educators, was used to select questions for inclusion in the book.

We would like to take this opportunity to thank Kristin Geen, Executive Editor, for her masterful leadership; Jamie Horn, Senior Developmental Editor, for her dedication to this project and for keeping us focused; Johnny Gabbert, Project Manager, for being always available and having the answers to all of our questions; Karen Pauls, Designer, for taking a complex manuscript and making it easy on the eyes and brain; Debbie Prato, Copyeditor, for ensuring a crisp, accurate manuscript; and finally Eloise DeHaan, Proofreader, for her meticulous attention to detail in relation to content and format.

In addition, we recognize the exemplary work of the Contributing Authors, Contributing Item Writers, and Reviewers that reflects their dedication and expertise. We thank our proofreaders Erin Mitchell, Frances Timcheck, Kathleen Ashker, Cheryl Wolff, and Dorene Lebowitz for their help in the final stages of manuscript preparation. A special thank you goes to Barbara Vitale for work over and beyond the call of her content editorial duties. We especially appreciate our families for their patience and understanding when the production of this book consumed most of our time and energy.

**Judith S. Green**

**Mary Ann Hellmer Saul**

# Introduction for Students Preparing for the NCLEX-RN® Examination

---

# Overview

The NCLEX-RN® examination is integrated and comprehensive. Nursing candidates are required to answer questions that necessitate a recognition and understanding of the physiologic, biologic, and social sciences, as well as the specific nursing skills and abilities involved in a given client situation.

This textbook and CD contain a total of 4210 questions. They include objective multiple-choice questions, as well as alternate-format questions (615 items) such as multiple-response items, ordered-response items, fill-in-the-blank items, hot spot items, exhibit items, and audio items. To answer the questions appropriately, a candidate needs to understand and correlate certain aspects of anatomy and physiology, the behavioral sciences, fundamentals of nursing, the effects of medications administered, the client's attitude toward illness, and other pertinent factors such as legal responsibilities, leadership and management, and critical thinking. Most questions are based on nursing situations similar to those with which candidates have had experiences because they emphasize the nursing care of clients with representative common health problems. Some questions, however, require candidates to apply basic principles and techniques to clinical situations with which they have had little, if any, actual experience.

To prepare adequately for an integrated comprehensive examination, it is necessary to understand the discrete parts that compose the universe of material under consideration. This is one of the major principles of learning that has contributed to the development of *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*.

Using this principle, the text begins with Unit 1—Foundations of Nursing Practice. The information in this unit is essential to each of the major clinical areas: Unit 2—Medical-Surgical Nursing, Unit 3—Mental Health/Psychiatric Nursing, Unit 4—Childbearing and Women's Health Nursing, and Unit 5—Child Health Nursing. Chapters at the end of each unit contain questions that test the student's knowledge of principles and theories underlying nursing care specific to the content within the unit. The questions represent a variety of situations, in a variety of settings, and with a variety of nursing objectives. Each question has rationales for the correct answer and incorrect options, as well as a classification of the question that reflects the NCLEX-RN® examination test plan. The following descriptions are presented to assist in the understanding of these classifications.

# Classification of Questions

Every question in the book and in both comprehensive exams is classified by the following categories: Client Need, Cognitive Level, Integrated Process, Nursing Process, and a Reference to content within *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*. In the Comprehensive Exams the percentage of test questions assigned to each Client Need category and subcategory reflects the 2010 NCLEX-RN Test Plan. These percentages are included adjacent to the specific Client Need category.

## Client Need

These categories reflect activities most frequently performed by entry-level nurses.

### 1. Safe and Effective Care Environment

*Management of Care* (16% to 22%): These questions provide or direct the nursing activities that promote the delivery of care to clients, family members, significant others, and other health care personnel.

*Safety and Infection Control* (8% to 14%): These questions address the protection of clients, family members, significant others, and health care personnel from health and environmental hazards.

### 2. Health Promotion and Maintenance (6% to 12%)

These questions provide or direct the nursing care of the client, family members, and significant others. They include knowledge of the principles of growth and development, prevention and/or detection of health problems, and interventions to achieve optimum health.

### 3. Psychosocial Integrity (6% to 12%)

These questions provide or direct the nursing care that supports and promotes the emotional, mental, and social well-being of the client, family members, and significant others experiencing stressful events, as well as clients with acute or chronic mental health illness.

### 4. Physiological Integrity

*Basic Care and Comfort* (6% to 12%): These questions address the provision of comfort and support in the performance of the activities of daily living. These include elimination, mobility, hydration, nutrition, hygiene, comfort, rest, and sleep.

*Pharmacological and Parenteral Therapies* (13% to 19%): These questions address the provision of care related to the administration of medications, parenteral therapies, and blood products.

*Reduction of Risk Potential* (10% to 16%): These questions address the nursing care that may limit the likelihood of the development of complications or health problems related to existing disorders, treatments, or procedures.

*Physiological Adaptation* (11% to 17%): These questions address the provision and management of the nursing care for clients with acute, chronic, or life-threatening physical health problems.

## Cognitive Level

This category reflects the thinking processes required to answer the question.

*Knowledge:* These questions require the test taker to recall information from memory. For example, they involve knowledge of facts, principles, generalizations, terminology, and trends.

*Comprehension:* These questions require the test taker to understand information. They involve the interpretation, paraphrasing, and summarization of information, as well as the determination of implications and consequences of information.

*Application:* These questions require the test taker to use information, principles, or concepts. They involve identifying, manipulating, changing, or modifying information as well as performing mathematical calculations.

*Analysis:* These questions require the test taker to interpret a variety of information. It involves the recognition of commonalities, differences, and interrelationships among data, concepts, principles, and situations.

## Integrated Process

Integrated processes are fundamental components critical to the practice of nursing. They include the nursing process, caring, communication and documentation, and teaching and learning. Because the nursing process (a scientific problem-solving process that involves critical thinking) is essential to all nursing care, it is included in each answer/rationale.

*Caring:* These questions reflect interactions between the nurse and client/significant others that demonstrate mutual trust and respect. They include the nursing care that provides support, encouragement, hope, and compassion.

*Communication/Documentation:* These questions involve verbal and nonverbal interactions between the nurse and client, significant others, and members of the health care team. Client status, events, and interventions are communicated and documented according to rights, responsibilities, and standards of care.

*Teaching/Learning:* These questions include nursing assessments and interventions that relate to the attainment of knowledge, skills, or attitudes that meet client needs.

## Phases of the Nursing Process

This category reflects the problem-solving process used by nurses to identify client needs, plan and implement nursing care, and evaluate client responses to care.

*Assessment/Analysis:* This phase requires the nurse to obtain objective and subjective data from primary and secondary sources, to identify and group significant data, and to communicate this information to other members of the health team. This phase also requires the nurse to interpret data gathered through assessment in order to make nursing decisions. Client and family needs are identified, and short-term and long-term goals/outcomes are set.

*Planning/Implementation:* This phase requires the nurse to design and implement a

regimen with the client, family, and other health team members to achieve goals/outcomes set during the assessment/analysis phase. It also requires setting priorities for intervention. The client may be given total care or may be assisted and encouraged to perform activities of daily living or follow the regimen prescribed by the health care provider. In addition, it involves activities such as counseling, teaching, and supervising health team members.

*Evaluation/Outcomes:* This phase requires the nurse to determine the effectiveness of nursing care. Care is reviewed, the client's response to intervention is identified, and a determination is made as to whether the client has achieved the predetermined outcomes and goals. It also includes the appraisal of factors that influence goal achievement (e.g., the client's abilities to fulfill the health care plan—physical, emotional, financial) and modification of the original plan as needed.

## Reference

Each question in the book and questions in both comprehensive examinations on the CD refer the test taker to the section where the related content concerning the question is within *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*. This promotes a review of the specific information as it relates to the question and permits a more thorough review of related information.

# General Clues for Answering Multiple-Choice Questions

On a multiple-choice test, the question and possible answers are called a *test item*. The part of the item that asks the question or poses a problem is called the *stem*. All of the possible answers presented are called *options*. One of the options is the correct answer or *key*; the remaining options are incorrect. The incorrect options are called *distractors* because their major purpose is to distract the test taker from the correct answer.

A Read the question carefully before looking at the answers.

1. Determine what the question is really asking; look for key words.
2. Read each answer thoroughly and see if it completely covers the material asked by the question.
3. Narrow the choices by immediately eliminating answers you know are incorrect.

B Because few things in life are absolute without exceptions, avoid selecting answers that include words such as *always*, *never*, *all*, *every*, and *none*. Answers containing these key words are rarely correct.

C Attempt to select the answer that is most complete and includes the other answers within it. An example might be as follows. A stem might ask “A child’s intelligence is influenced by:” and three options might be *genetic inheritance*, *environmental factors*, and *past experiences*. The fourth option might be *multiple factors*, which is a more inclusive choice and therefore the correct answer.

D Make certain that the answer you select is reasonable and obtainable under ordinary circumstances and that the action can be carried out in the given situation.

E Watch for grammatical inconsistencies. If one or more of the options is not grammatically consistent with the stem, the alert test taker can identify it as a probable incorrect option. When the stem is in the form of an incomplete sentence, each option should complete the sentence in a grammatically correct way.

F Avoid selecting answers that state hospital rules or regulations as a reason or rationale for action.

G Look for answers that focus on the client or are directed toward feelings.

H If the question asks for an immediate action or response, all of the answers may be correct, so base your selection on identified priorities for action.

I Do not select answers that contain exceptions to the general rule, controversial material, or degrading responses.

J Reread the question if the answers do not seem to make sense, because you may have missed words such as *not* or *except* in the statement.

K Do not worry if you select the same numbered answer repeatedly, because there usually is no pattern to the answers.

L Mark the number next to the answer you have chosen.

M Answer every question because on the NCLEX-RN® exam you must answer a question before you can move on to the next question.

# Alternate Item Formats

In addition to multiple-choice questions, the NCLEX-RN® exam includes alternate-format questions. These questions consist of five types: multiple-response items, ordered-response (drag and drop) items, fill-in-the-blank items, hot spot, and exhibit items. The following examples reflect these alternate item formats.

## Multiple-Response Item

Multiple-response items pose a question and then include a list of responses that may or may not answer the question. The test taker is directed to indicate all the correct options.

The nurse suspects that a postpartum client is experiencing postpartum depression without psychotic features. Which assessment findings support this conclusion? **Select all that apply.**

1. ☐ Delusions
2. ☐ Somnolence
3. ☐ Ambivalence
4. ☐ Increased appetite
5. ☐ Emotional lability

Answer: 2, 4, 5.

1. Delusions occur 50% of the time with postpartum depression with psychotic features.
2. **A yearning for sleep, sleeping heavily, and an inability to go back to sleep if awakened are all associated with postpartum depression without psychotic features.**
3. Ambivalence is experienced by many postpartum women and during postpartum blues. With postpartum depression without psychotic features the woman is often fearful, anxious, angry, and despondent.
4. **Women with postpartum depression without psychotic features often have odd food cravings (often desserts) and tend to binge eat and gain weight.**
5. **These women are irritable, and their behavior escalates with little provocation. They experience spontaneous crying episodes and have severe anxiety and panic attacks.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 25](#), Postpartum Period, Data Base

## Ordered-Response (Drag and Drop) Item

Ordered-response items present information or a series of statements and then ask the test taker to place them in order of priority.

A client is receiving an IV piggyback oxytocin (Pitocin) infusion to induce labor. The client experiences three contractions that are 90 seconds long and occur less than 2 minutes apart. List in order of priority the nursing actions that should be taken.

1.  Administer oxygen
2.  Call the health care provider
3.  Interrupt the oxytocin infusion

4. \_\_\_\_\_ Assess maternal/fetal responses
5. \_\_\_\_\_ Document fetal/maternal responses

Answer: 3, 1, 4, 2, 5.

3. The dose of oxytocin is excessive, causing prolonged, intense uterine contractions that can precipitate uterine rupture. The oxytocin (Pitocin) must be stopped immediately.
  1. Excessive contractions decrease blood flow to the placenta; this can result in fetal heart rate decelerations (e.g., bradycardia, diminished variability, late decelerations) and fetal hypoxia. Oxygen will improve the amount of oxygen being supplied to the placenta and eventually to the fetus.
  4. Maternal and fetal responses to the cessation of the oxytocin infusion and the administration of oxygen should be evaluated next. The mother and fetus are the priority.
  2. The health care provider should be notified as soon as the initial interventions are implemented and the maternal and fetal responses are evaluated.
  5. Documentation of the event (e.g., length and intensity of contractions, nursing interventions, maternal and fetal responses, and notification of the health care provider) is done last after the needs of the mother and fetus are met.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Induction or Stimulation of Labor, Nursing Care of Women during Induction or Stimulation of Labor

## Fill-in-the-Blank Item

Fill-in-the-blank items involve a calculation. The question presents information and requires the test taker to manipulate the information to solve the problem posed, and then the test taker must record the solution to the problem.

The health care provider prescribes an IVPB infusion of 500 mg of an antibiotic to be added to 50 mL of normal saline to be administered four times daily. The antibiotic is supplied in single-dose vials containing 1 g each. The directions advise that the instillation of 0.8 mL of normal saline will yield 1.2 mL of solution. How much antibiotic solution should be added to the 50 mL of normal saline? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

**Answer: 0.6 mL.** First convert 500 mg to 1 g by using ratio and proportion. Then solve the problem by using ratio and proportion.

$$\text{Desire } 500 \text{ mg} = X \text{ g}$$

$$\text{Have } 1000 \text{ mg } 1 \text{ g}$$

$$1000X = 500$$

$$X = 500 \div 1000$$

$$X = 0.5 \text{ g}$$

$$\text{Desire } 0.5 \text{ g} = X \text{ mL}$$

$$\text{Have } 1 \text{ g } 1.2 \text{ mL}$$

$$X = 0.5 \times 1.2$$

$$X = 0.6 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2](#), Medication Administration, Nursing Responsibilities Related to Medication Administration

## Hot Spot Item\*

Hot spot items present a problem in relation to a figure. You are asked to answer the question by placing an X over an area on the figure. These items may focus on areas to be assessed or sites of clinical manifestations.

A nurse is assessing a client with the diagnosis of hypoparathyroidism. As part of the assessment the nurse assesses the client for Chvostek's sign. Place an X where the nurse should tap to elicit this sign.

Answer: Low serum calcium levels increase the movement of sodium across excitable membranes; depolarization occurs more easily. Tapping the face just below and in front of the ear stimulates the facial nerve; in the presence of hypocalcemia, muscle twitching on one side of the mouth, nose, and cheek occurs (Chvostek's sign).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hypoparathyroidism, Nursing Care

## Exhibit Item

Exhibit items present a situation and ask a question. A variety of objective and subjective information is presented about the client in formats such as the hospital record (e.g., laboratory test results, results of diagnostic procedures, progress notes, health care provider orders, medication administration record, health history), physical assessment data, and nurse/client interactions. After analyzing the information presented, the test taker answers the question. These questions usually reflect the analysis level of cognitive thinking.

Vital Signs
Temperature: 97.7° F (36.5° C) Heart rate: 110 beats per minute Respiration: 40 breaths per minute Blood pressure: 100/64
Physical Assessment
Thin appearance Experiencing fatigue Height and weight at 25th percentile for age Pale mucous membranes and conjunctiva
Laboratory Values
WBC: 6000/mm <sup>3</sup> RBC: $2.7 \times 10^6/\mu\text{L}$ Hb: 7.8 g/dL Hct: 22.3% Platelets: 278,000 $\mu\text{L}$

A parent brings a 4-year-old child to the clinic because the child is no longer able to keep up with older siblings when playing sports in the yard. The nurse obtains the child's vital signs, performs a physical assessment, and reviews the child's laboratory reports. What should be the nurse's **primary** intervention?

1. Preventing bleeding
2. Instituting contact precautions
3. Initiating a strict intake and output
4. Monitoring for cardiac decompensation

**Answer: 4 This child is severely anemic. The decreased red blood cells (the expected range for a 4-year-old is  $4.0$  to  $5.5 \times 10^6/\mu\text{L}$ ), low hematocrit (the expected range for a 4-year-old is 30% to 40%), and low hemoglobin (the expected range for a 4-year-old is 9.5 to 14 g/dL) place the child at risk for cardiac decompensation and heart failure. The child's cardiovascular status must be monitored closely.**

1. There is no information to indicate that the child is at risk for bleeding. The child's platelet count is within the expected range of 150,000 to 400,000/mm<sup>3</sup>.
2. The child's WBC count is within the expected range of 5000 to 10,000/mm<sup>3</sup>. There is no information to indicate that the child has an infection.
3. Although this may be done, it is not the priority.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 31](#), Iron Deficiency Anemia, Data Base

# Comprehensive Examinations and Focus for Study Worksheets

*Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination* contains two comprehensive examinations, one in [chapter 36](#) and one on the enclosed Companion CD. These tests approximate the NCLEX-RN® test plan. The first 75 questions in each examination reflect the minimum testing experience for students taking the NCLEX-RN® examination. The 265 questions in each test reflect the maximum number of questions a student will be asked on the NCLEX-RN® exam. The questions require the test taker to cross clinical disciplines and respond to individual and specific needs associated with given health problems. Rationales are also provided for the correct answers and the incorrect options to these questions. In addition, each question is classified according to client need, cognitive level, integrated process, and nursing process, and a reference is provided as to where the content in the question can be found in *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*. The purpose of these comprehensive tests is to provide students with an opportunity to simulate the NCLEX-RN® exam experience at the completion of a personalized program review.

In [chapter 37](#), *Focus for Study Worksheets*, two tools are present to help students analyze their test performance and provide information for designing a plan for study. The *Focus for Study Worksheet—Adapted NCLEX-RN® Test Plan* addresses the classifications used to reflect content on the NCLEX-RN® examination. The *Focus for Study Worksheet—Content Areas* reflects content within the domain of nursing and where the information can be found in *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination*.

# Companion CD

The Companion CD contains the 2245 questions that are in the book and an additional 1965 bonus questions, for a total of 4210 questions. Of these questions, 615 are alternate format items. It contains three practice modes: Study, Quiz, and Exam. The Study and Quiz modes allow the test taker to select topics and categories to create an exam consisting of as many items as desired. The Study mode provides immediate feedback and rationales as each question is answered. The Quiz mode provides an analysis of the test taker's performance once all of the questions on the exam have been answered. The Exam mode includes two Comprehensive Exams with 265 questions each that will appear in random order each time a test is taken. A third option, Comprehensive Exam Random, generates 265 questions randomly from all of the questions available. Items can be selected by client need, the step of the nursing process, and the content area so that the test taker can focus studying based on a self-assessment of individual needs or the results of a personal analysis from the Study Worksheets.

# How to Use This Book When Studying

A Start in one area. Study the material covered by the section. Refer to other textbooks to find additional details if you are unsure of a specific fact.

B Answer the questions following the area. As you answer each question, write a few words about why you think that answer is correct; in other words, justify why you selected that answer. If an answer you provide is a guess, mark the question to identify it. This will permit you to recognize areas that need further review. It will also help you to see how correct your “guessing” can be. Remember: on the licensure examination you must answer each question before moving on to the next question.

C Record the answer by circling the number of the option you believe is correct.

D Compare your answers with those provided. If you answered the item correctly, check your reason for selecting the answer with the rationale presented. If you answered the item incorrectly, read the rationale to determine why the option you selected was incorrect. In addition, you should review the correct answer and rationale for each item answered incorrectly. If you still do not understand your mistakes, review the material pertaining to these questions. The Content Area following the answers and rationales informs you of the area within *Mosby's Comprehensive Review of Nursing for the NCLEX-RN® Examination* where you can find related information included in the question. You should carefully review all questions and rationales for items you identify as guesses because you do not have mastery of the material being questioned.

E Following the rationales for the correct answer and the incorrect options, you will find that each question in the book is classified according to Client Need, Cognitive Level, Integrated Process, Nursing Process, and Reference. These categories were described previously in this Introduction and should help you to understand the question in relation to the NCLEX-RN® examination test plan.

F After you have completed the area questions, begin taking the comprehensive tests because they will assist you in applying knowledge and principles from the specific clinical area to any nursing situation.

1. Arrange a quiet, uninterrupted time span for each part of a comprehensive test.
2. Avoid spending excessive time on any one question. Most questions can be answered in 1 to 2 minutes.
3. Make educated guesses when necessary.
4. Read carefully and answer the question asked; pay attention to specific details in the question.
5. Try putting questions and answers in your own words to test your understanding.

G To help analyze your mistakes on the comprehensive examinations and to provide a data base for making future study plans, Study Worksheets follow each of the comprehensive tests. These worksheets are designed to aid you in identifying and recording errors in the way you apply information and to help you identify and record gaps in knowledge.

H After completing your worksheets, do the following:

1. Identify the frequency with which you made particular errors. As you review material

in class notes or this review book, pay special attention to acquiring information related to content that you found difficult on the tests.

2. Identify the topics you want to review. It might be helpful to set priorities; review the most difficult topics first so you will have time to review them more than once.

Use the Companion CD to individualize your style of review. Use one or more of the practice modes (e.g., Study, Quiz, and Exam) to personalize your focus of study based on a self-assessment of needs and/or an analysis of your Study Worksheets.

# Taking the Licensure Examination

The computerized NCLEX-RN® exam is an individualized testing experience in which the computer chooses your next question based on the ability and competency you have demonstrated on previous questions. The minimum number of questions will be 75 and the maximum 265. You must answer each question before the computer will present the next question, and you cannot go back to any previously answered questions. Remember that you do not have to answer all of the questions correctly to pass.

The following are crucial requisites for doing well on the licensure examination:

- A sound understanding of the subject
- The ability to follow explicitly the directions given at the beginning of the test
- The ability to comprehend what is read
- The patience to read each question and set of options carefully before deciding how to answer the question
- The ability to use the computer correctly to record answers
- The determination to do well
- A degree of confidence

## UNIT 1

# Foundations of Nursing Practice

# CHAPTER 1

# Factors Influencing Client Needs and Nursing Care

---

# Concepts from Sociology

## Basic Concepts

A Every human society has a process for socialization of its members

1. Cultural groups establish rules and codes of conduct using a system of rewards and punishment to govern members, and these become norms, values, and mores of a group
  - a. Reward leads to acceptance as a member of a group
  - b. Punishment for antisocial behavior leads to rejection and separation from a group
2. Role of members includes specified rights, duties, attitudes, and actions
3. Social boundaries separate one group from another; nonmembers have limited social contacts with members; causes a segmentation of relationships and provides few rewarding experiences for nonmembers
4. Leader's influence is limited to conditions placed on leader by total group

B A society is a reflection of all functional relationships that occur among its individual members; participation in society is a major influence on an individual's intellect, creativity, memory, thinking, and feeling

C Society or a group can change because of conflict among members

1. Conflict is greatest when there is absence of certain members, introduction of new members, or change in leadership
2. Ensuing reorganization goes through three stages
  - a. Tension: caused by conflict
  - b. Integration: members learn about "the other's" problem
  - c. Resolution: reconstruction of group's norms and values
3. Resolution of conflict and restoration of equilibrium
  - a. Occurs when members interact with one another and group is dynamic
  - b. Conflicts are not resolved when groups are rigid with fixed ideas

## Culture and Health

A General influences

1. Culture defines for its people what is important and what is true and real
2. Age, ethnicity, gender, education, income, and belief system (e.g., worldview, religion, or spirituality) make up sociocultural profile of clients
3. Clients' perceptions of health and illness, their help-seeking behavior, and adherence to treatment depend on beliefs, social norms, and cultural values
4. When clients face increased stressors, suffering, or pain, belief systems play a greater role in their lives
5. Ethnocentrism: belief that one's own culture is generally right or best
6. Assimilation: integration of common values, beliefs, attitudes, and behaviors of dominant culture
7. Common sociocultural stressors: stereotyping, intolerance, stigma, prejudice,

discrimination, and racism

## B Implications for nurses

1. Nurses should be in touch with their own personal and cultural experiences
2. Culturally competent nurses have an understanding of cultural diversity to provide care within a context that is appropriate for clients
3. Nurses must have a holistic perspective to assess sociocultural context of clients from different cultures Nurses must appreciate that clients bring their own cultures, attitudes, and belief systems to a situation
4. Together, nurse and client should agree on the nature of a client's coping responses and set goals and behavioral outcomes within client's sociocultural context
5. Degree of compatibility between client's and nurse's belief systems often determines greater satisfaction with treatment, adherence to therapeutic regimens, and treatment outcomes

# Society and Health

## A Role of society

1. Societies traditionally are responsible for caring for their ill
2. Society's role in health maintenance and prevention of disease has intensified
3. Society's provision for health maintenance includes
  - a. Establishment of public health care agencies for supervision, prevention, and control of disease and illness; protection of food, water, and drug supplies; development of public education programs
  - b. Awarding scholarships/grants for health education and research
  - c. Development of unemployment insurance programs and Workers' Compensation insurance; laws to ensure universal health insurance
  - d. Establishment of Social Security and Medicare programs; establishment of social welfare services and Medicaid programs
  - e. Supervision of medical and hospital insurance programs

## B Health care agencies function as a subculture of society

1. Employees develop both written and unwritten agency policies that
  - a. Set standards of acceptable behavior for both clients and staff
  - b. Provide formal delivery of nursing care (e.g., primary nursing, team nursing)
  - c. Avoid rewarding unacceptable behaviors by any members of a group, including the client
2. Health care agencies have several functions
  - a. Treatment of illness
  - b. Rehabilitation
  - c. Maintenance of health
  - d. Palliative care
  - e. Hospice care
  - f. Protection of clients' legal rights
  - g. Education of health professionals

h. Education of general public

i. Research

C Delivery of health services is the responsibility of the community

1. Health maintenance and treatment are no longer considered a privilege, but a right of all members of society
2. Members of society become active participants in prevention of illness
3. Services provided by health care agencies are influenced by community needs (e.g., based on shorter length of hospitalization; clients' need for transitional care provided by home care agencies, extended care, or assisted living facilities)

## Groups

A Group membership helps individuals achieve goals that are not attainable through individual effort

1. Types of groups include social, self-awareness, task-oriented, and therapy
2. Group functional roles include task roles, group-building or maintenance roles, individual or self-serving roles
3. Group content refers to subject matter or task being addressed
4. Group process refers to what is happening among and to group members while working; it addresses morale, feeling tones, influence, competition, conflict
5. Types of roles assumed by members of group
  - a. Harmonizer: brings other group members into accord while reconciling opposing positions
  - b. Questioner: asks questions, seeks information, and gives constructive criticism to group members
  - c. Deserter: talks about irrelevant material; usually disruptive in some manner
  - d. Tension reducer: introduces levity when needed and appropriate
  - e. Encourager: contributes to ego of others and is a responsive member
  - f. Monopolizer: attempts to control group; does not allow others to talk
  - g. Clarifier: restates issues for clarification and then summarizes for group
  - h. Opinion giver: uses own experience to back up opinion or belief
  - i. Initiator: proposes ideas or topics for discussion and suggests possible solutions for group discussion
  - j. Listener: shows interest in group by expressions on face or by body language while making little or no comment
  - k. Negativist: pessimistic, argumentative, and uncooperative
  - l. Energizer: pushes group into action
  - m. Aggressor: hostile and aggressive, verbally attacks other group members

B Family is the primary group

1. Helps society to establish and maintain its code of behavior
2. Provides individual family members with nontangible support
  - a. Strong emotional ties that occur when members
    - (1) Experience sensory stimuli through close contacts

- (2) Learn to care about emotional and physical well-being of one another
- (3) Are responsive to one another's feelings, acts, and opinions
- (4) Learn empathy by vicariously living experiences of others
- (5) View selves through others' eyes

b. Feeling of security by meeting dependent needs

c. System of communication: overt (e.g., words) or covert (e.g., body language)

d. Role identification and intimacy that help internalize acceptable behavioral patterns of family

e. Spirit of cooperation and competition through sibling interaction

3. Changes that have influenced family's ability to indoctrinate children with norms of society

a. Society has progressed from an agrarian culture through Industrial Revolution to Age of Technology

- (1) Families have undergone change from extended to nuclear units, with increased numbers of blended, single-parent, and same-gender parent households

- (2) New social groups are established to replace the extended family

- (3) Electronic influences (e.g., Internet, cell phones) have weakened family structure

- (4) Increased mobility of individuals has reduced contact with extended or separated family members

- (5) Participation in individual activities has grown, reducing time for involvement in family activities

b. Altered male and female role patterns

- (1) Altered status of women: increase in level of education, numbers working outside home, and role in decision making

- (2) Altered status of men: increase in willingness to assume homemaking responsibilities and shared decision making with women

- (3) Increased partnership in home and financial management has resulted in less stereotyped gender roles

- (4) Increased numbers of divorced or single parents, both male and female, rearing biological or adopted offspring

- (5) Increase in number of financially independent women conceiving or adopting a child or children outside of marriage

c. Factors resulting in reduction in size of families

- (1) Choosing to marry in later adulthood

- (2) Delaying start of a family until later years

- (3) Emphasis on limited population growth

- (4) Dissemination of birth control information

- (5) Legalization of abortions

- (6) Increase in financial cost involved in raising and educating children

C Peer groups help to establish norms of behavior

1. Youth learns about society through contact with peer group, which assists in rites of

passage from family group to society

2. Youth develops further self-concept in contact with other youths
3. Peer group interaction can produce change in its individual members
4. Members have a strong loyalty to peer group because of reciprocal relationships and other rewards the group offers
5. Peer group norms may conflict with family or societal norms

#### D Crisis intervention groups

##### 1. Services

- a. Provide assistance for people in crises; clients' previous methods of adaptation are inadequate to meet present needs
- b. Group focus can be specific (e.g., poison control, drug-addiction centers, and suicide prevention) or general (e.g., walk-in mental health clinics and hospital emergency services)
- c. Some crisis intervention groups provide service via the phone (e.g., poison control, AIDS hotline, and suicide prevention centers); others help those who are physically present (e.g., hospital emergency services and walk-in mental health clinics)

##### 2. Success factors

- a. Provide help requested by client or family
- b. Address immediate problem
- c. Facilitate exploring feelings
- d. Assist client in perceiving event realistically
- e. Maximize client's coping mechanisms
- f. Provide assistance in investigating alternative approaches to solve problem
- g. Identify support systems
- h. Review how present situation may help in coping with future crises
- i. Provide information about other health resources where additional assistance can be obtained

#### E Self-help groups

##### 1. Services

- a. Organized by clients or their families to provide services that are not adequately supplied by other organizations
- b. Meet needs of clients and families with chronic problems requiring intervention over an extended time
- c. Focus usually is specific (e.g., Gamblers Anonymous); some address a range of problems (e.g., Association for Children with Learning Disabilities)
- d. Some are nonprofit (e.g., Alcoholics Anonymous); others are profit-making organizations (e.g., Weight Watchers International)
- e. Provide help to people who do not or cannot conform to societal expectations (e.g., addicts, child abusers, mentally ill, obese, or brain-injured); many use 12-step program developed by Alcoholics Anonymous

##### 2. Success factors

- a. All members are accepted and respected as equals

- b. All members have experienced similar problems
- c. Members feel a decrease in sense of isolation that has occurred as a result of their problems
- d. Members address behavior and changes in behavior rather than underlying causes of behavior
- e. Members have a ready supply of human resources available, such as personal resources, help from peers, and ultimately extension of self to others as a role model
- f. Each member has identified the problem and wants help in meeting needs—self-motivation
- g. Ritual and language may be specific to the group and/or the problems
- h. Members retain leadership of group
- i. Group interaction
  - (1) Identification with peers—sense of belonging
  - (2) Group expectations—self-discipline required of members
  - (3) Small steps encouraged and, when attained, reinforced by group
- j. As member achieves success within the group, reinforcement often is received from outside the group
- k. Participation in 12-step programs is a lifelong, continuous process; one is never “recovered” but always “recovering” one day at a time

F Community is a social organization that is considered a secondary group

- 1. Relationships among members usually are more impersonal
- 2. Individuals participate in a more limited manner or in a specific capacity
- 3. Group frequently functions as a means to an end, enables diversified groups to communicate, and helps other groups identify community problems and possible solutions
- 4. Secondary group usually is large and meets on an intermittent basis; contacts usually are maintained through correspondence
- 5. Community leaders facilitate group interaction because they have knowledge of the community and its needs and the skill to motivate others to act
- 6. Secondary groups help establish laws that are necessary to limit antisocial behavior; they provide diversified groups with a common base of acceptable behavior, but they may favor and protect vested interests of specific groups within society

G Health educational groups

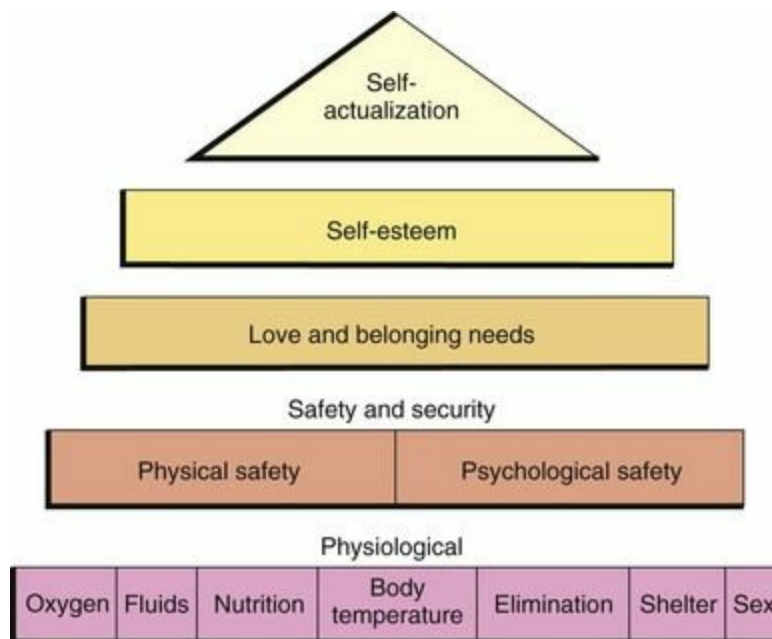

- 1. Services
  - a. Provide health information/support to change behavior
  - b. Meet needs of clients or families adapting to change
  - c. Focus usually is specific (e.g., diabetes education group, parenting group, Weight Watchers)
  - d. Majority of educational groups are conducted by health care providers and are nonprofit
  - e. In-service educational groups are included in this category
- 2. Success factors

- a. All members are accepted and respected as equals
- b. All members have the same educational needs and have experienced similar problems (e.g., managing diabetes)
- c. Members experience a decrease in isolation and frustration as knowledge increases
- d. Members have identified the problem and generally are motivated to manage more effectively
- e. Nurse leader is able to educate more people more efficiently using a group structure
- f. Members aid one another as they learn together, and share information and experiences

# Hierarchy of Needs

Figure 1-1: Maslow's Hierarchy of Needs.

**FIGURE 1-1** Maslow's Hierarchy of Needs. (Redrawn from Maslow AH: *Motivation and personality*, Upper Saddle River, NJ, 1970, Prentice Hall.)

- A Need to survive: physiologic needs for air, food, and water
- B Need for safety and comfort: physical and psychologic security
- C Interpersonal needs: social needs for love and acceptance
- D Intrapersonal needs: self-esteem and self-actualization

# Individual Factors Affecting Health

A Physiologic capacity: all diseases and conditions have a genomic component; genomics refers to the study of genes and their interactions with other genes, the environment, and psychosocial factors

B Developmental level

1. Infant: must adapt to a new environment; stress caused by transition from intrauterine to extrauterine living is compounded for infant with a congenital problem
2. Child: maturation involves physical, functional, and emotional growth; it is an ever-changing process that produces stress; disabilities add factors that may quantitatively or qualitatively affect maturation
3. Adolescent: experiences physical, psychologic, and social growth spurt; asks, "Who am I?" while developing self-image; limitations cause additional stress during identity formation
4. Adult: expected to be independent, productive, provide for self and family; if one cannot partially or totally accomplish this, additional stress occurs
5. Older adult: American society tends to value youth and devalue old age; many older adults are experiencing multiple stresses (e.g., loss of loved ones, changes in lifestyle, loss of physical vigor, and thought of approaching death) at a time when ability to adapt is compromised by anatomic, physiologic, and psychologic alterations that occur during the aging process

C Intelligence: genetic intellectual potential; amount of formal/informal education; level of intellectual development; and ability to reason, conceptualize, and translate words into actions

D Level of self-esteem: attitude that reflects individual's perception of self-worth; personal subjective judgment of oneself; positively influenced by success; negatively influenced by loss of independence and unacceptable change in role

E Experiential background: knowledge derived from one's own actions, observations, or perceptions; maturation, culture, and environment influence individual's experiential foundation

F Level of motivation: internal desire or incentive to accomplish goals

G Values: factors that are important to individual; often influenced by culture and religion

H Religion: deep personal belief in higher force than humanity

I Socioeconomic status: measure of relative social and economic standing based on income, education, and occupation

J Social interaction: ability to clearly communicate needs and desires to others; support systems

K Stress control: development of varied effective coping skills

# Stress Response

All human beings must be able to perceive and interpret stimuli to interact with the environment

1. Perception and cognitive functioning influenced by
  - a. Nature of stimuli
  - b. Culture, beliefs, attitudes, and age
  - c. Past experiences
  - d. Present physical and emotional needs
2. Personality development is influenced by ability to perceive and interpret stimuli
  - a. External world is internalized through these processes
  - b. External world may in turn be distorted by perceptions

Selye's general adaptation syndrome (GAS) is body's nonspecific physiologic response to stress; occurs in three stages: alarm, resistance, and exhaustion

1. Stress produces wear and tear on body; can be internal or external, beneficial or detrimental, and always elicits some response from or change in the individual
2. Alarm phase: sympathetic nervous system prepares body's physiologic defense for fight or flight by stimulating adrenal medulla to secrete epinephrine and norepinephrine; adrenocortical hormones (aldosterone and cortisol) are secreted (Figure 1-2: Fight-or-flight response)

**FIGURE 1-2** Fight-or-flight response. (From Harkreader H, Hogan MA, Thobaben M: *Fundamentals of nursing: caring and clinical judgment*, ed 3, St. Louis, 2007, Saunders.)

- Heartbeat increases to pump more blood to muscles
  - Peripheral blood vessels constrict to provide more blood to vital organs
  - Bronchioles dilate, and breathing becomes rapid and deep to supply more oxygen to cells
  - Pupils dilate to increase vision
  - Liver releases glucose for quick energy
  - Prothrombin time is shortened to protect body from loss of blood in event of injury
  - Sodium is retained to maintain blood volume
- Resistive stage: when stress continues, increased secretion of cortisone enables body to cope with stress
  - Exhaustion: if stress continues and responses are no longer effective, the last stage is

exhaustion and death

C Local inflammatory response: body's nonspecific response of tissue to injury or infection

1. Erythema (redness): histamine is released at site of injury, causing vasodilation (hyperemia)
2. Heat: vasodilation brings more core-warmed blood to area
3. Edema (swelling): histamine causes increased capillary permeability, allowing fluid, protein, and white blood cells (WBCs) to move into interstitial space
4. Pain: nerve endings are irritated by chemical mediators (e.g., serotonin, prostaglandin, and kinins) and pressure from edema
5. Loss of function: a protective response because of pain and edema

# Grieving Process

## Basic Concepts

- A Loss is experienced when something of value (e.g., object, person) is changed or gone
1. Actual: can be validated by others (e.g., death of spouse)
  2. Perceived: experienced internally; cannot be verified by others (e.g., loss of youth)
  3. Anticipatory: occurs before loss is experienced (e.g., scheduled amputation)
- B Grief: response to an actual or perceived loss
1. Bereavement: emotional response to loss
  2. Mourning: behavioral response to loss; influenced by culture

## Theorists: Stages of Grieving

- A Kübler-Ross: denial, anger, bargaining, depression, acceptance
- B Lindemann: somatic distress, preoccupation with image of the deceased, guilt, hostile reactions, loss of patterns of conduct
- C Engle: shock/disbelief, developing awareness, and restitution/resolution

## Grieving Process and Nursing Care

See [Table 1-1](#): Grieving Process and Nursing Care.

**Table 1-1**  
**Grieving Process and Nursing Care**

Stage of Grieving	Client Response	Nursing Care
Denial, disbelief	Disbelief, intellectualization	Accept response but do not reinforce denial
Anger, hostility	Verbally hostile	Do not become defensive, meet client needs
Bargaining	Seeks to avoid loss, may express feelings of guilt	Listen attentively, refer to spiritual counselor if appropriate
Depression, sadness	Grieves about what may never be, may be verbal or withdrawn	Listen attentively, sit quietly, use touch if appropriate
Acceptance, resolution	Comes to terms with loss, may make future plans, may have decreased interest in people and surroundings	Be quiet but available, help family to accept client's behavior

# Health-Illness Continuum and Rehabilitation

A Health-illness continuum: concept reflecting dynamic state of health in which one end of continuum represents high-level wellness and the other death

## B Rehabilitation

1. Assists clients to attain maximum level of wellness on continuum after negative change in health; involves establishing lost function while expanding, maintaining, and supporting limited remaining function
2. Focuses on interventions that improve quality of life rather than saving life
3. Involves client, family, health care team, community, and society; not an isolated process
4. Socially significant because health problems cause disabilities that are costly personally and financially (both to individual and society)
5. Increased numbers of individuals requiring rehabilitation
  - a. Advances in technology and health science have increased survival rates from birth defects, traumatic injuries, and infection
  - b. Aging has increased incidence of chronic illness

# Type of Condition Affecting Client

A Acute illness: caused by health problem that produces signs and symptoms abruptly and runs a short course; may develop into long-term illness

B Chronic illness: caused by health problem that produces signs and symptoms over time and runs a long course

1. Exacerbation: period when chronic illness becomes more active and recurrence of pronounced signs and symptoms of disease occur
2. Remission: period when chronic illness is controlled, and signs and symptoms are reduced or not obvious
3. Progressive degeneration: continuous deterioration or increased impairment of a person's physical state

C Terminal illness: caused by health problem that is expected to result in death, often within 6 months; focus of hospice and palliative care is improving quality of life, rather than cure, by meeting client's physical, psychosocial, and spiritual needs

# Level of Preventive Care

## A Primary prevention

1. Interventions aimed at health promotion; precedes disease or disability
2. Examples
  - a. Following a heart-healthy diet
  - b. Avoiding smoking
  - c. Being immunized
  - d. Maintaining ideal weight
  - e. Exercise

## B Secondary prevention

1. Interventions directed at diagnosis and prompt intervention; prevents extension of disease or development of complications
2. Examples
  - a. Performing monthly self breast and testicular examinations
  - b. Having routine screening tests (e.g., mammography, colonoscopy, Pap smear)

## C Tertiary prevention

1. Interventions that minimize effects of long-term disease or disability; maximizes individual's potential after disease or disability occurs; includes rehabilitative and end-of-life care
2. Examples
  - a. Adhering to rehabilitation programs after brain attack (cerebrovascular accident) or head trauma
  - b. Participating in a cardiac rehabilitation program
  - c. Learning to walk after amputation or joint replacement
  - d. Palliative care to support quality of life for clients and family members

# CHAPTER 2

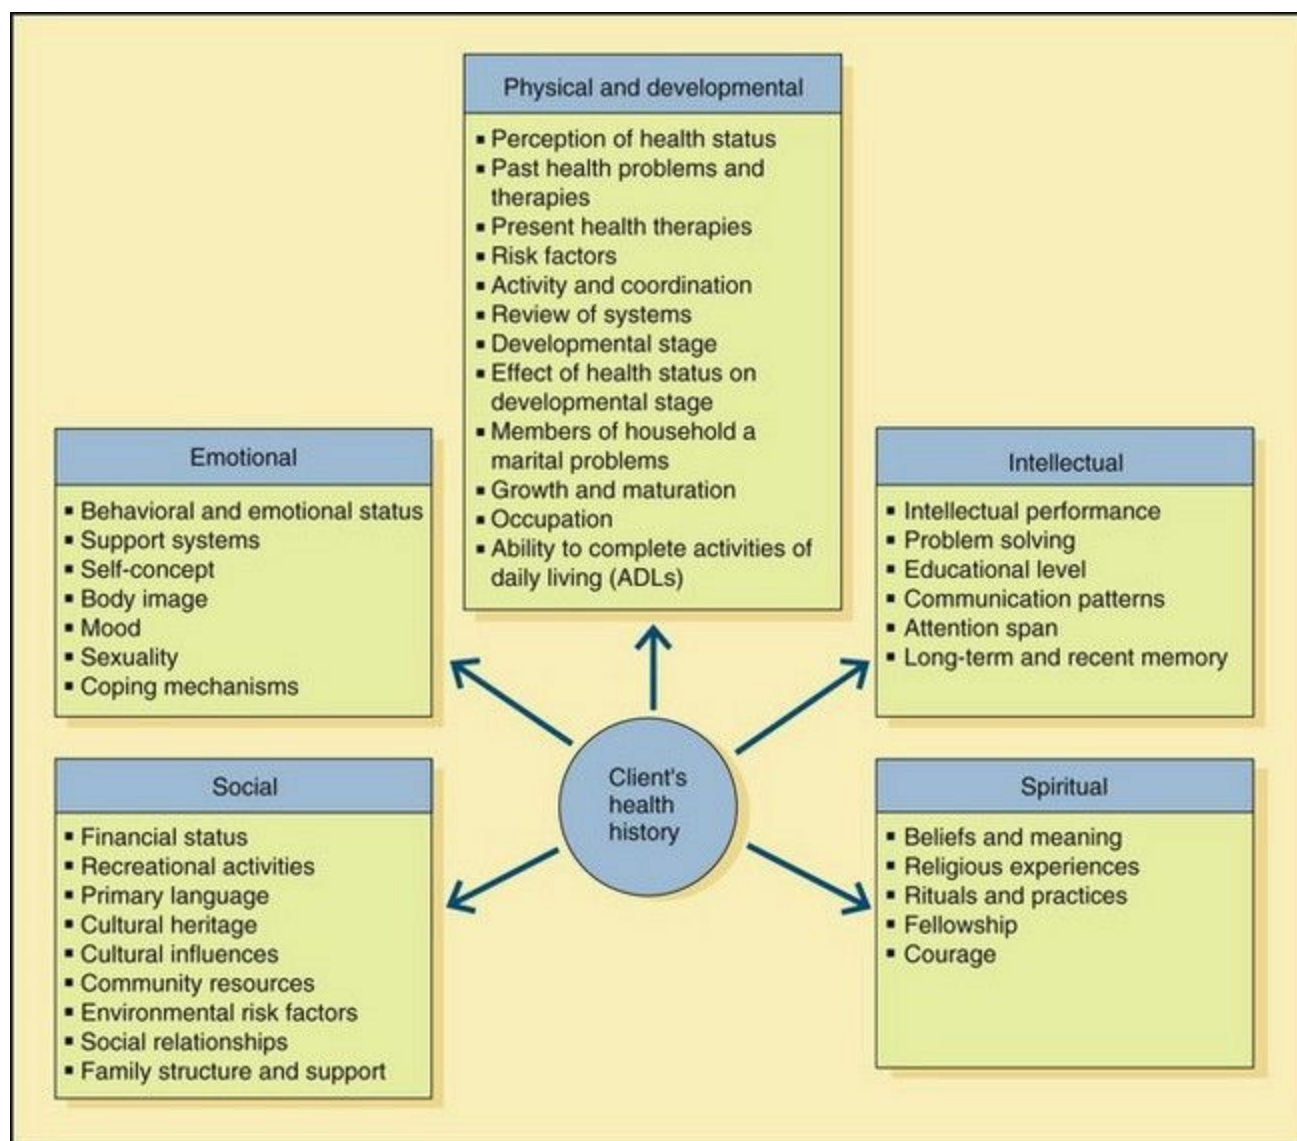

# Basics of Nursing Practice

---

# Nursing Process

## A Assessment/Analysis

1. Types of data: objective (overt, measurable, detected by physical assessment); subjective (covert, feelings, sensations, and symptoms verbalized by client)
2. Sources of data: client (primary); family/friends, health care team members, clinical record and other documents, textbooks (secondary)
3. Methods of data collection: interviewing, observation of nonverbal cues, congruency between verbal and nonverbal data, physical assessment (e.g., observation, palpation, auscultation, percussion) (**Figure 2-1: Dimensions for gathering data for a health history**)

**FIGURE 2-1** Dimensions for gathering data for a health history. (From Potter PA, Perry AG: *Fundamentals of nursing*, ed 7, St. Louis, 2009, Mosby.)

4. Management of data: screening, organizing, and grouping/clustering significant defining characteristics and related information
5. Identification of client's problem, concerns, or deficits that can be altered by nursing

interventions

## B Planning/Implementation

### 1. Establish client outcomes

- a. Outcomes are expected changes in client's behavior, activity, or physical state
- b. Outcomes must be objective, achievable, and measurable, and include a realistic period for accomplishment to determine whether outcome has been achieved

### 2. Collaborate with client, family/significant others, and appropriate health care team members to formulate a plan to reach identified outcomes; preparation for discharge begins at admission

### 3. Establish priorities of care using Maslow's Hierarchy of Needs (see [Figure 1-1](#))

### 4. Administer plan of care

## C Evaluation/Outcomes

### 1. Assess client's response to care

### 2. Compare actual outcome to expected outcome

### 3. If outcome is not reached, previous steps must be examined to determine reason

### 4. Plan of care may need to be revised

### 5. Priorities may require reordering because process of evaluation is ongoing

# Ensuring Quality Health Care

## A Responsibility

1. The Joint Commission (TJC)
2. Agency-based quality assurance (QA) and quality improvement (QI) programs
3. Individual members of health team

## B Practices

1. TJC National Patient Safety Goals (e.g., increasing accuracy of client identification, improving effectiveness of communication among members of health team, reducing risk of health care–associated infections and falls, improving safety of medication administration)
2. TJC standardized performance measures (e.g., core measures) to determine compliance with standards of care
3. Evidence-based practice (EBP) involves using research findings, experience, or client values to guide clinical decision making
  - a. Nurses must evaluate and participate in research that improves quality of nursing care
  - b. Levels of evidence refer to strength of support for a particular nursing strategy; levels of support range from systematic review of all relevant randomized controlled trials (RCTs) to reports of a committee of experts
4. Identification of sentinel events
  - a. An unexpected occurrence that leads to risk of or actual physical or psychological injury, or death
  - b. Root cause analysis identifies factors contributing to violations of practice associated with the event
  - c. Development and evaluation of plan to prevent recurrences

# Communication

## Basic Concepts

- A Need to communicate is universal
- B Through communication, humans maintain contact with reality, validate findings with others to interpret reality, and develop a concept of self in relation to others
- C Validation is enhanced when communication conveys an understanding of feelings
- D Communication is learned through the process of acculturation
- E Communication is the avenue used to make needs known and to satisfy needs

## Communication Process

- A Requires: sender, message, receiver, and response
- B Modes of communication
  1. Verbal: related to anything associated with spoken word; includes speaking, writing, use of language or symbols, and arrangements of words or phrases; hearing is essential to development of effective speech because one learns to form words by hearing words of others; includes pace, intonation, simplicity, clarity, brevity, timing, relevance, adaptability, credibility, and humor
  2. Nonverbal: related to messages sent and received without use of words and is expressed through appearance, body motions, use of space, nonverbal sounds, personal appearance, posture, gait, facial expression, gestures, and eye contact; more accurately conveys feelings because behavior is less consciously controlled than verbal communication
  3. Confusion arises when there is a difference between verbal and nonverbal message received (lack of congruence in overt and covert messages)
- C Themes of communication: recurring thoughts and ideas that give insight into what client is feeling and that tie communication together
  1. Content: conversation may appear superficial, but attention to underlying theme helps nurse identify problem areas while providing insight into client's self-concept
  2. Mood: emotion or affect that client communicates to nurse; includes personal appearance, facial expressions, and gestures that reflect client's mood and feelings
  3. Interaction: how client reacts or interacts with nurse; includes how client relates and what role is assumed when communicating with nurse and others
- D Factors affecting communication process: language, psychosociocultural influences, intellectual development, gender, values and perceptions, personal space (intimate, personal, social, and public), territoriality, roles and relationships, environment, congruence of verbal and nonverbal messages, and interpersonal attitudes
- E Barriers to communication
  1. Variation in culture, language, and education
  2. Problems in hearing, speech, or comprehension (ineffective reception or perception)
  3. Refusal to listen to another point of view

4. Use of selective inattention; may cause an interruption or distortion of messages
5. Environmental considerations (e.g., noise, lack of privacy, room temperature)
6. Psychologic or physiologic discomfort (e.g., anxiety, hunger, pain)

## The Nurse-Client Relationship

### A Phases in a therapeutic relationship

1. Preinteraction: begins before nurse's initial contact with client
  - a. Self-exploration involves acknowledging one's own feelings, fears, personal values, and attitudes, including identification of misconceptions and prejudices that are socially learned
  - b. Self-awareness is necessary before establishing a relationship with others
  - c. Tasks include gathering data about client and planning for first interaction with client
2. Orientation or introductory: the nurse, who initially is in the role of stranger, establishes a trusting relationship with the client by consistency in communication and actions; clients should never be pushed to discuss areas of concern that are upsetting to them
  - a. Introduction of nurse, explanation of nurse's role in multidisciplinary team, and purpose of interaction
  - b. Contract outlining mutually agreed upon goals is set
  - c. Confidentiality issues are discussed, and client rights are upheld
  - d. Termination begins during orientation phase by establishing time parameters
3. Working: nurse and client discuss areas of concern, and client is helped to plan, implement, and evaluate a course of action
  - a. Transference and countertransference may become an issue (see [Chapter 16, Therapeutic Nurse-Client Relationship, Overview](#))
  - b. Anxiety levels may increase; acting-out behaviors can and do occur; resistance to change need to be anticipated, identified, and addressed
  - c. Problems need to be discussed and resolved
  - d. New adaptive behaviors can be learned
4. Termination: end of therapeutic relationship between nurse and client; spacing meetings further apart near end facilitates termination
  - a. Goals and objectives achieved are summarized
  - b. Positive adaptive behaviors are reinforced
  - c. Feelings and experiences for both client and nurse are shared
  - d. Rejection, anger, regression, or other negative behaviors may be expressed as a means of coping with the impending termination of the relationship

### B Considerations fundamental to a therapeutic relationship

1. Client is unique and worthy of respect
2. Client needs to feel accepted
  - a. Acceptance is an active process designed to convey respect for another through empathetic understanding

- b. Acceptance of others implies and requires acceptance of self
  - c. Nurse's identification of own attitudes and feelings and their effect on perception is necessary before developing a nonjudgmental attitude
  - d. Acceptance requires that clients be permitted and even encouraged to express feelings and attitudes even though they may be divergent from a general viewpoint; setting limits might be required for inappropriate behavior in a manner that does not reject client
  - e. Acceptance requires a nonjudgmental environment
3. The high stress/anxiety of most health settings is created in part by the health problem itself; treatments and procedures; nontherapeutic behavior of personnel; strange environment; inability to use usual coping skills (e.g., exercise, talking with friends); and change in lifestyle, body image, and/or self-concept
  4. Previous patterns of behavior may become inadequate under stress: health problems may produce change in family or community
  5. Health problems may produce change in self-perception and role identity
  6. All behavior has meaning and usually results from an attempt to cope with stress or anxiety
  7. Value systems influence behavior
  8. Cultural differences exist among people; one's own culture is an integral part of an individual
  9. Personal meaning of experiences to clients is important
  10. Clients have potential for growth
    - a. Clients need to learn about their own behaviors
    - b. Exchanging experiences with others provides a new learning environment and reassurance that reactions are valid and feelings are shared
    - c. Participating in groups increases knowledge of interpersonal relationships and helps individuals to identify strengths and resources
    - d. Identifying client's strengths and resources emphasizes positive attributes which form a basis for future growth
  11. Behavioral changes are possible only when client has other defenses to maintain equilibrium
  12. Providing information may not alter client's behavior
  13. Use of defense mechanisms needs to be identified
  14. Maintaining confidentiality supports a trusting relationship
  15. Use of therapeutic interviewing techniques communicates acceptance and supports expression of feelings
  16. Nurses need to identify and cope with their own anxiety

#### C Support of therapeutic communication

1. Maintenance of a nonjudgmental environment
2. Implementation of actions that support dignity and worth
  - a. Maintaining eye contact when communicating
  - b. Using names rather than labels such as room numbers or diagnoses; approach client as a person with difficulties, not as a "difficult person"

- c. Providing privacy
- d. Maintaining confidentiality
- e. Being courteous toward client, family, visitors, and members of the health team
- f. Permitting personal possessions when practical
- g. Providing explanations at client's level of understanding

3. Encouragement of participation in problem solving and decision making

4. Spending time with client

5. Fostering trust through honesty, consistency, reliability, and competence

6. Answering client call bell immediately

D Use of therapeutic techniques to facilitate communication

1. Reflection of feelings, attitudes, and words: helps client to identify feelings

2. Open-ended questions: permit client to focus on issues

3. Paraphrasing: rephrasing of feeling or thought in similar words to convey that message was understood or to provide an opportunity for clarification if necessary

4. Silence: provides nurse and client with necessary time for reflecting about what is being discussed and allows time to formulate a response

5. Touch: conveys caring, but its effectiveness can vary among individuals and cultures

6. Clarification: helps to ensure that message is understood as intended

7. Direct questions: facilitate collection of objective data but may block expression of feelings

E Avoidance of nontherapeutic communication

1. Any overt/covert response conveys a judgmental (approval or disapproval) or superior attitude

2. Direct personal questions are probing or invasive

3. Ridicule conveys a hostile attitude

4. Talking about one's own problems and not listening convey a self-serving attitude and loss of interest in the client

5. Stereotyping devalues uniqueness of the client

6. Changing the subject conveys a lack of interest in the client's concerns

7. False reassurance eventually results in lack of trust

8. Minimizing concerns is demeaning

9. Asking for explanations using the word "why" may put client on the defensive

10. Using clichés minimizes concerns

11. Using terms of endearment such as "honey" is demeaning

12. Defensive responses shut off communication

13. Giving advice interferes with the client's ability to problem solve

14. Challenging client to defend a position/feeling may put client on the defensive

# Teaching-Learning

A Learning: involves a change in or acquisition of new behavior and takes place within the individual

1. Cognitive: knowledge
2. Psychomotor: skill performance
3. Affective: attitudes, emotions

B Motivation: desire for change in response to identified need

1. Intrinsic motivation: comes from within the learner; preferred to extrinsic motivation
2. Extrinsic motivation: comes from outside the learner
3. Readiness to learn (physical, emotional, and cognitive)
  - a. Awareness of health problem and implications
  - b. Willingness to ask questions
  - c. Demonstration of indirect health-seeking behaviors
  - d. Absence of acute distress reactions (e.g., severe anxiety, pain) that inhibit learning
4. Culture (e.g., language, values, beliefs)
5. Physical abilities (e.g., vision, hearing)
6. Cognitive ability (e.g., intelligence, developmental level, education)
7. Support systems

C Teaching: activities that result in learning

1. Involving client and family to individualize teaching plan
2. Exhibiting nonjudgmental attitude
3. Building on client's prior knowledge
4. Incorporating a variety of strategies (e.g., discussion, demonstration, practice, role playing, discovery, audiovisual aids, computer-assisted instruction) that involve multiple senses (e.g., sight, hearing, touch)
5. Establishing short-term achievable learning objectives to maintain motivation
6. Using positive reinforcement; learning by success or positive rewards is preferable to learning by failure or negative consequences
7. Establishing an environment conducive to learning (e.g., safe, limited noise, reduced distractions)
8. Evaluating client learning: observation of behavior; written tests; self-reports

# Leadership and Management

## Principles of Leadership

A Leader: influences actions of individual or group toward specific goals; leadership style is affected by

1. Needs of group members
2. Characteristics of leader (e.g., personality, experiential background)
3. Cultural climate of organization

B Types of leadership

1. Authoritarian or autocratic leader: uses leadership role for power; little communicating and interrelating between leader and group; leader sets goals, plans, makes decisions, and evaluates actions taken
2. Democratic leader: uses leadership role to stimulate others to achieve collective goal; fair and logical; encourages interrelating among members; weaknesses as well as strengths are accepted; contributions of all members are fostered and used; responsibilities for action are shared between leader and group
3. Emotional leader: reflects feeling tones, norms, and values of group
4. Laissez-faire leader: passive and nondirective; assumes participant-observer role and exerts little control or guidance over group behavior; input and control are minimal
5. Bureaucratic leader: rigid; assumes a role that is determined by formal criteria or rules that are inherent in an organization; leader is not emotionally involved and avoids interrelating with group members
6. Charismatic leader: can assume any of above behaviors because group attributes supernatural power to this person or the office and frequently follows directions without question

C Effective leaders modify style to fit changing circumstances, problems, and people (e.g., autocratic style is appropriate in emergency situations; democratic style is appropriate when group acceptance and participation are essential; laissez-faire leadership is appropriate when group members are knowledgeable and capable of self-direction)

D Interpersonal influence depends on

1. Knowledge of human behavior
2. Sensitivity to others feelings, values, and problems
3. Ability to communicate (see [Communication Process](#))

E Leader's success is influenced by ability to respond to group needs and by members' perceptions of effectiveness

1. Role of leader is to serve individual's or group's needs; some roles are task-oriented and help group accomplish goals; other roles are more process-oriented and help group members to communicate effectively
2. Power is a leader's source of influence
  - a. Positional power: acquired through position of leader in hierarchy of organization
  - b. Professional power: acquired through knowledge or expertise displayed by leader

and/or perceived by followers

3. Leadership moves from one person to another as changes in situation occur  
F Leadership process requires critical thinking skills associated with problem solving  
G Leader as change agent: movement from goal setting to goal achievement involves change

1. Need for change requires understanding by those effecting change, as well as by those affected by change
2. Process of change includes communication, planning, participation, and evaluation by individual or group affected
3. Change is more acceptable when it is consistent with beliefs; is planned; follows a number of successful rather than unsuccessful series of changes; is initiated after other changes are absorbed rather than during the confusion of a major change; does not threaten security; and when affected individuals or groups have participated in its creation
4. Resistance to change is normal; it should be expected and addressed in planning

## Principles of Management

A Dynamic process that involves mobilization of team members and resources to achieve outcomes that are consistent with the goals of the organization and standards of regulatory agencies

1. Goal is to provide the highest quality of client care while controlling costs
2. Involves protection of clients and health care personnel
3. Desired outcomes are identified through clinical decision making based on assessment
4. Shared mental model by the team helps motivate its members to achieve the desired outcomes and seek continued quality improvement

B Manager is formal leader given authority and accountability by the organization

1. Authority: positional power or administrative authority that gives the manager the right to direct the action of others
2. Accountability: willingness to accept professional and legal responsibility for one's actions, outcomes, and consequences

C Skills of an effective manager

1. Communication: climate of mutual respect is essential for open, ongoing exchange of information required for continued improvement of health care delivery
2. Leadership: promotes and models teamwork; motivates accomplishment of outcomes and personal/professional development by team members; team members' acceptance of manager as leader is characteristic of high-performing team
3. Conflict resolution and negotiating: facilitate cooperation among team members, attainment of organizational support, and interdisciplinary collaboration
4. Organizational skills: needed for effective and efficient functioning; involve multitasking and ability to adjust plan based on changes in data
5. Time management: involves setting time frame for accomplishment of identified outcomes, controlling interruptions, avoiding duplication of effort, and evaluation to

improve use of time

6. Priority setting: life-threatening, urgent, unstable, and complex problems with unpredictable outcomes receive higher priority and require higher-level skills to manage than stable problems with predictable outcomes
7. Resource utilization: human, material, and fiscal resources; involves delegation and budgeting

## Delegation

A Definition: transfer of responsibility for a specific nursing activity in a specific situation to a member of the nursing team deemed competent to perform the activity; nurse who delegates retains accountability for the performance of the activity and client outcome

B Steps of delegation process

1. Assessment and planning
  - a. Degree of urgency, complexity, and stability of client problem
  - b. Ability of team member to perform activity: Nurse Practice Act, organization's policies and procedures, individual's education and experience
    - (1) Registered Professional Nurses (RNs): provide comprehensive client care based on state Nurse Practice Act, including assessment, diagnosis, planning, teaching, delegating, administering medications via all routes of delivery
    - (2) Licensed Practical Nurses (LPNs) or Licensed Vocational Nurses (LVNs): provide nursing care to clients based on state Nurse Practice Act, including dressing changes, catheterization, tube feedings, medication administration (e.g., oral, topical, intramuscular, and subcutaneous)
    - (3) Unlicensed assistive personnel (UAP) who may be referred to by a variety of titles (e.g., certified nurse assistant, patient care assistant, nursing assistant, nurse aide, orderly): bathing, feeding, toileting, repositioning, transferring, obtaining measurements (e.g., vital signs, intake and output, height and weight)
  - c. Five rights of delegation: right task, right situation, right person, right direction/communication, right supervision/evaluation
2. Delegation of nursing activity to team member
  - a. Specific activity and guidelines for performance/reporting are communicated to team member
  - b. Team member understands and accepts responsibility for delegated activity
3. Supervision: type and frequency determined by stability of client, complexity of activity, and ability of team member
4. Evaluation: continuous process to determine effectiveness of delegation in achievement of desired client outcomes and identification of opportunities for improvement

# Nursing Practice and the Law

## Torts and Crimes Important to Nurses

### A Torts

1. Violations of civil law against a person or person's property
  - a. Commission: inappropriate action
  - b. Omission: lack of appropriate action
2. Unintentional torts
  - a. Negligence: measurement of negligence is "reasonableness"; involves exposure of person or property of another to unreasonable risk for injury by acts of commission or omission
  - b. Malpractice: negligence during professional practice; any unreasonable lack of skill in professional duties or illegal or immoral conduct that results in injury to or death of a client; involves violation of standards of nursing practice
  - c. Examples of malpractice/negligence: leaving surgical sponges inside a client; causing burns; medication errors; failure to prevent falls; incompetent assessment leading to subsequent inappropriate actions; improper identification of clients; carelessness in caring for a client's property
3. Tort is different from crime, but a serious tort can be tried as both a civil and criminal action
4. Reasonableness and prudence usually are determining factors in a judgment
5. Nurses are responsible for their own acts; also, employers may be held responsible under doctrine of *respondeat superior*; when responsibility is shared, nursing actions must lie within the scope of employment and legislation relating to nursing practice (e.g., Nurse Practice Acts)
6. Elements essential to prove negligence
  - a. Legally recognized duty of care to protect others against unreasonable risk
  - b. Failure to perform according to an established standard of conduct and care, which becomes breach of duty
  - c. Damage to client, which can be physical, emotional, and/or mental; physical harm is not necessary to establish liability for intentional torts
7. Good Samaritan laws protect health care professionals who administer first aid as volunteers in an emergency unless there is gross negligence or willful misconduct; it is presumed that nurses meet a level of care expected of a reasonably prudent professional with the same education
8. Intentional torts occur when a person does damage to another person in a willful way and without just cause and/or excuse
  - a. Assault: a mental or physical threat; knowingly threatening or attempting to do violence to another without touching the person; forcing a medication or treatment on a person who does not want it
  - b. Battery: touching or wounding a person in an offensive manner with or without intent to do harm

- c. Fraud: purposeful false presentation of facts to create deception; includes presenting false credentials for licensure or employment
- d. Invasion of privacy: involves privileged communication and unreasonable intrusion
  - (1) Encroachment or trespass on another's body includes any unwarranted operation, unauthorized touching, and unnecessary exposure or discussion of client's case unless authorized
  - (2) False imprisonment, even without force or malicious intent, includes intentional confinement without authorization, as well as threat of force or confining structures and/or clothing; it is not false imprisonment when it is necessary to protect an emotionally disturbed person from harming self or others
  - (3) Defamation involves communications, even if true, that cause a lowering of opinion of the person; includes slander (oral) and libel (written, pictured, telecast), both of which are dependent on communication to a third party

## B Crimes

1. Crime: an intentional wrong that violates societal law punishable by the state; the state is the complainant
  - a. Felony: serious crime, such as murder, punishable by prison term
  - b. Misdemeanor: less serious crime that is punishable by a fine and/or short-term imprisonment
2. Commission of a crime requires committing a deed contrary to criminal law or failing to act when there is legal obligation to act
3. Criminal conspiracy occurs when two or more persons agree to commit a crime
4. Giving aid to another in the commission of a crime makes the person equally guilty if there is awareness that a crime is being committed
5. Ignorance of the law usually is not an adequate defense
6. Property cannot be searched without a search warrant
7. Administration of opioids by a nurse is legal only when prescribed by a licensed health care provider; possession or sale of controlled substances by a nurse is illegal
8. If a nurse knowingly administers a drug that causes major disability or death, a crime may be charged

## Clients' Rights

A Clients have the right to choose their own health care provider, health care agency, or medical insurance based on availability and ability to meet costs free of discrimination; to be given treatment in an emergency; to receive an accepted standard of care; to execute informed consent; to decide whether to be involved with research or teaching; to be treated in confidentiality; to have their personal property protected; and to refuse treatment

B Statutory restrictions may be imposed on client's rights

C The United States government has set stringent rules about using human subjects in

research

## ***Informed Consent***

A Consent is essential for any treatment, except in an emergency where failure to institute treatment may constitute negligence; routine procedures are covered by a consent signed on admission

B In an emergency situation, two health care providers may sign consent for a client when failure to intervene may cause death or when common law permits administration of health care to unconscious or mentally incompetent persons in emergency situations; if family members voice opposition, a court order may be required

C Informed consent must include an explanation of treatment to be done with presentation of advantages and disadvantages and description of possible alternatives; there must be time for decision making with an absence of undue pressure; the explanation and decision making must occur before sedation is given

D Legal consent requires that it be voluntary, authorizes the specific treatment or care and the person giving the treatment or care, and that it is given by a person with the legal and mental capacity to consent based on an informed decision; clients 18 years or older and emancipated minors are legally able to give consent; emancipated minors include individuals who are younger than 18 years of age and are either married, a parent, or legally emancipated by the courts

## ***Death with Dignity: Legal, Ethical, and Emotional Issues***

A Death with dignity includes two fundamental factors: individual has control over one's own life, and worth of individual as a unique being is demonstrated through respect even after death

B Laws empower clients to have as much control as possible over their care and activities, recognizing that pain, helplessness, and hopelessness lead to despair

C Public should be educated about advance directives through literature distribution and discussions; appropriateness of care for terminally ill clients derived from continuous quality management; and availability and accessibility of palliative care services

D Criteria of death: every state has increasingly been forced to define death (many using signs of brain death as the indicator) and to define when death occurs

E Do not resuscitate (DNR) status

1. All health care agencies are required to have DNR procedures to meet accreditation standards
2. DNR orders must be included in clients' clinical records and periodically updated
3. Most important factors considered are client's wishes, prognosis, ability to cope, and whether there is a reasonable possibility that an acceptable quality of life will be achieved through CPR
4. In many states, the right to request a DNR status is mandated within the Patient Care Partnership (Patient's Bill of Rights); health care agencies must provide education on the issue of DNR to clients and families

5. DNR orders require a team decision; client and family must be included in decision-making process

F Advance directives

1. Concepts

- a. Living wills: allow clients to state their wish to die in certain situations and not have life prolonged by using medications, artificial means, or heroic measures; living wills set forth clients' wishes regarding health care decisions and include which medical procedures are authorized or declined
- b. Health care proxy: designates an agent to make health care decisions according to client's plans or wishes; includes power to stop or withhold treatment necessary for life when client is unable to do so

2. Advantages of living wills and health care proxies: permit expression of a client's preferences; promote communication between client and caregivers; foster respect for a client as a person; and support belief that a client has rights to self-determination

3. Client's Self-Determination Act of 1991: mandates that health care agencies receiving Medicare and Medicaid reimbursement advise clients of their right to advance directives

## The Nurse's Rights and Responsibilities

A Performs within standards of practice for the profession

B Licensure required to practice as a nurse; each state defines scope of professional practice

1. Independent interventions: nurse-initiated actions based on nursing's body of knowledge and scope of practice that do not require a health care provider's order (e.g., teaching, assessment, meeting hygienic needs)

2. Dependent interventions: health care provider-directed interventions or health care provider-established protocols that require specific nursing responsibilities and technical knowledge (e.g., administration of medications, tube feedings, and dressing changes)

3. Collaborative interventions: nursing actions that require cooperation and coordination with other health professionals (e.g., coordinating intervention from physical therapist and social workers to meet needs of a client before discharge)

C Intervenes to protect clients from incorrect, unethical, and/or illegal actions by any person delivering health care

D Participates in and promotes growth of the nursing profession and own competence

E Reports any suspected child abuse to appropriate authority; reporting is mandatory and does not incur legal liability

F Code of ethics (e.g., American Nurses Association [ANA] Code of Ethics for Nurses) guides professional practice and reflects moral values of group

1. Basic terms: beneficence (promotion of good); nonmaleficence (avoidance of harm); justice (fairness); autonomy (self-determination); fidelity (faithfulness); veracity (truthfulness); accountability (answerable for one's own actions); responsibility

(dependable role performance); confidentiality (maintaining privacy)

2. Code of ethics is broader and more universal than laws but cannot override laws
  3. Ethical issues become legal issues through court case decisions or by legislative enactment
- G Obtains professional liability insurance

# Medication Administration

## Drug Effects

- A Desired effect (therapeutic effect): action for which drug is prescribed
  - B Adverse effect: harmful unintended reaction
  - C Toxic effect: serious adverse effect that occurs when plasma concentration of drug reaches dangerous, life-threatening level
  - D Side effect: response that is unrelated to desired action of drug
  - E Cumulative action: when repeated doses of the drug accumulate in body and exert greater biologic effect than the initial dose
  - F Drug dependence: physical or psychologic reliance on chemical agent resulting from continued use, abuse, or addiction
  - G Idiosyncratic response: individual's unique, unpredictable response
  - H Paradoxical reaction: response that contrasts sharply with usual, expected response
  - I Tolerance: ability to endure ordinarily injurious amounts of drug or decreasing effect obtained from established dose; requires increasing dose to possibly toxic level to maintain same effect
  - J Hypersensitivity: excessive allergic reaction to exogenous agent (e.g., drug, food)
- (Figure 2-2: Type I hypersensitivity reactions)

**FIGURE 2-2** Type I hypersensitivity reactions. Manifestations of allergic reactions as a result of type I hypersensitivity include itching, angioedema (swelling caused by exudation), edema of the larynx, urticaria (hives), bronchospasm (constriction of airways in the lungs), hypotension (low blood pressure), and dysrhythmias (irregular heartbeat) because of anaphylactic shock, and gastrointestinal cramping caused by inflammation of the gastrointestinal mucosa. (From McCance KL, Huether SE: *Pathophysiology: the biological basis for disease in adults and children*, ed 6, St. Louis, 2010, Mosby.)

1. Anaphylaxis: life-threatening episode of bronchial constriction and edema that obstructs airway and causes generalized vasodilation, which depletes circulating blood volume; occurs when an allergen is administered to an individual who has antibodies produced by prior use of the drug
  2. Urticaria: generalized pruritic skin eruptions or giant hives
  3. Angioedema: fluid accumulation in periorbital, oral, and respiratory tissues
  4. Delayed-reaction allergies: rash and fever occurring during drug therapy
- K Drugs and food may interact and alter therapeutic effect adversely
1. Antagonistic/inhibiting effect: one drug diminishing the effect of another (e.g., pseudoephedrine [Sudafed] decreases effectiveness of antihypertensives)
  2. Synergistic/potentiating effect: effect of two drugs is greater than either drug alone; often dose must be reduced

## Factors Influencing Dosage and Response

A Therapeutic index (TI): ratio between lethal dose and therapeutic dose; used as guide to safe dosing; a high TI is preferable to a low TI, which provides a narrow margin of safety

B Serum concentration of some drugs needs to be monitored; used as guide to safe dosing

1. Peak level: highest concentration of drug; usually within 1 to 2 hours after oral, 1 hour after intramuscular (IM), and 30 minutes after IV administration
2. Trough (residual) level: lowest concentration of drug; preferably within 15 minutes of next scheduled dose

C Concentration and duration of drug action are affected by

1. Individual factors (e.g., age, weight, gender, height, physiologic status, and genetic and environmental factors)
2. Characteristics of drug (e.g., rate of absorption, distribution, biotransformation, and excretion)
3. Inability of body to metabolize or excrete drug effectively (e.g., drug affinity for particular tissues, ineffectiveness of enzymes required for metabolism of drug, depressed function of tissues naturally metabolizing (often liver) or excreting drug (often kidneys))

D Membrane barriers (e.g., placental, blood-brain) may block or selectively pass drug from circulating fluids to protected areas

## Nursing Responsibilities Related to Medication Administration

A Consider that administration of medications is a dependent function requiring a legally written prescription that is not blindly followed

B Make appropriate assessments before administering medications

1. Identify client: ensure that client is wearing identification bracelet; scan bar codes or

use two identifiers such as client's name, birth date, and/or hospital number (these have reduced incidence of medication errors)

2. Identify medications client was taking before admission, and compare list to medications prescribed after admission to health care agency (medication reconciliation)
3. Question client regarding history of allergies; ensure that client is wearing an allergy bracelet and allergy information is in all appropriate places in clinical record
4. Determine if client is taking any over-the-counter (OTC) medications, herbal products, or alcohol that may interact with prescribed medications
5. Ensure ability to obtain and afford prescribed medications
6. Establish whether drug is still appropriate based on client's status
  - a. Compatibility of medications with other medications or substances in diet
  - b. Untoward or toxic manifestations to earlier doses
  - c. Serum drug levels for attainment of therapeutic level, toxic level, and peak and trough levels
  - d. Final desired result is attained

C Know common symbols, equivalents, abbreviations, and calculation of dosage; TJC recommends that the following should not be abbreviated: every day, every other day, right or left eye, both ears or eyes, units, cubic centimeters, morphine sulfate, and magnesium sulfate; subcutaneous can be indicated by the abbreviation Sub-Q or subQ; use a "0" before a decimal point for numbers less than 1; and no trailing "0" after a decimal

D Ensure traditional five rights of medication administration: right client, right medication, right dose, right route, right time

E Ensure additional five client rights related to medication administration: right client education, right documentation, right to refuse, right client assessment, right evaluation of client response

F Teach client about therapeutic effects, side/adverse effects, and any other pertinent information related to medication regimen

G Respect client's right to refuse medication

H Know common routes

1. Oral

- a. Most common, convenient, and least expensive
- b. Absorption is slow; may be unpredictable; may cause GI irritation
- c. Preparations include tablets, capsules, pills, powders, and liquids
  - (1) Sustained-release or enteric-coated preparations should not be crushed or broken
  - (2) Suspensions should be shaken well before pouring

2. Sublingual: placed under tongue; absorbed rapidly and directly into bloodstream

3. Parenteral: requires sterile technique ([Figure 2-3, A & B](#): Sites recommended for subcutaneous and IM injections)

**FIGURE 2-3** Sites recommended for subcutaneous (A) and intramuscular (B) injections. (From Young AP, Proctor DB: *Kinn's the medical assistant: an applied learning approach*, ed 11, St. Louis, 2011, Saunders.)

- a. Intradermal: small volume (usually 0.1 mL) under epidermis; most commonly used for allergy and tuberculin testing
- b. Subcutaneous: 0.5 to 2 mL into tissues just below skin
- c. Intramuscular: up to 3 mL into muscle depending on site; sites include ventrogluteal, dorsogluteal (not generally recommended because of proximity to large blood vessels and sciatic nerve), vastus lateralis, rectus femoris, and deltoid
- d. Intravenous: given directly into vein by continuous infusion, intermittent infusion (intravenous piggy back [IVPB]), intravenous push

4. Transdermal (through skin) preparations

5. Inhalation: metered-dose inhaler or nebulizer

6. Topical preparations: for localized effect on skin or in body cavities (e.g., bladder, eyes, ears, nose, vagina, oral cavity, and rectum); for systemic effect (e.g., rectal, nasal, sublingual)

I Calculate dosage of medications; use following formulas for ratio and proportion

1.

$$\frac{\text{Desired}}{\text{Have}} \times \frac{\text{Ordered dose}}{\text{Available dose}} = \frac{\text{Desired amount (e.g., tablets, mL)}}{\text{Available amount}}$$

2. Desired dose : Supplied dose :: Desired Amount : Available amount

J Evaluate client's response to medication

K Clearly and accurately record and report administration of medications and client's response; follow standard practice when counting, wasting, or documenting controlled substances

# CHAPTER 3

# Integral Aspects of Nursing Care

---

# Pain

## Overview

A Definition: universally unpleasant emotional and sensory experience that occurs in response to actual or potential tissue trauma or inflammation

1. Referred to as fifth vital sign
2. Subjective; pain is whatever client says it is
3. Perception of client's pain is influenced by multiple factors (e.g., previous pain experience and emotional, physical, and psychological status)

### B Types

1. Acute pain: mild to severe pain lasting less than 6 months; usually associated with specific injury; involves sympathetic nervous system response; leads to increased pulse rate and volume, rate, and depth of respirations, blood pressure (BP), and glucose level; urine production and peristalsis decrease
2. Chronic pain: mild to severe pain lasting longer than 6 months; associated with parasympathetic nervous system; client may not exhibit signs and symptoms associated with acute pain; may lead to depression and decreased functional status

### C Terminology

1. Pain threshold: minimum amount of stimulus required to cause sensation of pain
2. Pain tolerance: maximum pain a client is willing or able to endure
3. Referred pain: pain experienced in an area different from site of tissue trauma ([Figure 3-1](#): Common sites of referred pain)

**FIGURE 3-1** Common sites of referred pain. Note that the location of the pain may not be directly over or even near the site of the organ. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

4. Intractable pain: pain not relieved by conventional treatment
5. Neuropathic pain: pain caused by neurologic disturbance; may not be associated with tissue damage
6. Phantom pain: pain experienced in missing body part
7. Radiating pain: pain experienced at source and extending to other areas

## Review of Physiology

A Sensory neurons, nociceptors in peripheral nervous system, are stimulated by biochemical mediators (e.g., bradykinin, serotonin, histamine, potassium, and substance P) when there is mechanical, thermal, or chemical damage to tissue; viscera do not have special neurons for pain transmission; receptors respond to stretching, ischemia, and inflammation

B Pain impulses are transmitted to spinal column

1. A delta fibers: myelinated, large-diameter neurons
2. C fibers: unmyelinated, narrow-diameter neurons

C Impulse enters at dorsal horn and ascends spinothalamic tract to thalamus

D Impulse travels to basal areas of brain and to somatic sensory cortex

E Endogenous opioids, such as endorphins, are released and bind to receptors to modify pain transmission

F Gate-control theory suggests that stimulation of large-diameter fibers can block transmission of painful impulses through dorsal horn

## Nonpharmacologic Pain Management Strategies

A Acupuncture: insertion of disposable needles into meridians (energy pathways) to change energy flow; may use heat or electric stimulation

B Acupressure: finger pressure applied over meridians; less invasive but less effective than acupuncture

C Aroma therapy: plant oils applied topically or misted (e.g., ginger for arthritis or headaches, lavender to reduce anxiety associated with pain) have shown benefit

D Distraction: focuses client's attention away from pain

E Heat and cold: diminishes pain experience by stimulation of large sensory fibers (gate-control theory)

1. Cold promotes vasoconstriction, which helps reduce edema and promote local anesthesia
2. Heat promotes vasodilation, which enhances healing

F Imagery: calming, peaceful thoughts reduce pain perception

G Massage: stimulates large-diameter fibers, blocking pain transmission

H Reflexology: pressure applied to areas on feet, hands, or ears that correspond to specific body organ; may have calming effect through release of endorphins

I Sequential muscle relaxation: promotes relaxation and decreases anxiety, thereby reducing pain perception

- J Transcutaneous or percutaneous electric stimulation: stimulation of peripheral sensory nerve fibers blocks transmission of pain impulse
- K Therapeutic touch: use of hands near body to improve energy imbalances
- L Hypnosis: altered state of consciousness in which concentration is focused; believed that pain stimuli in brain are prevented from penetrating the conscious mind; also, may cause release of natural morphine-like substances (e.g., endorphins and enkephalins)

## Related Pharmacology

### ***Opioid Analgesics***

#### A Action

1. Bind to opiate receptors in central nervous system (CNS)
2. Result in diminished transmission and perception of pain impulse

B Examples: morphine (MS Contin), codeine, meperidine (Demerol), hydromorphone (Dilaudid), fentanyl (Duragesic, Sublimaze), tapentadol (Nucynta), hydrocodone (Hycodan); administered via oral, buccal, nasal spray, intramuscular (IM), subcutaneous, IV, transdermal, epidural, or rectal routes, depending on drug

#### C Major side effects

1. Respiratory depression
2. Lethargy
3. Mental cloudiness
4. Nausea and vomiting
5. Hypotension
6. Constipation
7. Urinary retention
8. Euphoria
9. Allergic reaction
10. Pruritus

#### D Nursing care

1. Monitor for side effects, especially for respiratory depression (e.g., decreased respiratory rate and depth, decreased oxygen saturation)
2. Institute measures to support respiratory function (e.g., encourage frequent turning, coughing, and deep breathing)
3. Ensure availability of opioid antagonist (e.g., naloxone, naltrexone [Vivitrol]) in case of overdose)
4. Ensure medications are renewed at required intervals
5. Keep accurate count of opioids
6. Use measures to promote elimination (e.g., provide fluids, roughage; encourage upright position)
7. Monitor and maintain therapeutic levels of medication; may take 24 hours to achieve when using transdermal route
8. Administer before pain becomes severe because analgesics are less effective when pain is severe

9. Teach how to use patient-controlled analgesia (PCA) pump for management of severe pain; program infusion pump for continuous basal dose, client-controlled bolus dose, and lockout time interval that allow client to control administration without overdose; may be IV, subcutaneous, or epidural
10. Maintain safety after administration of opioid analgesia
11. Instruct to keep medication in secure environment; dispose of excess doses by returning to pharmacy

## **Nonsteroidal Antiinflammatory Drugs (NSAIDs)**

### **A Action**

1. Act on peripheral nerve endings and decrease inflammatory mediators by inhibiting prostaglandin synthesis
2. Have analgesic, antiinflammatory, and antipyretic effects

**B Examples:** aspirin (Ecotrin), ibuprofen (Motrin, Advil), naproxen (Naprosyn, Aleve) (see Related Pharmacology, NSAIDs in [Chapter 11](#))

### **C Major side effects**

1. Gastrointestinal (GI) ulceration and bleeding are most common; tarry stools (melena)
2. Kidney and liver impairment
3. Nausea and vomiting
4. Constipation or diarrhea
5. Bone marrow depression and impaired coagulation
6. Visual disturbances, headache
7. Tinnitus (especially with aspirin)
8. Confusion
9. Seizures
10. Hypertension and fluid retention, especially with older adults

### **D Nursing care**

1. Administer with food or milk
2. Instruct to drink 6 to 8 glasses of water
3. Monitor for side effects
4. Monitor Complete blood count (CBC)
5. Monitor liver and kidney function
6. Teach to avoid alcohol or aspirin when taking other NSAIDs

## ***Other Nonopioid Analgesics***

### **A Action**

1. Analgesic effect may be caused by inhibition of CNS prostaglandin synthesis
2. No effect on peripheral prostaglandin synthesis; therefore no antiinflammatory action

**B Example:** acetaminophen (Tylenol)

**C Major side effects** are few if therapy is short term

1. Hemolytic anemia
2. Hepatotoxicity

3. Seizures
4. Coma and death

#### D Nursing care

1. Teach not to crush extended-relief products
2. Monitor CBC
3. Monitor liver function
4. Teach to avoid alcohol and other over-the-counter (OTC) products that contain acetaminophen (avoid exceeding maximum dose of 4 g daily)
5. Explain that acetaminophen can be taken concurrently with anticoagulants
6. Ensure availability of antidote for acetaminophen if there is a risk for toxicity (e.g., acetylcysteine [Acetadote])

## **General Nursing Care of Clients in Pain**

### **Assessment/Analysis**

1. Client's description of pain: location; intensity as measured by numeric rating scale of 0 to 10, Wong-Baker FACES Pain Rating Scale, FLACC Scale (Face, Legs, Activity, Cry, Consolability); character; onset; duration; and aggravating and alleviating factors
2. Associated signs and symptoms: increased vital signs (may be decreased with visceral pain), nausea, vomiting, diarrhea, diaphoresis
3. Nonverbal cues: distraught facial expression, rigid or self-splinting body posture
4. Contributing factors: age (older adults may expect pain or may fear addiction, so they may not complain), culture, past experience, anxiety, fear, uncertainty (lack of information), fatigue
5. Effect of pain on ability to perform activities of daily living (ADLs)

### **Planning/Implementation**

1. Individualize pain management based on client's needs and not on own personal experiences, biases, or cultural beliefs regarding pain
2. Monitor and document client's pain, associated symptoms, and response to pain management interventions
3. Use nonpharmacologic techniques
4. Administer prescribed analgesics and local anesthetics (see Pain, Related Pharmacology and [Perioperative Care, Related Pharmacology](#), Local Anesthetics)
5. Institute measures to counteract side effects of medications (e.g., increase fiber and fluids to prevent constipation associated with opioids)
6. Provide preoperative and postoperative care for clients requiring surgical intervention for pain management
  - a. Rhizotomy: posterior spinal nerve root is resected between ganglion and spinal cord, resulting in permanent loss of sensation; anterior root may be cut to alleviate pain usually associated with lung cancer
  - b. Cordotomy: alleviates intractable pain in trunk or lower extremities; transmission of

pain and temperature sensation is interrupted by creation of lesion in ascending tract; performed percutaneously using an electrode or surgically via laminectomy

c. Sympathectomy: controls ischemic and phantom limb pain

d. Dorsal column stimulator and peripheral nerve implant: direct attachment of electrode to sensory nerve; electrode is attached to a transmitter that is carried by client so electric stimulation can be administered as needed

## **Evaluation/Outcomes**

1. Reports a reduction in pain of equal to or less than 4 on numeric rating scale

2. Participates actively in ADLs

# Infection

## Review of Physiology (Immunity)

A Nonspecific immune response: directed against invading microbes

1. Body surface barriers: intact skin and mucosa, cilia, and mucus secretions
2. Antimicrobial secretions: oil of skin, tears, gastric juice, and vaginal secretions
3. Internal antimicrobial agents
  - a. Interferon: substance produced within cells in response to viral attack
  - b. Properdin (Factor P): protein agent in blood that destroys certain gram-negative bacteria and viruses
  - c. Lysozyme: destroys mainly gram-positive bacteria
4. Phagocytes (monocytes, macrophages): cells that ingest and destroy microbes; part of reticuloendothelial system
5. Inflammatory response
  - a. First stage: release of histamine and chemical mediators (e.g., prostaglandin, bradykinin) leads to vascular dilation and increased capillary permeability, resulting in signs of inflammation (e.g., pain, heat, redness, edema, and loss of function)
  - b. Second stage: exudate production
  - c. Third stage: reparative phase

B Specific immune response: directed against a specific pathogen (foreign protein) or its toxin; may be cell-mediated or humoral

1. Cell-mediated immunity
  - a. Occurs within cells of immune system
  - b. Involves T lymphocytes (e.g., T helper, T suppressor, T cytotoxic, lymphokines); each type plays a distinct role in immune response
  - c. Cluster designations: mature T cells carry markers on surface that permit them to be classified structurally (e.g., CD4 cells associated with acquired immunodeficiency syndrome [AIDS])
  - d. Functions of cell-mediated immunity
    - (1) Protect against most viral, fungal, protozoan, and slow-growing bacterial infections
    - (2) Reject histoincompatible grafts
    - (3) Cause skin hypersensitivity reactions (e.g., tuberculosis [TB] screening)
    - (4) Assists with diagnosis of malignancies
2. Humoral immunity: concerned with immune responses outside of cell; involves B lymphocytes that differentiate into plasma cells and secrete antibodies
  - a. Antigen: any substance, including allergen, that stimulates production of antibodies in body; typically, antigens are foreign proteins, most potent being microbial cells and their products
  - b. Antibody: immune substance produced by plasma cells; antibodies are gamma globulin molecules; commonly referred to as immunoglobulin (Ig)

- c. Complement-fixation: group of blood serum proteins needed in certain antigen-antibody reactions; both complement and antibody must be present for reaction to occur
- d. Types of immunoglobulins
  - (1) Immunoglobulin M (IgM) antibodies: first antibodies to be detected after exposure to antigen; protection from gram-negative bacteria
  - (2) Immunoglobulin G (IgG) antibodies: make up more than 75% of total immunoglobulins; highest increase in response to subsequent exposure to antigen; only immunoglobulin that passes placental barrier
  - (3) Immunoglobulin A (IgA) antibodies: present in blood, mucus, and human milk secretions; play important role against viral and respiratory pathogens
  - (4) Immunoglobulin E (IgE) antibodies: responsible for hypersensitivity and allergic responses; cause mast cells to release histamine; protection from parasites
  - (5) Immunoglobulin D (IgD) antibodies: help differentiate B lymphocytes

## C Types of immunity

- 1. Active immunity: antibodies formed in body
  - a. Natural active immunity: antibodies formed during course of disease; may provide lifelong immunity (e.g., measles, chickenpox, yellow fever, smallpox)
  - b. Artificial active immunity: vaccine or toxoid stimulate formation of homologous antibodies; revaccination (booster shot) often needed to sustain antibody titer (anamnestic effect) ([Figure 3-2: Recommended immunization schedules—United States 2011](#))

**Recommended Immunization Schedule for Persons Aged 0 Through 6 Years—United States • 2011**

Vaccine ▼	Age ►	Birth	1 month	2 months	4 months	6 months	12 months	15 months	18 months	19–23 months	2–3 years	4–6 years
Hepatitis B		HepB	HepB				HepB					
Rotavirus				RV	RV	RV						
Diphtheria, Tetanus, Pertussis				DTaP	DTaP	DTaP		DTaP				DTaP
<i>Haemophilus influenzae</i> type b				Hib	Hib	Hib		Hib				
Pneumococcal				PCV	PCV	PCV		PCV				PPSV
Inactivated Poliovirus				IPV	IPV			IPV				IPV
Influenza								Influenza (Yearly)				
Measles, Mumps, Rubella								MMR				MMR
Varicella								Varicella				Varicella
Hepatitis A								HepA (2 doses)				HepA Series
Meningococcal												MCV4

Range of recommended ages for all children
Range of recommended ages for certain high-risk groups

**Recommended Immunization Schedule for Persons Aged 7 Through 18 Years—United States • 2011**

Vaccine ▼	Age ►	7–10 years	11–12 years	13–18 years
Tetanus, Diphtheria, Pertussis			Tdap	Tdap
Human Papillomavirus			HPV (3 doses) (females)	HPV series
Meningococcal		MCV4	MCV4	MCV4
Influenza			Influenza (Yearly)	
Pneumococcal			Pneumococcal	
Hepatitis A			HepA Series	
Hepatitis B			Hep B Series	
Inactivated Poliovirus			IPV Series	
Measles, Mumps, Rubella			MMR Series	
Varicella			Varicella Series	

Range of recommended ages for all children
Range of recommended ages for catch-up immunization
Range of recommended ages for certain high-risk groups

**Recommended Adult Immunization Schedule, by Vaccine and Age Group—United States • 2011**

Vaccine ▼	Age Group ►	19–26 years	27–49 years	50–59 years	60–64 years	≥65 years
Influenza*		1 dose annually				
Tetanus, Diphtheria, Pertussis (Td/Tdap)*		Substitute 1-time dose of Tdap for Td booster; then boost with Td every 10 yrs. Td booster every 10 yrs.				
Varicella*		2 doses				
Human Papillomavirus*		3 doses (females)				
Zoster*					1 dose	
Measles, Mumps, Rubella*		1 or 2 doses		1 dose		
Pneumococcal (polysaccharide)*		1 or 2 doses				1 dose
Meningococcal*		1 or more doses				
Hepatitis A*		2 doses				
Hepatitis B*		3 doses				

\*Covered by the Vaccine Injury Compensation Program.

For all persons in this category who meet the age requirements and who lack evidence of immunity (e.g., lack documentation of vaccination or have no evidence of prior infection)

Recommended if some other risk factor is present (e.g., on the basis of medical, occupational, lifestyle, or other indications)

No recommendation

**FIGURE 3-2** Recommended immunization schedules—United States 2011. **A**, Schedule for persons aged 0 through 6 years. **B**, Schedule for persons aged 7 through 18 years. **C**, Schedule for adults. (From Centers for Disease Control and Prevention: *Immunization Schedules—United States 2011*. Accessed online at <http://cdc.gov/vaccines/recs/schedules/>.)

- (1) Killed vaccines: antigenic preparations containing killed microbes (e.g., pertussis vaccine, typhoid vaccine)
- (2) Live vaccines: antigenic preparations containing weakened (attenuated) microbes; typically such vaccines are more antigenic than killed preparations (e.g., oral [Sabin] poliomyelitis vaccine, measles vaccine)
- (3) Toxoids: antigenic preparations composed of inactivated bacterial toxins (e.g., tetanus toxoids, diphtheria toxoids)

2. Passive immunity: antibodies acquired from outside source produce short-term immunity
  - a. Natural passive immunity: passage of preformed antibodies from mother through placenta to fetus or through colostrum to neonate; during first few weeks of life newborn is immune to certain diseases to which mother has active immunity
  - b. Artificial passive immunity: injection of antisera derived from immunized animals or humans; provide immediate protection and also are of value in treatment (e.g., diphtheria antitoxin, tetanus antitoxin)

## Review of Microbiology

### *Pathology of Infection*

A Infection: invasion of body by pathogenic microorganisms (pathogens) and reaction of tissues to their presence and to toxins generated by them

1. Pathogenicity: ability of a microbe to cause disease
2. Virulence: degree of pathogenicity

#### B Classifications

1. Extent of involvement
  - a. Local infection: limited to one locality (e.g., abscess), causing pain, swelling, and erythema; may have systemic repercussions such as fever, malaise, and lymphadenopathy
  - b. Systemic infection: infectious agent is spread throughout body (e.g., typhoid fever)
2. Length of infectious process
  - a. Acute infection: one that develops rapidly, usually resulting in high fever and severe sickness; resolves in a short time
  - b. Chronic infection: one that develops slowly, with mild but longer-lasting clinical manifestation; sometimes an acute infection can become chronic
3. Etiology of infectious process
  - a. Primary infection: develops after initial exposure to pathogen, unrelated to other health problems
  - b. Secondary infection: develops when pathogens take advantage of weakened defenses resulting from a primary infection (e.g., staphylococcal pneumonia as sequela of measles)
  - c. Opportunistic infection: develops when host defenses are diminished because of disease process or therapeutic modalities (e.g., vaginal yeast infection following antibiotic therapy)

#### C Chain of infection

1. Infectious agent
2. Reservoir: source of almost all pathogens is human or animal
  - a. Persons exhibiting manifestations of disease
  - b. Carriers: persons who harbor pathogens in absence of discernible clinical disease
    - (1) Healthy carriers: those who have never had the disease in question

(2) Incubatory carriers: those in incubation phase of disease

(3) Chronic carriers: those who have recovered from disease but continue to harbor pathogens

3. Portals of exit: route by which microorganisms leave body; blood and body fluids, skin, mucous membranes, and respiratory, genitourinary, and GI tracts

4. Mode of transmission

a. Contact transmission (e.g., *Staphylococcus aureus*)

(1) Direct: contact between body surfaces

(2) Indirect: contact between susceptible host and contaminated intermediate object (e.g., sink faucets)

b. Droplet transmission: droplets from infected individual are propelled short distance by coughing, sneezing, talking, or suctioning respiratory secretions (e.g., common cold)

c. Airborne transmission: small droplet nuclei (5  $\mu\text{m}$  or smaller) or dust particles that contain pathogen remain suspended in air for extended period (e.g., *Mycobacterium tuberculosis*)

d. Common vehicle transmission: microorganisms are transmitted by contaminated food, water, or equipment (e.g., typhoid fever)

e. Vector-borne transmission: microorganisms transmitted by vectors such as mosquitoes, flies, ticks, and rats (e.g., Rocky Mountain spotted fever, Lyme disease)

5. Portals of entry: same as portals of exit except skin; intact skin prevents infection

6. Susceptible host

a. Developmental level: extremes of age

b. Inadequate nutritional status

c. Coexisting disease

d. Decreased immune responses

e. Surgical client; client in intensive care unit (ICU); presence of invasive lines

## **Types of Pathogens**

A Bacteria

1. Unicellular microbes without chlorophyll

2. Capsule: material secreted by cell, protects it from phagocytosis and increases its virulence (e.g., *Diplococcus pneumoniae*)

3. Spores: inactive resistant structures into which bacterial protoplasm can transform under adverse conditions; under favorable conditions spore germinates into active cell (e.g., *Clostridium tetani*, *Clostridium defficile*)

4. Examples of disease-producing bacteria

a. Eubacteriales: divided into five families based on shape, gram stain, and endospore formation

(1) Gram-positive cocci

(a) Diplococci: occurring predominantly in pairs (e.g., *Diplococcus pneumoniae*)

- (b) Streptococci: occurring predominantly in chains (e.g., *Streptococcus pyogenes*)
- (c) Staphylococci: occurring predominantly in grapelike bunches (e.g., *S. aureus*)
- (2) Gram-negative cocci include *Neisseria gonorrhoeae* and *Neisseria meningitidis*
- (3) Gram-negative rods include enterobacteria such as *Escherichia*, *Salmonella*, and *Shigella* species
- (4) Gram-positive rods that do not produce endospores include *Corynebacterium diphtheriae*
- (5) Gram-positive rods that produce endospores include *Bacillus anthracis*, *Clostridium botulinum*, and *Clostridium tetani*
- b. Actinomycetales (actinomycetes): moldlike microbes with elongated cells, frequently filamentous (e.g., *Mycobacterium tuberculosis*, *Mycobacterium leprae*)
- c. Spirochaetales (spirochetes): flexuous, spiral organisms (e.g., *Treponema pallidum*)
- d. Mycoplasmatales (mycoplasmas): delicate, nonmotile microbes displaying a variety of sizes and shapes

## B Viruses

1. Obligate intracellular parasite; replicates only within cell of another organism; composed of either ribonucleic acid (RNA) or deoxyribonucleic acid (DNA), not both
2. Examples of disease-producing viruses
  - a. Human immunodeficiency virus (HIV): AIDS
  - b. Hepatitis B virus (HBV): hepatitis type B
  - c. Haemophilus influenza virus: influenza
  - d. Varicella-zoster virus: chickenpox, herpes zoster, shingles

## C Fungi

1. Saprophytic organisms that live on organic material
2. Molds: fuzzy growths of interlacing filaments called hyphae; reproduce by spores
3. Yeasts: organisms that usually are single-celled; usually reproduce by budding
4. Examples of disease-producing fungi
  - a. *Candida albicans*, a yeast: moniliasis ("thrush")
  - b. *Histoplasmosis capsulatum*: histoplasmosis
  - c. *Trichophyton rubrum*: tinea pedis ("athlete's foot")

## D Control of microorganisms

1. Medical asepsis ([Table 3-1: Precautions to Prevent the Spread of Microorganisms](#))

---

**Table 3-1**

**Precautions to Prevent the Spread of Microorganisms**

---

Category	Indications	Conductions	Room	Gown	Gloves	Mask and eye	Handwashing	Precautions
STANDARD PRECAUTIONS	Used for all clients regardless of diagnosis when there is contact with: 1. Blood 2. Body fluids 3. Secretions 4. Excretions 5. Nonintact skin 6. Mucous membranes	Used for all clients, particularly those with acquired immunodeficiency syndrome (AIDS) and hepatitis type B infection	Private room indicated if personal hygiene is inadequate	Indicated if soiling with blood, body fluids, secretions, or excretions is likely (e.g., during client care activities that are associated with splashes of blood); should be impermeable to liquids	Required for touching blood, body fluids, secretions, excretions, contaminated items or surfaces, mucous membranes, and nonintact skin	Required if splashes of blood, body fluids, secretions, or excretions are likely	Required after touching blood, body fluids, secretions, excretions, or contaminated articles whether gloves were worn or not Hands must be washed when gloves are removed, before contact with another client, and before touching a noncontaminated item or surface	Discard items contaminated with blood, body fluids, secretions, or excretions in a biohazard receptacle or handle equipment and remove personal protective equipment in a manner that will prevent transfer of microorganisms. Disinfect and sterilize reusable items. Dispose of used needles and other sharp devices in properly labeled, puncture-resistant container. Never recap used needles. Use ventilation devices instead of mouth-to-mouth resuscitation.
<b>Transmission-Based Precautions*</b>								
AIRBORNE PRECAUTIONS	Prevents transmission of droplet nuclei $\leq 5 \mu\text{m}$ or dust particles that contain the pathogen; these nuclei and particles remain suspended in the air for an extended period	Tuberculosis, varicella, rubella	Negative-pressure isolation room with at least six air exchanges per hour Door must be kept closed for negative pressure to be effective	See Standard Precautions	See Standard Precautions	See Standard Precautions Use particulate respirators such as HEPA mask (high-efficiency particulate air filter respirator) when client has a known or suspected diagnosis of tuberculosis People susceptible to varicella or rubella should not enter the room	See Standard Precautions	See Standard Precautions. Confine client to room; transport only if absolutely essential; during transport have client wear a surgical mask to minimize droplet nuclei dispersal
DROPLET PRECAUTIONS	Prevents transmission of particle droplets $\geq 5 \mu\text{m}$ that are dispersed by coughing, sneezing, talking, or suctioning; these droplets travel up to 3 feet before settling on the floor or other surfaces	<i>Haemophilus influenzae</i> type b in children, meningococci meningitis, <i>Streptococcus pneumoniae</i> pneumonia, mycoplasma pneumoniae pneumonia, streptococcal pharyngitis, scarlet fever, pertussis, rubella, mumps, diphtheria	Private room; clients infected with the same organism may share a room	Don gloves when entering room	Don gloves when entering room	Don mask and eye protection equipment when entering room	See Standard Precautions	See Standard Precautions. See Airborne Precautions
CONTACT PRECAUTIONS a. Direct b. Indirect	Prevents transmission of epidemiologically important microorganisms by direct contact with client's skin or indirect contact with contaminated items or surfaces	<i>Clostridium difficile</i> enteric infection, enterohemorrhagic <i>Escherichia coli</i> , <i>Shigella</i> , hepatitis type A, herpes simplex virus, cellulitis, scabies	Private room; clients infected with the same organism may share a room	Don gown when entering room	Don gloves when entering room; change gloves after contact with substances such as feces or wound drainage that have high concentrations of microorganisms	Don mask and eye protection equipment when entering room	See Standard Precautions	See Standard Precautions. Confine client to room. Transport only if absolutely essential; during transport maintain precautions to limit transmission of microorganisms. If possible, equipment such as a stethoscope or sphygmomanometer should be used only for the infected client

\*Used in addition to standard precautions for clients with documented or suspected infection with highly transmittable or epidemiologically important pathogens.

- a. Standard precautions (e.g., hand hygiene, personal protective equipment [PPE])
- b. Transmission-based precautions (e.g., airborne, droplet, contact)

## 2. Surgical asepsis

## 3. Disinfection: removal or destruction of pathogens

## 4. Sterilization: removal or destruction of all microbes

## 5. Antiseptic: inhibits microbial growth

## 6. Heat sterilization

### a. Moist heat

(1) Steam under pressure (autoclave)

(2) Boiling objects in water; some spores resist boiling

### b. Dry heat

## 7. Radiation: all types of radiation injurious to microbes

### a. Gamma rays: sterilize food and drugs

### b. Ultraviolet light: inhibits microbial population of air in operating rooms, nurseries, and laboratories

## Related Pharmacology

## Definition of Terms

- A Bactericidal effect: destroys bacteria at low concentrations
- B Bacteriostatic effect: slows reproduction of bacteria
- C Superinfection (secondary infection): emergence of microorganism growth when natural protective flora are destroyed by an anti-infective drug
- D Bacterial resistance: natural or acquired characteristic of an organism that prevents destruction by a drug to which it was previously susceptible

## **Antibiotics**

### A Description

1. Destroy bacteria or inhibit bacterial reproduction to control infection
2. Available in oral, parenteral, and topical forms, including ophthalmic and ear drop preparations

### B Antibiotic sensitivity tests: identify antibiotics that are effective against a particular organism

### C Mechanism of action: interfere with or inhibit cell-wall synthesis of RNA or DNA of pathogen

### D Examples

1. Penicillins (broad spectrum): amoxicillin may be combined with a second drug to prevent bacterial resistance such as amoxicillin and clavulanate (Augmentin), ampicillin and sulbactam (Unasyn), piperacillin and tazobactam (Zosyn)
2. Cephalosporins (broad spectrum): cefazolin (Ancef), cephalexin (Keflex)
3. Erythromycins: clindamycin HCl (Cleocin HCl), azithromycin (Zithromax), erythromycin (Ery-Tab, Eryc)
4. Tetracyclines (broad spectrum): doxycycline (Vibramycin), tetracycline (Sumycin)
5. Aminoglycosides (broad spectrum): gentamicin, neomycin, streptomycin
6. Quinolones (broad spectrum): ciprofloxacin (Cipro) and levofloxacin (Levaquin)
7. Polymyxin group: polymyxin B
8. Glycopeptides: vancomycin (Vancocin)

### E Major side effects

1. Depressed appetite (altered taste sensitivity)
2. Nausea, vomiting (normal flora imbalance)
3. Diarrhea (normal flora imbalance)
4. Suppressed absorption of variety of nutrients including fat; protein; lactose; vitamins A, D, K, and B<sub>12</sub>; and the minerals calcium, iron, and potassium (normal flora imbalance)
5. Increased excretion of water-soluble vitamins and minerals (normal flora imbalance)
6. Superinfection (normal flora imbalance)
7. Allergic reactions, anaphylaxis (hypersensitivity)
8. Nephrotoxicity (direct kidney toxic effect)
9. Can render oral contraceptives ineffective
10. Tetracyclines
  - a. Hepatotoxicity (direct liver toxic effect)
  - b. Phototoxicity (degradation to toxic products by ultraviolet rays)

- c. Hyperuricemia (impaired kidney function)
- d. Enamel hypoplasia, dental caries, and bone defects in children younger than 8 years of age (drug binds to calcium in tissue)

#### 11. Aminoglycosides

- a. Ototoxicity (direct toxic effect to auditory [eighth cranial] nerve)
- b. Leukopenia (decreased white blood cell [WBC] synthesis)
- c. Thrombocytopenia (decreased platelet synthesis)
- d. Headache, confusion (neurotoxicity)
- e. Peripheral neuropathy (neurotoxicity)
- f. Nephrotoxicity (direct kidney toxic effect)
- g. Respiratory paralysis (neuromuscular blockade)

#### 12. Vancomycin

- a. Ototoxicity (hearing loss)
- b. Nephrotoxicity (kidney damage)

#### F Nursing care

1. Assess for history of drug allergy
2. Instruct client regarding
  - a. How to take drug (e.g., frequency, relation to meals)
  - b. Prevention of emergence of resistant strains of microorganisms (e.g., methicillin-resistant *Staphylococcus aureus* [MRSA]) by completing prescribed course of therapy
  - c. Symptoms of allergic response
  - d. Need to report side effects, including signs of superinfection (e.g., vaginal itching, diarrhea, change in cough or sputum, white plaques in mouth); suggest ingestion of yogurt or food supplements containing probiotics such as *Lactobacillus acidophilus* when dairy products cannot be tolerated; suggest nutritional consultation when drug therapy may have negative impact on client's nutritional status
  - e. Monitor for and promptly report pain, changes in urinary or hearing function
3. Shake liquid suspensions to mix thoroughly
4. Administer most preparations 1 hour before meals or 2 hours after meals for best absorption
5. Administer at equal intervals around the clock to maintain blood levels
6. Assess vital signs during course of therapy
7. Provide well-balanced diet and adequate fluids
8. Encourage use of alternate form of birth control (vs. birth control pills) during therapy
9. Tetracyclines
  - a. Explain why they are contraindicated during last half of pregnancy or by children younger than 8 years of age
  - b. Assess for potentiation if concurrently receiving oral anticoagulants
  - c. Teach to avoid direct sunlight
  - d. Advise to avoid dairy products, antacids, or iron preparations because they reduce effectiveness

10. Aminoglycosides: assess for potentiation if client is receiving neuromuscular blocking agents, general anesthetic, or parenteral magnesium; monitor renal and neurologic function
11. Vancomycin: assess peak and trough blood levels because these drugs have a narrow therapeutic range; incompatible with heparin

## **Antivirals**

### A Description

1. Prevent entrance of virus into host cells; provide prophylaxis after exposure to a person with a viral infection;
2. Available in oral, intravenous, and topical, including ophthalmic, preparations

B Examples: acyclovir (Zovirax), amantadine (Symmetrel), zanamivir (Relenza), oseltamivir (Tamiflu)

### C Major side effects

1. CNS stimulation (direct CNS effect)
2. Orthostatic hypotension (depressed cardiovascular system)
3. Dizziness (hypotension)
4. Constipation (decreased peristalsis)
5. Nephrotoxicity (direct kidney toxic effect)
6. Local irritation (direct local tissue effect)

### D Nursing care

1. Assess vital signs during course of therapy
2. Support natural defense mechanisms (e.g., encourage intake of foods rich in immune-stimulating nutrients, such as vitamins A, C, and E, and the minerals selenium and zinc)
3. Encourage intake of high-fiber foods to reduce potential for constipation
4. Monitor disease signs and symptoms and laboratory data
5. Evaluate response to medication

## **Sulfonamides**

### A Description

1. Substitute a false metabolite for para-aminobenzoic acid (PABA), required in bacterial synthesis of folic acid; treat urinary tract infections
2. Available in oral, parenteral (IM, IV), and topical, including ophthalmic, preparations

B Examples: sulfiSOXAZOLE and combination products such as sulfamethoxazole and trimethoprim (Bactrim, Septra)

1. Nausea, vomiting; decreased absorption of folacin (irritation of gastric mucosa)
2. Skin rash (hypersensitivity)
3. Malaise (decreased red blood cells [RBCs])
4. Blood dyscrasias (decreased RBCs, WBCs, platelet synthesis)
5. Crystalluria (drug precipitation in acidic urine)
6. Stomatitis (irritation of oral mucosa)

7. Headache (CNS effect)
8. Photosensitivity (hypersensitivity)
9. Allergic response, anaphylaxis (hypersensitivity)

#### C Nursing care

1. Assess for history of drug allergy
2. Promote increased fluid intake
3. Caution to avoid dehydration and direct exposure to sunlight
4. Assess vital signs during course of therapy
5. Maintain alkaline urine
6. Administer at routine intervals around clock to maintain blood levels; obtain blood specimens for peak and trough levels
7. Monitor blood work during therapy because of potential for megaloblastic anemia caused by folacin deficiency
8. Assess for potentiation of oral anticoagulant and oral hypoglycemic effects
9. Monitor for dysuria and urinary output
10. Evaluate response to medication

## ***Antifungals***

#### A Description

1. Destroy fungal cells (fungicidal) or inhibit reproduction of fungal cells (fungistatic); treat systemic and localized fungal infections
2. Available in oral, IV, topical, vaginal, and intrathecal preparations

#### B Examples

1. Amphotericin B (Fungizone), nystatin (Mycostatin, Nilstat): disrupts fungal cell membrane permeability
2. Fluconazole (Diflucan): disrupts fungal cell membrane function
3. Griseofulvin (Gris-PEG): disrupts fungal nucleic acid synthesis

#### C Major side effects

1. Nausea, vomiting (irritation to gastric mucosa)
2. Headache (neurotoxicity)
3. Blood dyscrasias (effect on bone marrow)
4. Paresthesia (neurotoxicity)

#### D Nursing care

1. Assess vital signs during course of therapy
2. Review proper method of application
3. Amphotericin B (Fungizone)
  - a. Use infusion control device for IV administration
  - b. Protect solution from light during IV infusion
  - c. Monitor blood work during therapy because of potential hypokalemia and increased urinary excretion of magnesium
  - d. Premedicate with antipyretics, corticosteroids, antihistamines, and antiemetics before IV administration
4. Griseofulvin (Gris-PEG)

- a. Assess for antagonistic effect if concurrently taking oral anticoagulants
- b. Instruct to avoid direct exposure to sunlight

## 5. Evaluate response to medication

## **Antiparasitics**

### A Description

1. Interfere with parasite metabolism and reproduction; treat parasitic diseases; helminthic (e.g., pinworm, tapeworm); protozoal (e.g., amebiasis, malaria)
2. Available in oral, parenteral (IM, subcutaneous [Sub-Q], IV), vaginal, and rectal preparations

### B Examples

1. Anthelmintics: mebendazole
2. Amebicides: chloroquine phosphate (Aralen), metronidazole (Flagyl)
3. Antimalarials: chloroquine phosphate (Aralen), hydroxychloroquine (Plaquenil), quinine (Qualaquin)
4. Antiprotozoals: pentamidine (NebuPent, Pentam 300)

### C Major side effects

1. Anthelmintics
  - a. Nausea, vomiting, diarrhea (GI irritation)
  - b. CNS disturbances (neurotoxicity)
  - c. Skin rash (hypersensitivity)
2. Amebicides
  - a. Nausea, vomiting, diarrhea (GI irritation)
  - b. Blood dyscrasias (decreased RBCs, WBCs, platelet synthesis)
  - c. Skin rash (hypersensitivity)
  - d. Headache (neurotoxicity)
  - e. Dizziness (CNS effect)
3. Antimalarials
  - a. Nausea, vomiting (gastric irritation)
  - b. Blood dyscrasias (decreased RBCs, WBCs)
  - c. Visual disturbances (impaired accommodation; retinal and corneal changes)

### D Nursing care

1. Administer with meals to decrease GI irritability
2. Assess vital signs during course of therapy
3. Monitor blood work during therapy
4. Instruct regarding hygiene practices to prevent spread of infestation
5. Ensure safety (e.g., supervise ambulation) if CNS effects are manifested
6. Antimalarials: encourage frequent visual examinations
7. Antiprotozoals: assess for bronchial constriction that may interfere with desired effect of aerosol pentamidine; assess for side effects of sudden severe hypotension
8. Instruct to report unusual bruising or bleeding
9. Evaluate response to medication

# ***General Nursing Care of Clients at Risk for Infection***

## **Assessment/Analysis**

1. History to identify factors affecting chain of infection
2. Baseline vital signs
3. Baseline WBC
4. Culture and sensitivity test results
5. Medication profile and allergies

## **Planning/Implementation**

The goal of all interventions is to prevent health care–associated infections (HAIs)

1. Decrease host susceptibility
  - a. Maintain skin and mucous membranes as first line of defense
  - b. Reinforce or maintain natural protective mechanisms (e.g., coughing, pH of secretions, resident flora)
  - c. Maintain nutrition/hydration and encourage rest and sleep to promote tissue repair and production of lymphocytes and antibodies
  - d. Educate about immunizations
2. Employ principles of asepsis
  - a. Use medical asepsis (standard precautions and transmission-based precautions): limits growth and spread of microorganisms by confining them to a specific area
  - b. Use surgical asepsis: absence of all microorganisms and spores; prevents microorganisms from entering a specific area
    - (1) Prevent contact between sterile and nonsterile items
    - (2) Keep sterile objects within 1-inch border of sterile field
    - (3) Keep sterile items between waist and shoulder level
    - (4) Keep sterile field within field of vision
    - (5) Avoid contact between sterile items and wet, porous surface; permeable surface enables contamination by capillary action
    - (6) Prevent exposure of sterile items to airborne contaminants
    - (7) Avoid reaching across sterile field
3. Limit or eliminate the microbiologic agent
  - a. Use antiseptics, disinfectants, and sterilization
  - b. Administer prescribed antimicrobial agents
4. Prevent transmission
  - a. Hand hygiene
    - (1) Before client contact; after client contact; before and after donning gloves; after contact with blood, body fluids, secretions, excretions, mucous membranes, or nonintact skin
    - (2) Use friction, soap, and warm water for at least 20 seconds to loosen and flush microorganisms
    - (3) Use alcohol-based antiseptic hand rubs; apply a palmful of agent to cupped

hands and rub all surfaces of the hands until product is dry

- b. Use standard precautions (see [Table 3-1](#)); required for all clients regardless of diagnosis or presumed infectious status
  - c. Use transmission-based precautions (see [Table 3-1](#)); required in addition to standard precautions for clients documented or suspected to be infected with highly transmissible or epidemiologically important pathogens; precautions may be combined for diseases that have multiple routes of transmission
  - d. Use needleless systems whenever possible
  - e. Activate needle safety device if present
  - f. Dispose of contaminated material
    - (1) Use impervious bags
    - (2) Do not recap needles without safety devices; use rigid container for disposal of used syringes and needles
5. Monitor vital signs: pulse rate—recognize pyrexia increases workload of heart; temperature—ensure consistency of measurement (Celsius or Fahrenheit); conversion from one temperature scale to another is accomplished by using following formulas:

$$F = (9/5 \times C) + 32$$

$$C = (F - 32) \times 5/9$$

- 6. Employ measures to decrease body temperature as prescribed (tepid bath, antipyretics, hypothermia blanket); prevent shivering, which raises basal metabolic rate (BMR) and thus temperature, pulse rate, and respirations
- 7. Ensure adequate fluid intake
- 8. Teach to avoid transmission and autoinoculation, especially meticulous hand hygiene

## Evaluation/Outcomes

- 1. Adheres to medical regimen
- 2. Establishes health practices that enhance immunity
- 3. Maintains body temperature within expected (normal) range
- 4. Maintains fluid balance
- 5. Becomes infection free
- 6. Remains free from infection

# Fluid, Electrolyte, and Acid-Base Balance

## Fluid and Electrolyte Balance

### **Fluids**

A Average adult body consists of about 40 L of water, comprising 60% of weight; may be as high as 80% in infants and as low as 40% in older adults; volume of fluid in different compartments remains relatively constant

1. Intracellular fluid (ICF) compartment accounts for two thirds of fluid
2. Extracellular fluid (ECF) compartment accounts for one third of fluid
  - a. Interstitial compartment: 10 to 12 L
  - b. Intravascular compartment: 3 L (plasma)
  - c. Small fluid compartments: 1 L (e.g., aqueous humor; serous, cerebrospinal, pleural, and synovial fluid; lymphatic channels)

B Intake must approximately equal output

1. Water enters body through digestive tract by liquids (approximately 1500 mL) and food (approximately 1000 mL); also formed by metabolism of foods (approximately 200 mL)
2. Water leaves body via kidneys (approximately 1500 mL), intestines (approximately 200 mL), and insensible losses through lungs and skin (approximately 800 mL)

C Solutions

1. Substances that dissolve in other substances form solutions
  - a. Solute: dissolved substance
  - b. Solvent: substance in which solute is dissolved
2. Measures of concentration
  - a. Osmolality: concentration of solute per kilogram (kg) of water (milliosmoles per kg)
  - b. Osmolarity: concentration of solute per liter (milliosmoles per L)
3. Concentrations of solutions
  - a. Dilute (hypotonic): small amount of solute in a relatively large amount of solvent (e.g., 0.45% NaCl)
  - b. Concentrated (hypertonic): large amount of solute in a relatively small amount of solvent (e.g., 5% dextrose in normal saline)
  - c. Isotonic solution: when osmotic pressures of two liquids are equal, flow of solvent equalizes, and the two solutions are said to be isotonic to each other (e.g., 0.9% sodium chloride, which is normal saline)

### **Major Ions (Electrolytes)**

A When an atom loses or gains an electron, it is no longer neutral but a charged particle called an ion

1. Conducts electric current when dissolved in water
  2. Concentration of electrolytes in each fluid compartment remains relatively constant ([Table 3-2: Serum Levels of Major Electrolytes](#))
-

**Table 3-2**  
**Serum Levels of Major Electrolytes**

Ion	Range of Expected Values
Calcium ( $\text{Ca}^{2+}$ )	4.5-5.5 mEq/L (ionized) 8.5-10.5 mEq/L (total)
Chloride ( $\text{Cl}^-$ )	97-107 mEq/L
Magnesium ( $\text{Mg}^{2+}$ )	1.5-2.5 mEq/L
Phosphorus ( $\text{P}^-$ )	1.8-4.6 mEq/L
Potassium ( $\text{K}^+$ )	3.5-5.0 mEq/L
Sodium ( $\text{Na}^+$ )	135-145 mEq/L

**B Cations (positively charged ions)**

**1. Sodium ( $\text{Na}^+$ )**

- a. Most abundant cation in extracellular fluid
- b. Sodium pump in most body cells pumps sodium out of intracellular fluid
- c. Action potential of nervous and muscle fibers requires sodium; sodium is basic to communication between nerves and muscles
- d. Helps regulate acid-base balance by exchanging hydrogen ions for sodium ions in kidney tubules; excess hydrogen ions (acid) are excreted
- e. Foods high in sodium include celery, processed foods, snack foods, condiments, smoked meats, and aged cheese

**2. Potassium ( $\text{K}^+$ )**

- a. Most abundant cation of intracellular fluid
- b. Potassium pump transports potassium into cells
- c. Resting polarization and repolarization of nerve and muscle fibers depend on potassium
  - (1) If potassium concentration of extracellular fluid increases (hyperkalemia), the force of cardiac contractions weakens; with extremely high concentrations the heart will not contract
  - (2) If potassium concentration of extracellular fluid decreases (hypokalemia), the resting polarization in nerve and muscle fibers increases, resulting in weakness, eventual paralysis, and a flattened T wave on electrocardiogram (ECG)
- d. Foods high in potassium include bananas, avocados, oranges, dates, apricots, cantaloupe, potatoes, and raisins

**3. Calcium ( $\text{Ca}^{2+}$ )**

- a. Forms salts with phosphates, carbonate, and fluoride in bones and teeth to harden them
- b. Required for functioning of nerves and muscles
  - (1) If calcium concentration increases (hypercalcemia), the nervous system becomes depressed and sluggish
  - (2) If calcium concentration decreases (hypocalcemia), the nervous system becomes extremely excitable, resulting in cramps and tetany
- c. Required for blood clotting, acting as cofactor in formation of prothrombin

activator and thrombin

- d. Foods high in calcium include milk, dairy products, canned fish with bones, whole grains, legumes, and leafy green vegetables

#### 4. Magnesium ( $\text{Mg}^{2+}$ )

- a. Cofactor for many enzymes involved in energy metabolism
- b. Constituent of bone
- c. Foods high in magnesium include nuts, soybeans, cocoa, seafood, whole grains, dried beans, and peas

#### C Anions (negatively charged ions)

##### 1. Chloride ( $\text{Cl}^-$ )

- a. Most abundant anion in extracellular fluid
- b. Helps balance sodium
- c. Major component of gastric secretions
- d. Dietary source of chloride is salt

##### 2. Bicarbonate ( $\text{HCO}_3^-$ )

- a. Part of bicarbonate buffer system
- b. Reacts with strong acid to form carbonic acid and basic salt; limits decrease in pH level (acidosis)

##### 3. Phosphate ( $\text{PO}_4^{2-}$ )

- a. Part of phosphate buffer system
- b. Functions in cellular energy metabolism:  $\text{phosphate} + \text{ADP} \rightarrow \text{ATP}$  (energy currency of cell)
- c. Combines with calcium ions in bone, providing hardness
- d. Involved in structure of genetic material, DNA and RNA

## ***Fluid and Electrolyte Movement***

(Figure 3-3: Mechanisms of fluid and electrolyte movement)

**FIGURE 3-3** Mechanisms of fluid and electrolyte movement. (Modified from Mahan KL, Escott-Stump S: *Krause's food & nutrition therapy*, ed 12, St. Louis, 2008, Saunders.)

**A Osmosis:** movement of fluid across semipermeable membrane from lesser concentration to greater concentration of solutes; movement of fluid across membrane continues until solution concentrations are equal

1. Osmotic pressure (oncotic pressure): forces fluid across cell membrane; exerted by large protein molecules such as albumin
2. Hypertonic solutions: when one solution has more osmotic pressure (more concentrated) than another, it draws fluid from the other
3. Hypotonic solutions: when one solution has less osmotic pressure (more dilute) than another, it forces fluid into the other
4. Albumin: important in maintenance of plasma colloid osmotic (oncotic) pressure; helps control flow of water between plasma and interstitial fluid through osmosis; during conditions such as starvation, decreased serum albumin levels result in decreased plasma colloid osmotic pressure, causing edema because less fluid is being drawn by osmosis into capillaries from interstitial spaces

**B Diffusion:** movement of molecules from area of higher concentration to area of lesser concentration

**C Filtration:** movement of fluid and solutes from area of increased hydrostatic pressure to area with less pressure; higher pressure within arterial capillary intravascular compartment moves fluid from vessels to interstitial spaces

**D Active transport:** movement of molecules across cell membrane from area of lower concentration to area of greater concentration; requires energy to reverse natural process of diffusion (e.g., sodium-potassium pump on cell membrane maintains high levels of sodium in ECF and high levels of potassium in ICF)

## ***Mechanisms That Regulate Fluid and Electrolyte Balance***

### A Thirst mechanism

1. Dryness of oral mucosa and dehydration of cells in thirst center of hypothalamus give rise to thirst sensation
2. Stretching of stomach by fluid and moistening of oral mucosa cancel thirst sensation before actual hydration of body fluids

### B Osmoreceptor system

1. Cells in hypothalamus synthesize antidiuretic hormone (ADH), which is stored in posterior pituitary before release into circulation
2. Osmoreceptors respond to dehydration by increasing ADH release; this increases water reabsorption in kidney tubules and decreases urinary output; opposite occurs with overhydration

### C Aldosterone feedback mechanism

1. Adrenal cortex secretes mineralocorticoid hormone aldosterone when extracellular fluid sodium concentrations decrease or potassium concentrations increase; produced in response to renin release by kidneys when renal perfusion is decreased
2. Aldosterone stimulates kidney tubules to reabsorb sodium; potassium reabsorption decreases as sodium reabsorption increases; occurs during stress, such as surgery
3. Mechanism helps preserve usual sodium and potassium levels in extracellular fluid
4. Secondary effects of aldosterone
  - a. Chloride conserved with sodium
  - b. Water conserved because it is reabsorbed by osmosis as tubules reabsorb sodium

### D Parathyroid regulation of calcium

1. Parathyroid glands secrete parathormone when extracellular fluid calcium levels decrease
2. Parathormone stimulates release of calcium from bone, calcium reabsorption in small intestine (vitamin D required), and calcium reabsorption in kidney tubules
3. Increased extracellular fluid calcium levels result in decreased secretion of parathormone

### E Atrial natriuretic peptide (ANP)

1. Released from atrial muscle cells in response to volume expansion and stretching of atrial wall
2. Promotes excretion of sodium and water by kidney; decreases thirst, resulting in decreased blood volume

## Acid-Base Balance

### **Basic Concepts**

#### A The pH denotes strength of hydrogen (ions) in solutions

1. Acid solutions have more hydrogen ions ( $H^+$ ) than bicarbonate or hydroxyl ions ( $OH^-$ ); low pH
2. Basic solutions have more bicarbonate or hydroxyl ions ( $OH^-$ ) than hydrogen ions ( $H^+$ ); high pH

#### B When body is in state of acid-base balance, it maintains stable hydrogen ion

concentration in extracellular (intravascular and interstitial compartments) fluid within narrow range of 7.35 to 7.45 (slightly alkaline); pH of 7 or less or pH of 7.8 or greater can result in death

1. Uncompensated acidosis exists if blood pH decreases below 7.35
2. Uncompensated alkalosis exists if blood pH increases above 7.45

C Certain body fluids have a different pH: gastric juice has pH of 1 or 2 caused by hydrochloric acid; bile and pancreatic secretions are alkaline; urine may be acidic or alkaline

## **Acids**

A Acid: compound that yields hydrogen ions when dissociated in solution

B Properties of acids

1. Act as electrolytes in water
2. React with bases to form water and a salt (neutralization)
3. In high concentration, destroy body tissues (corrosive)

C Common acids

1. Hydrochloric acid: secreted by parietal cells of stomach; transforms pepsinogen into pepsin, which is a protein-digesting enzyme of gastric juice
2. Carbonic acid
  - a. One form in which carbon dioxide ( $\text{CO}_2$ ) is transported in blood
  - b. Part of bicarbonate buffer system, which is the most important buffer system regulating pH of body fluids
3. Acetic acid: vinegar
4. Lactic acid: builds up in muscle tissue during excessive exercise when there is insufficient oxygen for metabolism of carbohydrates to glucose and water

## **Bases**

A Base: compound that combines with acid to form water and a salt (neutralization)

B Properties of bases: act as electrolyte in water; destroy body tissues (corrosive) in high concentrations

C Common bases

1. Magnesium hydroxide: water solution marketed under brand name Milk of Magnesia; antacid, mild laxative
2. Aluminum hydroxide: component of many antacids
3. Ammonium hydroxide: commonly used in household cleaners

## **Salts**

A Salt: compound formed when acid is neutralized by a base

B Properties of salts: act as electrolytes in water; crystalline in nature; "salty" taste

C Common salts

1. Sodium chloride: salt of extracellular compartment
2. Potassium chloride: salt of intracellular spaces

3. Calcium phosphate: bone and tooth formation
4. Barium sulfate: when taken internally, outlines internal structures for x-ray studies
5. Silver nitrate: antiseptic
6. Ferrous sulfate: treatment of anemia

## ***Mechanisms That Maintain Acid-Base Balance***

A Buffer mechanism: rapid first line of defense (takes seconds)

1. Buffers combine with relatively strong acids or bases to convert them to weaker acids or bases to prevent marked changes in blood pH levels
2. Often referred to as buffer pair because it consists of a weak acid and its basic salt
3. Bicarbonate buffer system
  - a. Most important buffer in body fluids because its components, base bicarbonate ( $\text{HCO}_3^-$ ) and carbonic acid ( $\text{H}_2\text{CO}_3$ ), are actively and constantly regulated by action of respiratory and urinary systems
  - b. When body is in acid-base balance, blood contains 27 mEq base bicarbonate/L and 1.35 mEq carbonic acid/L; base bicarbonate/carbonic acid ratio is 20 : 1
4. Phosphate buffer system: important in intracellular fluids, where its concentration is considerably higher
5. Protein buffer system: hemoglobin, a protein buffer, promotes movement of chloride across RBC membrane in exchange for bicarbonate ions

B Respiratory mechanism: second line of defense (takes minutes)

1.  $\text{CO}_2$  is carried in body in forms of carbonic acid and bicarbonate
2. Controls rate of carbon dioxide exhalation from lungs
  - a. When  $\text{CO}_2$  in body increases, the medulla is stimulated to increase rate and depth of respirations
  - b. When  $\text{CO}_2$  in body decreases, the rate and depth of respirations decrease
3. During body metabolism,  $\text{CO}_2$  is produced, which reacts with water to form carbonic acid, resulting in a decrease in pH (as acidity increases, pH decreases)
4. Carbonic acid breaks down into  $\text{CO}_2$  and  $\text{H}_2\text{O}$  in lungs; increased exhalation of  $\text{CO}_2$  results in increased pH (as acidity decreases, pH increases)

C Renal mechanism: third line of defense (takes hours to days)

1. Kidneys function to increase blood's sodium bicarbonate content and decrease its carbonic acid content, thereby increasing base bicarbonate-to-carbonic acid ratio and blood pH
2. Kidneys' response to high levels of hydrogen ions in body
  - a. Secrete hydrogen ions and reabsorb sodium ions
  - b. Form ammonia that combines with hydrogen ions to produce ammonium ions ( $\text{NH}_4^+$ ); ammonium ions are excreted in urine in exchange for sodium ions, which are reabsorbed
3. When there are low levels of hydrogen ions in body, kidneys retain hydrogen ions to form bicarbonate

# Acid-Base Imbalances

(Table 3-3: Primary and Compensatory Acid-Base Changes)

**Table 3-3**  
**Primary and Compensatory Acid-Base Changes**

	Primary Disturbance			Compensations		
	pH	Pco <sub>2</sub>	HCO <sub>3</sub> <sup>-</sup>	pH	Pco <sub>2</sub>	HCO <sub>3</sub> <sup>-</sup>
Metabolic acidosis	↓	N	↓	↑-N	↓	↓
Metabolic alkalosis	↑	N	↑	↓-N	↑	↑
Respiratory acidosis	↓	↑	N	↑-N	↑	↑
Respiratory alkalosis	↑	↓	N	↓-N	↓	↓

HCO<sub>3</sub><sup>-</sup>, Bicarbonate, N, normal; ↑-N, increase toward normal; ↓-N, decrease toward normal; PCO<sub>2</sub>, partial pressure of carbon dioxide; pH, measure of the acidity or alkalinity of a solution.

From McCance KL, Huether SE: *Pathophysiology: the biological basis for disease in adults and children*, ed 6, St. Louis, 2010, Mosby.

## A Respiratory acidosis

1. Carbonic acid excess; increased retention of carbon dioxide; PCO<sub>2</sub> is greater than 45 mm Hg (hypercapnia)
2. pH is below 7.35
3. Common causes
  - a. Inadequate ventilation (e.g., dyspnea)
  - b. Respiratory obstruction: mechanical (e.g., tumors) or functional (e.g., asthma)
  - c. Impaired gas exchange in alveoli (e.g., emphysema)
  - d. Neuromuscular impairment (e.g., spinal cord injury)
4. Signs of respiratory acidosis: dyspnea, irritability, disorientation, tachycardia, cyanosis, and coma
5. Compensatory mechanisms
  - a. Urinary system excretes increased hydrogen ions to compensate for respiratory system's inability to blow off CO<sub>2</sub>
  - b. Urinary system retains sodium to facilitate body's attempt to increase sodium bicarbonate

- c. Rate and depth of respirations increase; inefficient because primary dysfunction involves respiratory system
- d. With chronic hypoxia, decreased oxygen levels may stimulate breathing (otherwise, increased carbon dioxide levels stimulate breathing)

## B Metabolic acidosis

1. Base bicarbonate deficit: excess acid other than carbonic acid (respiratory acid) accumulates beyond body's ability to neutralize it; bicarbonate level is below 22 mEq/L
2. pH is below 7.35
3. Common causes
  - a. Cellular breakdown with increased ketones (e.g., starvation, terminal cancer, ketoacidosis, dieting)
  - b. Renal insufficiency (e.g., acute renal failure, chronic kidney disease)
  - c. Direct loss of bicarbonate (e.g., loss of intestinal and pancreatic secretions via diarrhea)
  - d. Lactic acid accumulation from anaerobic metabolism
4. Signs of metabolic acidosis: weakness, headache, disorientation, deep and rapid breathing (Kussmaul's respirations), fruity odor to the breath, nausea and vomiting, and coma
5. Compensatory mechanisms
  - a. Respiratory system compensates by hyperventilation in attempt to blow off  $\text{CO}_2$  and raise pH
  - b. Urinary system excretes hydrogen ions and retains bicarbonate

## C Respiratory alkalosis

1. Carbonic acid deficit: hyperventilation blows off excessive  $\text{CO}_2$ ;  $\text{PCO}_2$  is less than 35 mm Hg
2. pH is above 7.45
3. Common causes
  - a. Hyperventilation related to anxiety/panic
  - b. Excessive mechanical ventilation
4. Signs of respiratory alkalosis: rapid breathing, lightheadedness, tingling and numbness, tinnitus, loss of concentration, and unconsciousness
5. Compensatory mechanisms: urinary system retains hydrogen ions and excretes bicarbonate

## D Metabolic alkalosis

1. Base bicarbonate excess; bicarbonate level is above 26 mEq/L
2. pH is above 7.45
3. Common causes
  - a. Loss of gastric juices (e.g., vomiting, nasogastric decompression, lavage)
  - b. Excessive ingestion of alkaline drugs (e.g., sodium bicarbonate [baking soda])
  - c. Potent diuretics may precipitate hypokalemia: with hypokalemia kidneys conserve potassium and excrete hydrogen, intracellular potassium moves into interstitial compartment, and hydrogen moves into cells; as a result of these processes, plasma hydrogen level is decreased and base bicarbonate level is increased

4. Signs of metabolic alkalosis: muscle hypertonicity (tetany), tingling, tremors, shallow and slow respirations, dizziness, confusion, and coma
5. Compensatory mechanisms
  - a. Respiratory system compensates by decreasing rate and depth of breathing to retain  $\text{CO}_2$ , decreasing the pH
  - b. Urinary system excretes sodium bicarbonate

## General Nursing Care of Clients with Fluid and Electrolyte Problems

### Assessment/Analysis

1. History to identify etiology of fluid and electrolyte imbalances ([Table 3-4: Fluid/Electrolyte Imbalances: Etiology, Assessments, and Treatments](#))

**Table 3-4**

**Fluid/Electrolyte Imbalances: Etiology, Assessments, and Treatments**

Fluid/Electrolyte Imbalance	Etiology	Signs and Symptoms	Treatment
Extracellular fluid deficit	Decreased fluid intake	Increased thirst	Administration of hypotonic or isotonic fluids
	Prolonged fever	Dry skin and mucous membranes	Vasopressin injection
	Vomiting	Increased temperature	Transfusions if due to blood loss
	Excessive use of diuretics	Flushed skin	
	Diabetes insipidus	Rapid, thready pulse	
	Hemorrhage (acute)	Decreased BP	
Extracellular fluid excess		Increased Hct, $\text{Na}^+$ , BUN, and specific gravity	
	Heart failure	Weight gain	Administration of diuretics
	Liver disease	Crackles	Fluid restriction
	Malnutrition (decreased plasma protein)	Edema	Administration of colloids if kidney function normal
	Renal disease	Ascites	Dialysis if impaired kidney function
	Excessive parenteral fluids	Confusion	
Hypokalemia $\text{K}^+ < 3.5 \text{ mEq/L}$		Weakness	
		Increased BP	
		Bounding pulse	
		Distended neck veins	
		Decreased Hct	
	Diarrhea	Loss of muscle tone	Parenteral/oral administration of potassium supplement
	Vomiting	Cardiac dysrhythmias	Increased dietary intake of potassium
	Diabetic acidosis	Abdominal distention	
	Diuretics (loop or thiazide)	Vomiting	
	Inadequate intake	Decreased serum $\text{K}^+$	
	Excess aldosterone		
	Advanced kidney disease	Cardiac irregularities	Administration of potassium-free fluids
Hyperkalemia $\text{K}^+ > 5.0 \text{ mEq/L}$	Severe burns or tissue trauma	Weakness	Dialysis
	Excessive doses of potassium	Diarrhea	Potassium-removing resin
	Decreased aldosterone	Nausea	Diuretics
	$\text{K}^+$ -sparing diuretics	Irritability	Glucose and insulin
		Increased serum $\text{K}^+$	

Hyponatremia Na <sup>+</sup> <135 mEq/L	Diuretics Electrolyte-free IV fluids Diarrhea GI suction Excessive perspiration followed by increased water intake	Abdominal cramps Seizures Oliguria Decreased serum Na <sup>+</sup> and specific gravity	Administration of IV solutions containing NaCl Administration of NaCl tablets Fluid restriction
Hypertremia Na <sup>+</sup> >145 mEq/L	Diabetes insipidus Excess NaCl IV fluid intake Watery diarrhea Water deprivation Insensible fluid loss	Dry, sticky mucous membranes Oliguria Firm tissue turgor Dry tongue Increased serum Na <sup>+</sup> and specific gravity Weakness	Low-Na <sup>+</sup> diet Increased Na <sup>+</sup> -free fluid intake
Hypocalcemia Ca <sup>2+</sup> <4.5 mg/dL (ionized) Ca <sup>2+</sup> <8.5 mg/dL (total)	Removal of parathyroid glands Administration of electrolyte-free solutions Alkalosis Acute pancreatitis	Tingling of extremities Tetany Cramps Seizures Hyperactive deep tendon reflexes Positive Chvostek's and Trousseau's signs	Oral or parenteral calcium replacement
Hypercalcemia Ca <sup>2+</sup> >5.5 mg/dL (ionized) Ca <sup>2+</sup> >10.5 mg/dL (total)	Hyperparathyroidism Prolonged immobility Bone cancer Excessive intake of Ca <sup>2+</sup> or vitamin D	Flank pain (renal calculi) Deep bone pain Relaxed muscles Decreased deep tendon reflexes Constipation	Correction of primary problem Increased fluid intake Weight-bearing exercises

BP, blood pressure; BUN, blood urea nitrogen; Hct, hematocrit.

- Vital signs
- Skin turgor, hydration, and temperature
- Breath sounds
- Daily weights
- I&O
- Abdominal girth measurements or extremity circumference as necessary
- Changes in behavior, energy level, and level of consciousness
- Laboratory tests (e.g., urine specific gravity; serum pH and arterial blood gases; serum electrolytes; hematocrit; blood urea nitrogen; creatinine clearance)

## Planning/Implementation

- Manage and monitor fluid and electrolyte balance
  - Fluids may be encouraged to correct deficit (usually 3000 mL/day); may be restricted to prevent excess
  - Nutritional intake can be increased or restricted to correct electrolyte disturbances (e.g., sodium, potassium, calcium)
  - Monitor intake and output (I&O); 30 mL = 1 ounce
  - Weigh daily; 1 L weighs 1 kg, or 2.2 lb
- Administer intravenous therapy
  - Fluids
    - Dextrose in water
      - Provides fluid and limited calories (1 L of 5% dextrose = 170 calories); may result in negative nitrogen balance if client is not eating
      - Corrects dehydration, ketosis, and hypernatremia
    - Dextrose in sodium chloride (NaCl): corrects fluid loss from excessive perspiration or vomiting; prevents alkalosis

(3) NaCl: manages alkalosis, fluid loss, and adrenal cortical insufficiency

(4) Ringer's solution

(a) Contains sodium, chloride, potassium, and calcium

(b) Corrects dehydration from vomiting, diarrhea, or inadequate intake

(5) Lactated Ringer's solution

(a) Contains sodium, chloride, potassium, calcium, and lactate

(b) Lactate is metabolized by liver and forms bicarbonate

(c) Corrects extracellular fluid shifts and moderates metabolic acidosis

(6) Plasma expanders

(a) Increase blood volume in clients with burns or traumatic injuries

(b) Examples: albumin, plasma, plasma protein fraction (Plasmanate), dextran (Gentran 40), and hetastarch (Hespan)

(c) Should be administered slowly

b. Regulation of IV flow rates

(1) Manual regulation of gravity flow by drops with clamp; drops per mL (e.g., 10, 15, 60) depends on tubing selected (drop factor); potential energy of fluid in IV bag is converted to kinetic energy when it flows through tubing

(2) Calculate IV drop rate per minute using the formula:

$$\text{Drops per min} = \frac{\text{total mL to be infused} \times \text{drop factor}}{\text{total time in minutes (hours} \times 60 \text{ minutes)}}$$

(3) Infusion pump or controller device (ICD): volume control usually is in milliliters per hour (follow manufacturer's instructions when setting desired rate of flow)

c. Monitor client for complications

(1) Infiltration

(a) Catheter is displaced, allowing fluid to leak into tissues

(b) Insertion site is pale, cool, and edematous; flow rate decreases

(c) IV must be removed and restarted in new site

(2) Phlebitis

(a) Vein is irritated by catheter or medications

(b) Insertion site is red, painful, and warm; flow rate is decreased

(c) IV must be removed and restarted in new site; warm compresses are ordered to be applied to inflammation

(3) Circulatory overload

(a) Flow rate exceeds cardiovascular system's capability to adjust to increased fluid volume

(b) Client exhibits dyspnea, crackles, distended neck veins, and increased BP

(c) Rate is decreased to keep vein open; health care provider is notified and diuretics administered as prescribed

(4) Infection

(a) Change solution bag every 24 hours because risk for contamination is

increased after this time; frequency of tubing and site change is based on agency policy (usually every 3 days)

(b) Client exhibits signs of inflammation at insertion site, lymphatic streaking, and -fever

3. Administer pharmacologic agents

- a. Diuretics (e.g., thiazide, potassium-sparing, loop, or osmotic diuretics) (see [Ch 6, Related Pharmacology, Diuretics](#))
  - b. Replace electrolytes (e.g., sodium chloride, potassium chloride, calcium gluconate)
  - c. Reduce serum potassium ( $K^+$ ) level (e.g., sodium polystyrene sulfonate [Kayexalate]; insulin to carry  $K^+$  into cells)
4. Provide care (e.g., skin care, safe environment) based on specific clinical findings

## Evaluation/Outcomes

1. Maintains fluid balance
2. Maintains serum electrolyte levels within expected range
3. Maintains vital signs within expected range

# Perioperative Care

## Classification of Surgery

A Classified as elective, diagnostic, urgent (emergency), ablative, palliative, or curative  
B Surgical approaches have advanced to minimize tissue trauma, duration of anesthesia, and postoperative recovery time, and to improve client outcomes

1. Laparoscopic surgery: uses small incisions and fiberoptic instruments that formerly required larger surgical incisions; depending on site, may require insufflation of cavity with carbon dioxide to enhance visualization of structures, particularly for abdominal surgery; after abdominal insufflation with carbon dioxide, client may experience right shoulder or scapular pain postoperatively because of migration of the carbon dioxide
2. Robotic surgery: uses laparoscopic cameras that provide three-dimensional view and robotic equipment that is manipulated by health care provider at a surgical console; robotics improves precision and control

C Ambulatory surgery

1. Performed in hospital or private surgical facility
2. Diagnostic workup is performed by hospital, health care provider, or clinic before day of surgery
3. Discharged same day as surgery; if complications occur, client is admitted to hospital

## Related Pharmacology

### **General Anesthetics**

A Description

1. Used in combination to produce varying levels of loss of consciousness, amnesia, anesthesia, analgesia, and/or skeletal muscle relaxation
2. Depress CNS through progressive sequence (four stages)
3. Neuromuscular blocking agents (depolarizing and nondepolarizing muscle relaxants): inhibit transmission of nerve impulses by binding with cholinergic receptor sites, antagonizing action of acetylcholine
4. Available in parenteral (IM, IV) and inhalation preparations
  - a. Ultra-short-acting IV barbiturates are used in induction of anesthesia because they quickly penetrate blood-brain barrier
  - b. IV and IM nonbarbiturates produce special type of anesthesia in which client appears to be awake but dissociated from environment, resulting in amnesia for surgical experience

B Examples

1. Inhalation anesthetics: halothane (Fluothane); nitrous oxide
2. IV barbiturates: high lipoid affinity promptly affects cerebral tissue
  - a. Methohexital (Brevital)
  - b. Thiopental (Pentothal)
3. IV and IM nonbarbiturates: induce cataleptic state and produce amnesia for procedure

- a. Midazolam (Versed)
- b. Combination product: fentanyl (Sublimaze) and droperidol (Innovar)
- 4. Conscious sedation: IV or nasal routes of sedation to depress consciousness but maintains airway and ventilations (e.g., midazolam [Versed], ketamine [Ketalar], and fentanyl [Sublimaze])
- 5. Neuromuscular blocking agents (depolarizing and nondepolarizing muscle relaxants)
  - a. Pancuronium (Pavulon)
  - b. Succinylcholine (Anectine)

## C Major side effects

- 1. Inhalation anesthetics
  - a. Excitement and restlessness during induction (initial CNS stimulation)
  - b. Nausea and vomiting (stimulation of chemoreceptor trigger zone in medullary vomiting center)
  - c. Respiratory distress (depression of medullary respiratory center)
  - d. Affinity for adipose tissue, resulting in prolonged effects
  - e. Malignant hyperthermia, rare life-threatening condition, associated with muscle rigidity, pyrexia, and tachycardia; susceptibility linked to autosomal dominant disorder)
- 2. IV barbiturates
  - a. Respiratory depression (depression of medullary respiratory center)
  - b. Hypotension and tachycardia (depression of cardiovascular system)
  - c. Laryngospasm (depression of laryngeal reflex)
- 3. IV and IM nonbarbiturates
  - a. Respiratory failure (depression of medullary respiratory center)
  - b. Changes in BP: hypertension; hypotension (alterations in cardiovascular system)
  - c. Rigidity (increased muscle tone)
  - d. Psychic disturbances (emergence reaction in recovery period)
- 4. Depolarizing muscle relaxants
  - a. Hypotension (increased vagal stimulation; increased release of histamine; ganglionic blockade)
  - b. Respiratory depression (neuromuscular blockade)
  - c. Dysrhythmias (increased vagal stimulation)

## D Nursing care

- 1. Assess for allergies and medical problems that could alter a response to anesthetic agents
- 2. Have oxygen and emergency resuscitative equipment available
- 3. Assess vital signs before, during, and after anesthetic administration
- 4. Maintain calm environment during induction of anesthesia
- 5. Use safety precautions with flammable agents
- 6. Provide for safety because of decreased sensory awareness and reflexes
- 7. Administer opioids judiciously in initial postanesthetic period because of potential interaction with anesthetic agent
- 8. Provide care for client receiving depolarizing muscle relaxant

- a. Administer sedation; have emergency resuscitative equipment available
- b. Assess vital signs before, during, and after administration
- c. Administer under direct medical supervision
- d. Maintain airway and oxygenation

9. Maintain side-lying position to prevent aspiration after general anesthesia

10. Restrict oral intake after general anesthesia until ability to swallow has returned

## **Local Anesthetics**

### **A Description**

1. Block nerve impulse conduction in sensory, motor, and autonomic nerve cells by decreasing nerve membrane permeability to sodium ion influx; used for pain control without loss of consciousness
2. Used for obstetric, dental, and minor surgical procedures; used for postoperative pain control when administered subcutaneously on a continuous basis (e.g., on Q Pain Buster pump)
3. Available in topical, spinal, regional, and nerve block preparations; epinephrine may be added to enhance duration of local anesthetic effect and to decrease regional bleeding

### **B Examples**

1. Topical: local infiltration of tissue (e.g., benzocaine [Solarcaine], lidocaine [Xylocaine]); nerve block (e.g., tetracaine [Pontocaine], also used for spinal anesthesia)
2. Spinal: injected into subarachnoid space (e.g., lidocaine [Xylocaine], procaine [Novocain]); also used for nerve block
3. Epidural: injected into epidural space of spinal column (e.g., bupivacaine [Marcaine], lidocaine [Xylocaine])
4. Nerve block: injected at perineural site distant from desired anesthesia site (e.g., bupivacaine [Marcaine], chloroprocaine [Nesacaine], mepivacaine [Carbocaine], ropivacaine [Naropin])

### **C Major side effects**

1. Allergic reactions; anaphylaxis (hypersensitivity)
2. Respiratory arrest (depression of medullary respiratory center)
3. Dysrhythmias, cardiac arrest (depression of cardiovascular system)
4. Seizures (depression of CNS)
5. Hypotension (depression of cardiovascular system)

### **D Nursing care**

1. Assess for allergies and medical problems that could alter response to anesthetic agent
2. Have oxygen and emergency resuscitative equipment available
3. Assess vital signs before, during, and after anesthetic administration
4. Protect anesthetized body parts from mechanical and/or thermal injury
5. If spinal anesthetic is administered, keep flat for specified period of time (usually 6 to 12 hours) to prevent severe headache; avoid pillows; monitor for hypotension; monitor return of motor and sensory function to lower extremities
6. If local anesthetic is administered along a nerve via a pump for pain control, teach how

to use pump; monitor for local anesthetic toxicity

## ***Sedatives/Hypnotics***

### A Description

1. Used for short-term treatment of clients with situational anxiety and insomnia
2. Depress CNS; produce sedation in small dosages and sleep in larger dosages
3. Available in oral, parenteral (IV, IM), and rectal preparations

### B Examples

1. Benzodiazepines: act on many levels of CNS to produce short-term sedation, anxiolysis, and amnesia; used for conscious sedation during diagnostic procedures (e.g., midazolam [Versed], diazepam [Valium], temazepam [Restoril])
2. Barbiturates: depress CNS starting with diencephalon (e.g., thiopental [Pentothal])
3. Nonbarbiturates: depress CNS and relax skeletal muscles (e.g., chloral hydrate [Noctec], hydrOXYzine [Vistaril], propofol [Diprivan])

### C Major side effects

1. Drowsiness (depression of CNS)
2. Hypotension (depression of cardiovascular system)
3. Dizziness (hypotension)
4. Gastrointestinal irritation (local effect)
5. Skin rash (hypersensitivity)
6. Blood disorders (hematologic alterations)
7. Drug dependence
8. Barbiturates
  - a. "Hangover" (persistence of low barbiturate concentration in body caused by decreased metabolism)
  - b. Photosensitivity (hypersensitivity)
  - c. Excitement in children and older adults (paradoxical reaction)

### D Nursing care

1. Avoid administration with other CNS depressants
2. Use safety precautions
3. Administer controlled substances according to policy
4. Caution to avoid engaging in hazardous activity; avoid concurrent ingestion of alcohol

## ***General Nursing Care of Clients during the Preoperative and Intraoperative Periods***

## **Assessment/Analysis**

1. History of current health problems and factors that may influence surgery, anesthesia, or recovery
2. Physical assessment to identify potential health problems
3. Understanding of disease and treatment plan
4. Emotional state and coping skills

5. Comprehensive list of medications, including herbal and vitamin supplements and over-the-counter (OTC) agents for medication reconciliation

## Planning/Implementation

1. Witness signing of consent form by client; review information included in health care provider's explanation of the surgery; inform health care provider if client appears not to understand
2. Ensure identification band is in place and accurate; ensure client verification at each step of preoperative, intraoperative, and postoperative phases of surgery
3. Follow agency policy to ensure that operative site is identified and marked; explain that client will be asked to verify self, procedure, and site numerous times as a precaution
4. Explain all procedures and give reasons for them
5. Explain what to expect in operating room, postanesthesia and/or ICUs, including anticipated equipment such as PCA pump
6. Allow client and family time to ask questions about procedures and surgery
7. Allow and encourage ventilation of feelings about diagnosis and surgery
8. Provide spiritual counselor if desired
9. Provide perioperative teaching about promoting respirations postoperatively (e.g., diaphragmatic breathing, coughing, incentive spirometry, splinting, and turning)
10. Teach exercises that promote circulation after surgery, such as leg exercises (e.g., dorsiflexion, plantar flexion, eversion, inversion), ambulation routines, isometric exercises
11. Advise to expect some discomfort after surgery, and teach importance of requesting medication for pain or using patient-controlled analgesia (PCA) before pain becomes severe
12. Verify that history, physical examination results, recent laboratory tests, and chest x-ray report are entered on client's record
13. Inform all members of health team of client's allergies and other health problems, and prominently mark clinical record
14. Implement preoperative preparation orders (e.g., enemas, douches, intestinal antibiotics for bowel surgery, antibiotics)
15. Explain that dietary restrictions are implemented to prevent aspiration when receiving general anesthesia (e.g., refraining from eating a heavy meal 8 hours before surgery, a light breakfast up to 6 hours before surgery, and clear liquids 2 to 3 hours before surgery); check with anesthesiologist for specific instructions because some health care providers may require NPO after midnight
16. Provide care on day of surgery
  - a. Assess vital signs and general physical status; record and report any deviations to health care provider
  - b. Assess emotional status; notify health care provider if client expresses sense of doom
  - c. Complete preoperative checklist (e.g., consent form, preoperative tests, and identification and allergy bands)

- d. Provide hygiene and have client void
  - e. Remove any prosthetics such as dentures, contact lenses, and wigs
  - f. Apply sequential compression devices as ordered
  - g. Arrange for insertion of any tubes as ordered (e.g., nasogastric tube, indwelling urinary catheter, intravenous line)
  - h. Administer prescribed preoperative medications (e.g., prophylactic antibiotic within 1 hour before surgery, antianxiety agents, sedatives, opioid analgesics, anticholinergics)
  - i. Ensure safety after administering medications
17. Provide care in operative suite
- a. Assume role of client advocate during intraoperative phase; identify client and operative site with members of operative team
  - b. Complete preoperative checklist
  - c. Perform skin preparation as ordered (e.g., shaving, scrubs used for orthopedic surgery)
  - d. Apply monitoring devices as needed
  - e. Insert urinary retention catheter if ordered
  - f. Allay anxiety (ambulatory surgical clients remain aware during most of stay in operating room because local anesthetics frequently are used)
  - g. Position and drape for surgery
  - h. Support during anesthesia introduction
    - (1) Stage 1: becomes drowsy and loses consciousness
    - (2) Stage 2 (stage of excitement): muscles become tense, breathing may be irregular
    - (3) Stage 3: vital signs and reflexes are depressed; operation begins
    - (4) Stage 4: respiratory depression is complete

## **Evaluation/Outcomes**

- 1. Verbalizes fears concerning operative process
- 2. Demonstrates understanding of preoperative teaching
- 3. Verbalizes understanding of postoperative interventions
- 4. Remains free from injury

## **General Nursing Care of Clients during the Postoperative Period**

### **Assessment/Analysis**

- 1. Patency of airway and oxygenation status
- 2. Baseline vital signs, breath sounds
- 3. Level of consciousness
- 4. Tubes for patency and placement, and drainage for characteristics
- 5. Extent of urinary output
- 6. Clinical manifestations of hemorrhage
- 7. Extent of wound healing after initial postoperative period
- 8. Presence of complications ([Figure 3-4](#): Potential problems in the postoperative period)

**FIGURE 3-4** Potential problems in the postoperative period. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.)

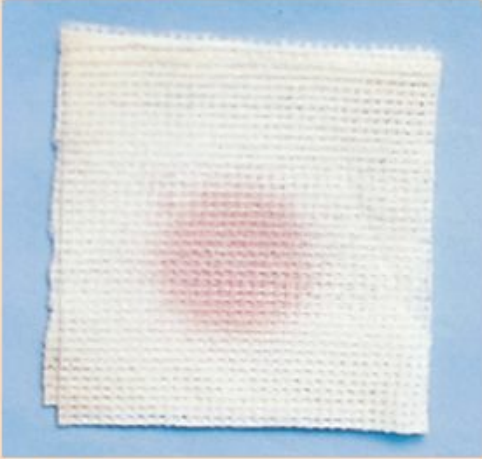

## Planning/Implementation

1. Provide immediate care in postanesthesia care unit (PACU)
  - a. Maintain airway and respirations (anesthesia depresses respiratory function)
    - (1) Position on side with neck slightly extended to prevent aspiration and accumulation of mucous secretions
    - (2) Suction artificial airway and oral cavity as needed to remove secretions
    - (3) Administer oxygen as ordered or needed; monitor oxygen saturation
    - (4) Keep artificial airway in place until gag reflex returns; suction airway before extubation to clear secretions as needed; assess for respiratory distress after extubation (e.g., restlessness, confusion, dyspnea, stridor, decreased oxygen saturation, inability to expectorate)
    - (5) Monitor rate, rhythm, symmetry of chest movement, breath sounds, pulse oximeter, behavior, and color of mucous membranes
    - (6) Encourage coughing and deep breathing as soon as able to participate
  - b. Promote circulation (anesthesia and immobilization during surgery may result in circulatory compromise)
    - (1) Monitor heart rate and rhythm, and blood pressure at regular intervals (e.g., approximately every 5 minutes initially and then every 15 minutes)
    - (2) Monitor peripheral circulation by identifying color, temperature, presence of pulses, motor and sensory function, and capillary refill (may not be helpful if client has chronically poor circulation)
    - (3) Monitor for signs and symptoms of hemorrhage by assessing blood pressure for hypotension, checking pulse rate for tachycardia, and observing and measuring wound drainage; frequent swallowing or expectoration of blood with surgery of respiratory tract; report signs of hemorrhage immediately

- (4) Institute venous thromboembolism prophylaxis (e.g., prescribed anticoagulants, sequential compression devices, ankle pumping exercises, and early ambulation if permitted)
- c. Monitor neurologic status by identifying level of consciousness, pupillary blink and gag reflexes, motor and sensory status of extremities; provide for related needs (medications and anesthetic agents depress CNS)
- d. Wound care
- (1) Identify location and size of wound and color, odor, amount, and consistency of drainage; check dependent areas because drainage flows by gravity ([Table 3-5: Types of Wound Drainage](#))

**Table 3-5**

**Types of Wound Drainage**

Type	Appearance	Type	Appearance
Serous	Clear, watery plasma	Serosanguineous	Pale, red, watery: mixture of clear and red fluid
			
Purulent	Thick, yellow, green, tan, or brown	Sanguineous	Bright red: indicates active bleeding
			

From Potter PA, Perry AG: *Fundamentals of nursing*, ed 7, St. Louis, 2009, Mosby.

- (2) Circle drainage on dressing and mark time and date to allow for objective assessment
- (3) Reinforce postoperative dressings because health care providers generally perform first dressing change
- (4) Protect integrity of surgical incision (e.g., instruct how to sit up in bed, how to splint incision, and how to maintain a clean, dry dressing)

- (5) Protect client if wound edges separate (dehiscence) or abdominal organs extrude through incision (evisceration); place in supine position, cover site with sterile towel moistened with normal saline, notify health care provider

e. Care for drains and tubes

- (1) Maintain patency of tubing (e.g., gravity, negative pressure, instillation or irrigation as indicated)
- (2) Attach tubing to appropriate collection containers; maintain negative pressure in portable wound drainage systems (e.g., empty when half full and compress before closing port; maintain surgical asepsis)
- (3) Monitor drainage for amount and color

f. Meet fluid and electrolyte needs

- (1) Maintain IV therapy as ordered
- (2) Record I&O
- (3) Monitor for electrolyte imbalances

g. Meet comfort and emotional needs

- (1) Assess presence and characteristics of pain (e.g., location, intensity, duration, precipitating factors, and effectiveness of pain management)
- (2) Medicate as prescribed to reduce pain and increase postoperative activities such as deep breathing, coughing, and mobility
- (3) Call by name; reorient to time, place, and situation
- (4) Reinforce teaching about how to use PCA pump
- (5) Answer questions as honestly and simply as possible; repeat as needed

2. Provide ongoing postoperative care

a. Protect from injury

b. Use pharmacologic and nonpharmacologic measures to manage pain

c. Turn frequently; encourage deep breathing and coughing and use of incentive spirometer to prevent development of atelectasis or hypostatic pneumonia; auscultate for diminished breath sounds in lower lobes, which may indicate atelectasis

d. Perform or encourage range of motion and isometric exercises and early ambulation to prevent phlebitis, paralytic ileus, and venous stasis; notify health care provider of complications

e. Maintain patency of tubing (e.g., urinary catheter, gastric tube, T-tube, chest tubes, incisional drains) to promote drainage, maintain decompression, and reduce pressure on suture line

f. Use surgical aseptic technique when changing dressings, or as necessary when irrigating tubing or emptying portable wound drainage systems, to prevent infection

g. Monitor I&O for signs of dehydration and electrolyte imbalance

h. Encourage to void; provide privacy; assess for urinary retention (client must void 8 to 12 hours after surgery or a catheter may be inserted)

i. Prevent constipation by encouraging fluid, fiber, and exercise; observe for abdominal distention; rectal tube (usually for 30 minutes) or Harris flush may be ordered to relieve flatus

j. Regulate IV therapy to prevent overload or circulatory collapse; maintain hydration

- k. Encourage to support and splint incisional site when coughing, moving, or turning, to prevent tension on suture line
- l. Position as required by type of surgery to maintain alignment and prevent accumulation of fluid or blockage of drainage tubes
- m. Support emotionally; assist to cope with changes in body image
- n. Provide for nutritional needs
  - (1) Maintain IV therapy to ensure adequate water and electrolytes
  - (2) Monitor parenteral nutrition (total parenteral nutrition [TPN] and peripheral parenteral nutrition [PPN]) (see [Ch 8](#), Related Procedures, Parenteral Replacement Therapy)
  - (3) Gradually increase oral intake as permitted (see [Ch 8](#), Overview, Review of Diets)
  - (4) Provide for special nutritional needs
    - (a) Protein: increased need caused by protein losses and anabolism of recovery and tissue healing; approximate requirement for adult is 1.2 to 2 g/kg/day
    - (b) Calories: adequate amount to supply energy and spare protein for tissue building
    - (c) Vitamins and minerals: need will increase after surgery; zinc increases strength of healing wound (4 to 6 mg/day recommended); vitamin C required for collagen formation (500 to 1000 mg/day recommended)
- o. Ambulatory surgical client: when stable, has retained foods, and has voided, reinforce postoperative teaching and discharge planning with client and family; evaluate understanding of teaching
- p. Provide discharge instructions and document; include wound care, hydration, nutrition, prevention/management of constipation, exercise, pain management, coughing and deep breathing, need for follow-up care

## Evaluation/Outcomes

- 1. Avoids respiratory complications
- 2. Remains free of clinical indicators of infection
- 3. Reports relief of pain
- 4. Maintains integrity of surgical incision
- 5. Maintains fluid balance
- 6. Returns to expected volume of urinary output
- 7. Returns to expected pattern of bowel function
- 8. Demonstrates ability to care for self
- 9. Copes with changes resulting from surgery

# Neoplastic Disorders

## Classification of Neoplasms

### A Benign neoplasia

1. Cells adhere to one another, and growth remains circumscribed
2. Generally not life-threatening unless they occur in restricted area (e.g., skull)
3. Classified according to tissue involved (e.g., glandular tissue [adenoma], bone [osteoma], nerve cells [neuroma], fibrous tissue [fibroma])

### B Malignant neoplasia

1. Cells are undifferentiated (anaplasia) and rapidly dividing
2. Cells infiltrate surrounding tissue
3. May spread (metastasize) by direct extension, lymphatic permeation and embolization; diffusion of cancer cells can occur by mechanical means and produce secondary lesions
4. Membranes of malignant cells contain specific proteins (tumor-specific antigens)
5. Tumors are classified according to tissue involved (e.g., glandular epithelial tissue [adenocarcinoma], epithelial surface tissue [carcinoma], connective tissue [sarcoma], melanocytes [melanoma])
6. Tumors are often classified by universal system of staging classification, TNM system
  - a. T designates primary tumor
  - b. N designates lymph node involvement
  - c. M designates metastasis
  - d. A number (0 to 4) after any of above letters designates degree of involvement
  - e. TIS designates carcinoma in situ or one that has not infiltrated

## Related Pharmacology

### **Basic Concepts**

A Destroy malignant cells by interfering with reproduction of cancer cell

B Act at specific points in cycle of cell division (cell-cycle specific) or at any phase in cycle of cell division (cell-cycle nonspecific)

C Affect any rapidly dividing cell within body, thus having potential for toxicity development in healthy, functional tissue (e.g., bone marrow, hair follicles, GI mucosa); combination therapy often is used to reduce possibility of toxicity and maximize therapeutic effect (e.g., CHOP: cyclophosphamide (Cytosan), DOXOrubicin, vinCRISTine, prednisone)

D Available in oral, parenteral (IM, Sub-Q, IV), intra-arterial, intrathecal, and topical preparations

### **Alkylating Agents**

A Cell-cycle nonspecific; attack DNA of rapidly dividing cells

B Examples

1. Nitrosourea: carmustine (BiCNU)

2. Nitrogen mustard: chlorambucil (Leukeran), cyclophosphamide (Cytoxan)
3. Inorganic heavy metal: cisplatin (Platinol-AQ), carboplatin (Paraplatin)

## ***Vinca Alkaloids***

A Cell-cycle specific; work during “M” phase; interfere with mitosis

B Example: vincristine

## ***Antibiotics***

A Cell-cycle nonspecific; inhibit DNA and RNA synthesis of rapidly dividing tissue

B Examples: mitomycin (Mutamycin), DOXOrubicin

## ***Antimetabolites***

A Cell-cycle specific; inhibit protein synthesis in rapidly dividing cells during “S” phase

B Examples: fluorouracil or 5-FU (Carac, Efudex, Fluoroplex), hydroxyurea (Hydrea), methotrexate (Trexall)

## ***Hormones***

A Tissue-specific; inhibit RNA and protein synthesis in tissues that are dependent on opposite (sex) hormone for development

B Examples: androgens, estrogens (estramustine [Emcyt]), progestins, steroids (prednisone), hormone antagonists (mitotane [Lysodren]), cortisol antagonist, estrogen antagonist (anastrozole [Arimidex], tamoxifen citrate), and luteinizing hormone–releasing hormone agonist (leuprolide [Lupron])

## ***Monoclonal Antibodies***

A Exogenous antibodies produced in laboratory by combining specific cancer cells with antibody-producing B cells; derived from different sources: mouse (murine), combination of mouse and human sources (chimeric), or humanized

B Examples: rituximab (Rituxan), for non-Hodgkin’s lymphoma; trastuzumab (Herceptin) for certain types of breast cancer; gemtuzumab ozogamicin (Mylotarg) for leukemia; alemtuzumab (Campath) for B-cell chronic lymphocytic leukemia; ibritumomab tiuxetan (Zevalin) for B-cell non-Hodgkin’s lymphoma; cetuximab (Erbix) for advanced colorectal cancer

## ***Other Immune Agents***

A Introduction of noncancerous antigens or other agents into body to stimulate production of lymphocytes and antibodies

B Examples

1. Bacille Calmette-Guérin (BCG) vaccine (TICE BCG): provides active immunity
2. Interferon alfa-2a (Roferon-A), interferon alfa-2b (Intron A): suppresses cell proliferation

3. Filgrastim (Neupogen): granulocyte colony–stimulating factor

## **Miscellaneous Agents**

A Leucovorin calcium: reduced form of folic acid; acts as antidote to folic acid antagonists

B Paclitaxel (Taxol): inhibits reorganization of microtubule network that is needed for interphase and mitotic cellular functions; causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

## **Major Side Effects**

A Anorexia, nausea, vomiting, stomatitis (irritation of GI tract; quick uptake by rapidly dividing alimentary tract tissue)

B Diarrhea (irritation of GI tract; quick uptake by rapidly dividing alimentary tract tissue)

C Bone marrow depression (quick uptake by rapidly dividing myeloid tissue)

D Blood dyscrasias (neutropenia, anemia, and thrombocytopenia) resulting from bone marrow depression

E Alopecia (rapid uptake by rapidly dividing hair follicle cells)

F CNS disturbances (neurotoxicity)

G Hepatic disturbances (hepatotoxicity)

H Tumor lysis syndrome: release of large quantities of breakdown products, causing hyperkalemia, hyperuricemia, hyperphosphatemia, and acute renal failure

I Acute renal failure (direct kidney toxic effect)

J Cardiomyopathy (irreversible myocardial toxicity, congestive heart failure [CHF], ventricular dysrhythmias)

K Metabolic abnormalities (hypercalcemia, hyperuricemia)

L Allergic reactions, anaphylaxis with BCG vaccine

## **Radiation**

### **Purpose**

A Diagnosis

B Treatment: curative, palliative, adjuvant; used in conjunction with chemotherapy or surgery

### **Action**

A Disrupts tissue by altering function during DNA synthesis

B Rapidly reproducing malignant cells are most sensitive to radiation

### **Examples**

A Alpha particle: fast-moving helium nucleus; slight penetration

B Beta particle: fast-moving electron; moderate penetration

C Gamma ray: similar to light ray; high penetration

- D Gold ( $^{198}\text{Au}$ ): effective for complications of ascites and pleural effusion
- E Sodium iodide ( $^{131}\text{I}$ ): effective for thyroid gland
- F Sodium phosphate ( $^{32}\text{P}$ ): effective for erythrocytes
- G Proton therapy: accurately targets tumor, thereby minimizing collateral tissue damage

## **Methods of Delivery**

- A External beam radiotherapy or teletherapy delivers radiation to a tumor by an external machine (cobalt or linear accelerator) at a predetermined distance
- B Internal radiation therapy or brachytherapy delivers radiation by systemic, interstitial, or intracavity means
  1. Systemic (metabolized): administration by intravenous or oral routes
  2. Interstitial: implantation of needles, wires, or seeds into tissue
  3. Intracavity radiation: placement of an implant into a body cavity; may require a surgical procedure

## **Major Side Effects**

- A Localized skin irritation; erythema to moist desquamation
- B Vary based on site and size of treatment field
  1. GI tract: nausea, vomiting, diarrhea, xerostomia, mucositis, dysphagia
  2. Gonads: temporary or permanent sterility
  3. Bone marrow: leukopenia, thrombocytopenia, anemia
  4. Respiratory tract: pneumonitis, cough, dyspnea
  5. Genitourinary tract: cystitis, urethritis
  6. Heart: fibrosis
  7. Internal radiotherapy: excessive tissue sloughing can cause hemorrhage, pain, and/or infection

# **Bone Marrow Transplantation**

## **Purpose**

- A Treatment of hematologic cancer
- B Treatment of certain solid tumor recurrences that require ablative chemotherapy, which destroys bone marrow

## **Types**

- A Autologous: bone marrow is removed from client and reinfused after high-dose chemotherapy
- B Allogeneic: bone marrow from donor with compatible human leukocyte antigen (HLA); infused after client's own bone marrow is destroyed by chemotherapy or radiation
- C Syngeneic: bone marrow is obtained from identical twin
- D Peripheral stem cell transplantation: after stem cell production is stimulated by

administration of growth factor, cells are collected by apheresis and reinfused after high-dose chemotherapy

## **Major Side Effects**

A Infection, fever, chills

B Venous occlusive disease: vascular injury to liver as result of high-dose chemotherapy during first 30 days after transplant

C Graft-versus-host disease: transplanted bone marrow activates immune response against recipient's tissue

D Bone marrow: failure to respond and proliferate limits blood-making capacity, leading to hemorrhage and infection

E GI: stomatitis, nausea, vomiting, diarrhea

F Cardiovascular: hypotension, hypertension, tachycardia, chest pain

G Respiratory: shortness of breath, pneumonia

## **General Nursing Care of Clients with Neoplastic Disorders**

### **Assessment/Analysis**

1. Onset and progression of clinical indicators
2. General health and nutritional status
3. Understanding of disease and treatment plan
4. Laboratory results (e.g., CBC, electrolytes, levels of tumor-specific antigens)

### **Planning/Implementation**

1. Instruct regarding measures to limit infection (e.g., avoiding crowds; hand washing; remaining in home [safer than hospital environment because hospitals harbor pathogens to which client is not usually exposed]); instruct to report body temperature higher than 100° F (37.7° C)
2. Use special measures to limit injury (e.g., gentle oral hygiene, nonalcohol-based mouthwash; move slowly and support joints to prevent pathologic fractures)
3. Explain side effects that influence appearance and encourage positive coping strategies (e.g., purchase of wigs, scarves, hats)
4. Administer prescribed medications to reduce or eliminate nausea (e.g., antiemetics)
5. Monitor blood values during therapy
  - a. WBCs, RBCs, platelets
  - b. Tumor markers: alpha fetoprotein—liver, testes; CA-125—GI, ovaries; carcinoembryonic antigen (CEA)—breast, colon, lung; prostate specific antigen (PSA)—prostate
6. Administer prescribed colony-stimulating factors to increase production of WBCs and RBCs; epoetin alfa (Epogen) and filgrastim (Neupogen); administer prescribed platelet transfusions
7. Offer emotional support to client and family; answer questions and encourage

- verbalization of fears
- 8. Encourage delegation and organization of activity to conserve decreasing energy
  - 9. Encourage to enroll in American Cancer Society’s “Look Good, Feel Better” program
  - 10. Support natural defense mechanisms (e.g., encourage intake of foods rich in immune-stimulating nutrients, especially vitamins A, C, and E, and mineral selenium)
  - 11. Implement measures to support nutritional intake ([Table 3-6: Nursing Care to Promote Nutritional Intake](#))

---

**Table 3-6**

**Nursing Care to Promote Nutritional Intake**

---

Symptom/ Problem	Nurse Should Encourage Client to
Nausea	<ul style="list-style-type: none"> <li>Eat small, frequent meals</li> <li>Avoid high-fat, greasy foods</li> <li>Eat cool or room-temperature foods</li> <li>Avoid lying flat after eating</li> <li>Take medications after meal</li> </ul>
Sore mouth or throat	<ul style="list-style-type: none"> <li>Eat soft, moist foods</li> <li>Avoid spicy or acidic foods</li> <li>Experiment with temperature of foods (avoid very hot or very cold foods; cool or room-temperature foods are best)</li> <li>Use nutrient- and energy-dense foods to maximize oral intake</li> </ul>
Xerostomia (dry mouth)	<ul style="list-style-type: none"> <li>Select foods that are moist or served with a sauce or gravy</li> <li>Consume liquids at mealtimes and extra fluids between meals</li> <li>Practice effective oral hygiene: flossing, brushing, and rinsing; seek regular dental care</li> <li>Use fluoride gels or mouthwashes</li> <li>Consider prophylactic antifungal therapy</li> <li>Chew sugarless gum or suck mints</li> </ul>
Difficulty with breathing	<ul style="list-style-type: none"> <li>Use easy-to-eat foods</li> <li>Use nutrient- and energy-dense foods</li> </ul>
Diarrhea	<ul style="list-style-type: none"> <li>Replace fluid and electrolyte losses</li> <li>Eat low-insoluble and high-soluble fiber foods</li> <li>Consider possible benefits from low-lactose diet</li> <li>Consume low-fat diet if indicated</li> <li>Avoid gas-causing foods and beverages</li> <li>Avoid caffeine</li> <li>Take medications after meal</li> </ul>

Constipation	Increase fluid intake Increase dietary fiber intake
Inadequate oral intake	Consume nutrient- and energy-dense foods, including nutritional supplements Eat small, frequent meals and snacks Consider alternative nutrition support or appetite stimulant such as Megace or Marinol
Fatigue	Obtain adequate sleep, relaxation, exercise Consume adequate diet, especially foods rich in vitamins B <sub>12</sub> , A, C, folate, and carotene or zinc; inadequate amounts may cause fatigue Avoid caffeine, alcohol, cigarette smoking, and recreational drug use Avoid stress and seek treatment of anxiety or depression Identify and manage possible causes for anemia; take prescribed medications—AZT, Bactrim, dapsone, ganciclovir, interferon, pyrimethamine; other causes of anemia—alcohol abuse, bleeding, <i>Mycobacterium avium</i> complex, tuberculosis, fungal infections, cytomegalovirus
Body cell mass loss	Consume adequate diet Perform resistance exercises Seek diagnostic testing for testosterone deficiency; take anabolic agents if prescribed

Modified from Mahan LK, Escott-Stump S: *Krause's food, nutrition, & diet therapy*, ed 12, St. Louis, 2008, Saunders.

12. Encourage women of childbearing age to use birth control measures while receiving therapy because of mutagenic/teratogenic effects; avoid use of birth control pill
13. Counsel regarding use of sperm or ova harvesting if permanent infertility may result
14. Encourage fluid intake (3000 mL/24 hr); monitor I&O
15. Assess for presence of pain; administer analgesics or antidepressant to control pain; provide nonpharmacologic comfort measures
16. Encourage to become involved in decision making; support decisions whenever possible
17. Help to discriminate between scientifically based therapy versus fraudulent therapy
18. Provide specific care for clients receiving chemotherapy
  - a. Monitor IV infusion site for infiltration of chemotherapeutic agent capable of causing tissue necrosis (vesicant)
  - b. Follow established protocols for handling chemotherapeutic agents and equipment to

minimize nurses' exposure

- c. Institute protective isolation if WBC count decreases below  $1000/\text{mm}^3$
  - d. Observe for signs of bleeding; avoid anticoagulants because of decreased platelets
  - e. Prevent bleeding (e.g., avoid use of rectal thermometers, enemas, IM injections, and razor blades)
  - f. Monitor renal function for nephrotoxicity
  - g. Monitor vital signs; monitor for cardiac toxicity
  - h. Encourage checking with health care provider before consuming OTC drugs, such as aspirin; avoid alcoholic beverages
  - i. Follow sterile protocol when accessing implantable port; use noncoring needle (Huber) to access port; when not in use, heparin or saline flushes are used to maintain port patency depending on manufacturer's directions
19. Provide specific care for clients receiving external radiation
- a. Assess skin for erythema or moist desquamation; avoid creams, soaps, powders, cosmetics, perfumes, and deodorants in area during treatment periods
  - b. Instruct to wear loose-fitting cotton clothing; protect skin from sunlight
  - c. Promote use of gentle detergents (e.g., Dreft or Ivory Snow) to wash clothing
  - d. Teach to avoid sources of heat or cold (e.g., heating pads, sunlamps, ice bags, cold weather), salt water, chlorinated pools; do not shave hair within treatment field during therapy
  - e. Apply nonadherent dressing to areas of skin breakdown
  - f. Reassure others that client is not a source of radiation
20. Provide specific care for clients receiving internal radiation
- a. Explain procedures involved and side effects that may occur
  - b. Explain need for isolation; explain to client and visitors amount of time visitors can spend in room and that proximity to client will be limited to avoid overexposure to radiation; restrict children and pregnant women from visiting; health team members must use dosimeter badge to monitor exposure
  - c. Inspect implant for proper positioning and prevent dislodgement of intercavity radiation implants to avoid irradiation of adjacent healthy tissue (e.g., bed rest, urinary retention catheter, low-residue diet, antidiarrheal agents)
  - d. Use principles of time, distance, and shielding to minimize staff exposure
  - e. Provide only necessary hygiene while implant is in place
  - f. Ascertain if body excreta has to be placed in lead containers for disposal when systemic metabolized radiation is used
  - g. If radiation source becomes dislodged use long-handled forceps to place in lead container to prevent contamination of environment; immediately inform radiation therapist and radiation safety officer
  - h. Radiation for prostate cancer: assess for signs of bladder irritability such as nocturia, urgency, dysuria
  - i. Radiation for cervical cancer: keep supine with head of bed flat or only slightly elevated, maintain patency of urinary catheter, provide low-residue diet
21. Provide specific care for clients receiving radiation via an unsealed source (IV, oral, or

direct instillation into body cavity)

- a. Isotope may be excreted in body waste; instruct to flush toilet several times after each use for several days; additional precautions may be necessary depending on radioisotope used
  - b. Provide paper plates and disposable utensils
22. Begin palliative care early in cancer treatment
23. Inform about and support choice of hospice care when curative options are exhausted; recommend multidisciplinary services to support quality rather than quantity of remaining life (e.g., pain management, spiritual support)

## **Evaluation/Outcomes**

- 1. Remains free from infection
- 2. Verbalizes feelings about disease and treatment
- 3. Maintains skin and mucous membrane integrity
- 4. Maintains body weight within expected range
- 5. Verbalizes details concerning self-care related to treatment regimen

# Emergency Situations

## Concepts Related to First Aid

A Maintain or establish the ABCs: **A**irway, **B**reathing, **C**irculation

B Provide physical safety

1. Remove from immediate danger
2. Control bleeding
3. Avoid unnecessary movement of spinal column or extremities; use neck brace and back board; consider all clients experiencing trauma to have an unstable spine until ruled out with radiograph
4. Monitor level of consciousness

C Establish priorities

1. Triage: system of client evaluation to establish priorities and assign appropriate treatment or personnel
2. Determination of priority
  - a. Emergency situations: greatest risk receives care first
  - b. Major disasters: classification based on principles to benefit largest number; those requiring minimal care to save their lives or to be available to help others are treated first; those requiring highly specialized care may be given minimal or no care; **Simple Triage And Rapid Transport (START)** system can be used to categorize individuals
    - (1) Red: critically ill individuals who need immediate care
    - (2) Yellow: injured individuals whose medical care needs can be delayed
    - (3) Green: individuals who can ambulate and care for their own injuries
    - (4) Black: individuals with catastrophic injuries and who are expected to die

D Offer psychologic support

1. Reduce panic to prevent its spread
2. Establish and maintain open communication with health care providers and affected individuals
3. Arrange for contact between affected individuals and their families as soon as feasible

## Specific Emergencies

A Near-drowning

1. Assessment

- a. Airway for signs of possible airway obstruction from bronchospasm
- b. Adventitious or absent breath sounds
- c. Hypoxia, hypercarbia, and acidosis
- d. Possible pulmonary edema
  - (1) Salt water: high osmotic pressure of aspirated water draws additional fluid into alveolar spaces from vascular bed
  - (2) Freshwater: removes surfactant, leading to alveolar collapse

## 2. Treatment and nursing care

- a. Establish airway and ventilate with 100% oxygen and positive pressure
- b. Implement prescribed interventions to correct acidosis
- c. Insert nasogastric tube and decompress stomach to prevent aspiration of gastric contents
- d. Treat pulmonary edema and hypothermia if present

## B Heatstroke

### 1. Assessment

- a. Risk factors: advanced age, strenuous exercise in heat, medications that interfere with perspiring (e.g., antipsychotics and anticholinergics)
- b. Hot, dry, flushed skin progressing to pallor in late circulatory collapse
- c. Elevation of body temperature greater than 105° F (40.5° C)
- d. Reports of dizziness, nausea, and headaches
- e. Seizures
- f. Altered level of consciousness

### 2. Treatment and nursing care

- a. Rapidly reduce temperature (e.g., hypothermia blanket or mattress, cool-water baths, cool enemas)
- b. Administer oxygen to meet increased metabolic demands
- c. Institute seizure precautions

## C Hypothermia

### 1. Assessment

- a. Risk factors: exposure to cold; submersion in cold water; age (e.g., older adults, very young children)
- b. Local (frostbite): pallor, paresthesia, pain to absence of sensation of involved body part
- c. Systemic: core temperature less than 94° F (34.4° C); decreased level of consciousness; weak, irregular pulse

### 2. Treatment and nursing care

- a. Monitor core temperature
- b. Monitor cardiac status and levels of arterial blood gases, electrolytes, glucose, and blood urea nitrogen (BUN)
- c. Rewarm
  - (1) Systemic: institute core rewarming with heated oxygen and/or irrigations before surface rewarming to prevent cardiovascular collapse; warm IV fluids according to agency policy
  - (2) Local: institute controlled rewarming at temperatures of 98.6° to 104° F; avoid massage to prevent further injury
- d. Correct fluid and electrolyte imbalances

## D Terrorism

### 1. Threat or intentional use of violence to intimidate society to achieve religious or politically motivated goals

### 2. Types: conventional weapons (bombs, guns); nonconventional weapons (biologic,

chemical, radiation)

3. Disaster planning: mitigation (minimizing harmful effects of disaster); preparedness (having disaster plan in place); response (providing assistance to meet needs as result of situation); and recovery (reconstructing)
4. Nursing responsibilities for nonconventional terrorist acts (follow agency policy associated with exposure to specific agent)
  - a. Surveillance: detection and reporting of unusual pattern of clinical indicators (vesicular lesions, vomiting, diarrhea, fever, erythema)
  - b. Immunizations: nurses should be immunized first and then administer immunizations to noninfected individuals as available
  - c. Isolation: use standard and transmission-based precautions in response to bioterrorism event; use of personal protective equipment may be expanded to include gas mask if contaminants are aerosolized
  - d. Decontamination: remove clothing and jewelry and thoroughly shower individual with soap and water (or bleach solution and rinse after 15 minutes) to remove residual chemical, biologic, or radiation contaminants; contain clothing in plastic bags
  - e. Treatment to counteract agent: anthrax (ciprofloxacin [Cipro]); nerve agents (atropine); internal radiation from drinking radiation-contaminated water (chelating agents)

# CHAPTER 4

# Foundations of Nursing Practice

---

## Review Questions with Answers and Rationales

### Questions

---

**Note:** Thousands of additional practice questions are available on the enclosed companion CD.

► Denotes alternate format question.

1. A nurse is caring for a client who has paraplegia as a result of a spinal cord injury. Which rehabilitation plan will be **most** effective for this client?

1. Arrangements will be made by the client and the client's family.
2. The plan is formulated and implemented early in the client's care.
3. The rehabilitation is minimal and short term because the client will return to former activities.
4. Arrangements will be made for long-term care because the client is no longer capable of self-care.

2. What is a basic concept associated with rehabilitation that the nurse should consider when formulating discharge plans for clients?

1. Rehabilitation needs are best met by the client's family and community resources.
2. Rehabilitation is a specialty area with unique methods for meeting clients' needs.
3. Immediate or potential rehabilitation needs are exhibited by clients with health problems.
4. Clients who are returning to their usual activities following hospitalization do not require rehabilitation.

3. A nurse is teaching a client how to use the call bell system. Which level of Maslow's Hierarchy of Needs does this nursing action address?

1. Safety
2. Self-esteem
3. Physiologic
4. Interpersonal

4. A nurse is supportive of a child receiving long-term rehabilitation in the home rather than in a health care facility. Why is living with the family so important to a child's emotional development?

1. It provides rewards and punishment.
2. The child's development is supported.
3. It reflects the mores of a larger society.
4. The child's identity and roles are learned.
5. A nurse is discussing Alcoholics Anonymous (AA) with a client. What behavior

expected of members of AA should the nurse include in the discussion?

1. Speaking aloud at weekly meetings
2. Promising to attend at least 12 meetings yearly
3. Maintaining controlled drinking after 6 months
4. Acknowledging an inability to control the problem

6. A nurse discusses the philosophy of Alcoholics Anonymous (AA) with the client who has a history of alcoholism. What need must self-help groups such as AA meet to be successful?

1. Trust
2. Growth
3. Belonging
4. Independence

7. A daughter of a Chinese-speaking client approaches a nurse and asks multiple questions while maintaining direct eye contact. What culturally related concept does the daughter's behavior reflect?

1. Prejudice
2. Stereotyping
3. Assimilation
4. Ethnocentrism

8. A nurse manager works on a unit where the nursing staff members are uncomfortable taking care of clients from cultures that are different from their own. How should the nurse manager address this situation?

1. Assign articles about various cultures so that they can become more knowledgeable.
2. Relocate the nurses to units where they will not have to care for clients from a variety of cultures.
3. Rotate the nurses' assignments so they have an equal opportunity to care for clients from other cultures.
4. Plan a workshop that offers opportunities to learn about the cultures they might encounter while at work.

9. A nurse is teaching a parenting class. What should the nurse suggest about managing the behavior of a young school-age child?

1. Avoid answering questions.
2. Give the child a list of expectations.
3. Be consistent about established rules.
4. Allow the child to plan the day's activities.

10. A nurse in the health clinic is counseling a college student who was recently diagnosed with asthma. On what aspect of care should the nurse focus?

1. Teaching how to make a room allergy-free
2. Referring to a support group for individuals with asthma
3. Arranging with the college to ensure a speedy return to classes
4. Evaluating whether the necessary lifestyle changes are understood

11. Nurses are held responsible for the commission of a tort. The nurse understands that a tort is:

1. the application of force to the body of another by a reasonable individual.
2. an illegality committed by one person against the property or person of another.
3. doing something that a reasonable person under ordinary circumstances would not do.
4. an illegality committed against the public and punishable by the law through the courts.

12. A client is placed on a stretcher and restrained with straps while being transported to the x-ray department. A strap breaks, and the client falls to the floor, sustaining a fractured arm. Later the client shows the strap to the nurse manager, stating, "See, the strap is worn just at the spot where it snapped." What is the nurse's accountability regarding this incident?

1. Exempt from any lawsuit because of the doctrine of *respondeat superior*
2. Totally responsible for the obvious negligence because of failure to report defective equipment
3. Liable, along with the employer, for misapplication of equipment or use of defective equipment that harms the client
4. Exonerated, because only the hospital, as principal employer, is responsible for the quality and maintenance of equipment

13. A 2-year-old child admitted with a diagnosis of pneumonia was administered antibiotics, fluids, and oxygen. The child's temperature increased until it reached 103° F. When notified, the health care provider determined that there was no need to change treatment, even though the child had a history of febrile seizures. Although concerned, the nurse took no further action. Later, the child had a seizure that resulted in neurologic impairment. Legally, who is responsible for the child's injury?

1. Health care provider, because this decision took precedence over the nurse's concern
2. Health care provider, because of total responsibility for the child's health and treatment regimen
3. Nurse, because failure to further question the health care provider about the child's status placed the child at risk
4. Neither, because high fevers are common in children and the health care provider had little cause for concern

14. A graduate nurse is preparing to apply to the State Board of Nursing for licensure to practice as a registered professional nurse. What group primarily is protected under the regulations of the practice of nursing?

1. The public
2. Practicing nurses
3. The employing agency
4. People with health problems

15. A client with coronary artery disease has a sudden episode of cyanosis and a change in respirations. The nurse starts oxygen administration immediately. Legally, should the nurse have administered the oxygen?

1. The oxygen had not been ordered and therefore should not have been administered.
2. The symptoms were too vague for the nurse to determine a need for administering oxygen.

3. The nurse's observations were sufficient, and therefore oxygen should have been administered.
4. The health care provider should have been called for an order before the nurse administered the oxygen.
16. An adolescent is taken to the emergency department of the local hospital after stepping on a nail. The puncture wound is cleansed and a sterile dressing applied. The nurse asks about having had a tetanus immunization. The adolescent responds that all immunizations are up to date. Penicillin is administered, and the client is sent home with instructions to return if there is any change in the wound area. A few days later, the client is admitted to the hospital with a diagnosis of tetanus. Legally, what is the nurse's responsibility in this situation?
  1. The nurse's judgment was adequate, and the client was treated accordingly.
  2. The possibility of tetanus was not foreseen because the client was immunized.
  3. Nurses should routinely administer immunization against tetanus after such an injury.
  4. Assessment by the nurse was incomplete, and as a result the treatment was insufficient.
17. When being interviewed for a position as a registered professional nurse, the applicant is asked to identify an example of an intentional tort. What is the appropriate response?
  1. Negligence
  2. Malpractice
  3. Breach of duty
  4. False imprisonment
18. Several recently licensed registered nurses are discussing whether they should purchase personal professional liability insurance. Which statement indicates the **most** accurate information about professional liability insurance?
  1. "If you have liability insurance, you are more likely to be sued."
  2. "Your employer provides you with the liability insurance you will need."
  3. "Liability insurance is not available for nursing professionals working in a hospital."
  4. "Personal liability insurance offers representation if the State Board of Nursing files charges against you."
19. A 3-year-old child with eczema of the face and arms has disregarded the nurse's warnings to "stop scratching, or else!" The nurse finds the toddler scratching so intensely that the arms are bleeding. The nurse then ties the toddler's arms to the crib sides, saying, "I'm going to teach you one way or another." How should the nurse's behavior be interpreted?
  1. These actions can be construed as assault and battery.
  2. The problem was resolved with forethought and accountability.
  3. Skin must be protected, and the actions taken were by a reasonably prudent nurse.
  4. The nurse had tried to reason with the toddler and expected understanding and cooperation.
20. A nurse is teaching a group of parents about child abuse. What definition of assault should the nurse include in the teaching plan?

1. Assault is a threat to do bodily harm to another person.
  2. It is a legal wrong committed by one person against the property of another.
  3. It is a legal wrong committed against the public that is punishable by state law.
  4. Assault is the application of force to another person without lawful justification.
21. A nurse is teaching staff members about the legal terminology used in child abuse. What definition of battery should the nurse include in the teaching?
1. Maligning a person's character while threatening to do bodily harm
  2. A legal wrong committed by one person against property of another
  3. The application of force to another person without lawful justification
  4. Behaving in a way that a reasonable person with the same education would not
22. A toddler screams and cries noisily after parental visits, disturbing all the other children. When the crying is particularly loud and prolonged, the nurse puts the crib in a separate room and closes the door. The toddler is left there until the crying ceases, a matter of 30 or 45 minutes. Legally, how should this behavior be interpreted?
1. Limits had to be set to control the child's crying.
  2. The child had a right to remain in the room with the other children.
  3. The child had to be removed because the other children needed to be considered.
  4. Segregation of the child for more than half an hour was too long a period of time.
23. A pregnant woman is admitted with a tentative diagnosis of placenta previa. The nurse implements orders to start an IV infusion, administer oxygen, and draw blood for laboratory tests. The client's apprehension is increasing, and she asks the nurse what is happening. The nurse tells her not to worry, that she is going to be all right, and that everything is under control. What is the **best** interpretation of the nurse's statement?
1. Adequate, because the preparations are routine and need no explanation
  2. Effective, because the client's anxieties would increase if she knew the danger involved
  3. Questionable, because the client has the right to know what treatment is being given and why
  4. Incorrect, because only the health care provider should offer assurances about management of care
24. What should the nurse do **initially** when obtaining consent for surgery?
1. Describe the risks involved in the surgery.
  2. Explain that obtaining the signature is routine for any surgery.
  3. Witness the client's signature, which the nurse's signature will document.
  4. Determine whether the client's knowledge level is sufficient to give consent.
25. A client who has been told she needs a hysterectomy for cervical cancer is upset about being unable to have a third child. What is the **next** nursing action?
1. Evaluate her willingness to pursue adoption.
  2. Encourage her to focus on her own recovery.
  3. Emphasize that she does have two children already.
  4. Ensure that other treatment options for her will be explored.
26. The family of an older adult who is aphasic reports to the nurse manager that the primary nurse failed to obtain a signed consent before inserting an indwelling catheter to measure hourly output. What should the nurse manager consider before responding?

1. Procedures for a client's benefit do not require a signed consent.
2. Clients who are aphasic are incapable of signing an informed consent.
3. A separate signed informed consent for routine treatments is unnecessary.
4. A specific intervention without a client's signed consent is an invasion of rights.
27. The spouse of a comatose client who has severe internal bleeding refuses to allow transfusions of whole blood because they are Jehovah's Witnesses. What action should the nurse take?
  1. Institute the ordered blood transfusion because the client's survival depends on volume replacement.
  2. Clarify the reason why the transfusion is necessary and explain the implications if there is no transfusion.
  3. Phone the health care provider for an administrative order to give the transfusion under these circumstances.
  4. Give the spouse a treatment refusal form to sign and notify the health care provider that a court order can now be sought.
28. A client is voluntarily admitted to a psychiatric unit. Later, the client develops severe pain in the right lower quadrant and is diagnosed as having acute appendicitis. How should the nurse prepare the client for the appendectomy?
  1. Have two nurses witness the client signing the operative consent form.
  2. Ensure that the surgeon and the psychiatrist sign for the surgery because it is an emergency procedure.
  3. Ask the client to sign the operative consent form after the client has been informed of the procedure and required care.
  4. Inform the client's next of kin that it will be necessary for one of them to sign the consent form because the client is on a psychiatric unit.
29. What should the nurse consider when obtaining an informed consent from a 17-year-old adolescent?
  1. If the client is allowed to give consent
  2. The client cannot make informed decisions about health care.
  3. If the client is permitted to give voluntary consent when parents are not available
  4. The client probably will be unable to choose between alternatives when asked to consent.
30. A client with rheumatoid arthritis does not want the prescribed cortisone and informs the nurse. Later, the nurse attempts to administer cortisone. When the client asks what the medication is, the nurse gives an evasive answer. The client takes the medication and later discovers that it was cortisone. The client states an intent to sue. What factors in this situation must be considered in a legal action? **Select all that apply.**
  1. Clients have a right to refuse treatment.
  2. Nurses are required to answer clients truthfully.
  3. The health care provider should have been notified.
  4. The client had insufficient knowledge to make such a decision.
  5. Legally prescribed medications are administered despite a client's objections.
31. A client using fentanyl (Duragesic) transdermal patches for pain management in late-

stage cancer dies. What should the hospice nurse who is caring for this client do about the patch?

1. Tell the family to remove and dispose of the patch.
2. Leave the patch in place for the mortician to remove.
3. Have the family return the patch to the pharmacy for disposal.
4. Remove and dispose of the patch in an appropriate receptacle.

32. What is a nurse's responsibility when administering prescribed opioid analgesics?

**Select all that apply.**

1. Count the client's respirations.
2. Document the intensity of the client's pain.
3. Withhold the medication if the client reports pruritus.
4. Verify the number of doses in the locked cabinet before administering the prescribed dose.
5. Discard the medication in the client's toilet before leaving the room if the medication is refused.

33. Which nursing behavior is an intentional tort?

1. Miscounting gauze pads during a client's surgery
2. Causing a burn when applying a wet dressing to a client's extremity
3. Divulging private information about a client's health status to the media
4. Failing to monitor a client's blood pressure before administering an antihypertensive

34. Twenty-four hours after a cesarean birth, a client elects to sign herself and her baby out of the hospital. Staff members are unable to contact her health care provider. The client arrives at the nursery and asks that her infant be given to her to take home. What is the **most** appropriate nursing action?

1. Give the infant to the client and instruct her regarding the infant's care.
2. Explain to the client that she can leave, but her infant must remain in the hospital.
3. Emphasize to the client that the infant is a minor and legally must remain until orders are received.
4. Tell the client that hospital policy prevents the staff from releasing the infant until ready for discharge.

35. A client is hospitalized because of severe depression. The client refuses to eat, stays in bed most of the time, does not talk with family members, and will not leave the room. The nurse attempts to initiate a conversation by asking questions but receives no answers. Finally the nurse tells the client that if there is no response, the nurse will leave and the client will remain alone. How should the nurse's behavior be interpreted?

1. A system of rewards and punishment is being used to motivate the client.
2. Leaving the client alone allows time for the nurse to think of other strategies.
3. This behavior indicates the client's desire for solitude that the nurse is respecting.
4. This threat is considered assault, and the nurse should not have reacted in this manner.

36. During a newborn assessment the nurse identifies that the temperature, pulse, respirations, and other physical characteristics are within the expected range. The nurse records these findings on the clinical record. Legally, how should the nurse's action be

interpreted?

1. The nurse met the requirements set forth in the Nurse Practice Act.
2. This is a medical diagnosis and the nurse overstepped the legal boundary.
3. Nursing assessments are not equivalent to a health care provider's assessments.
4. The initial assessment of the infant's physical status is the responsibility of the client's health care provider.

37. Which nursing action is protected from legal action?

1. Providing health teaching regarding family planning
2. Offering first aid at the scene of an automobile collision
3. Reporting incidents of suspected child abuse to the appropriate authorities
4. Administering resuscitative measures to an unconscious child pulled from a swimming pool

38. A nurse is assigned to care for a newly admitted client. The nurse performs a physical assessment and reviews the admission form and the health care provider's orders. What should the nurse identify as the priorities in this client's plan of care?

Client Chart
<b>Admission Form</b>
56 year old man Married Catholic History of emphysema Terminally ill with cancer of the esophagus
<b>Nursing Physical Assessment</b>
Weak Anorexic Dyspneic Emaciated Apathetic
<b>Health Care Provider's Orders</b>
Soft diet Oxygen at 2 liters via nasal cannula Postural drainage bid Fluticasone 250 mcg/salmeterol 50 mcg (Advair Diskus 250) 2 breaths bid

1. Intake and output
2. Diet and nutrition
3. Hygiene and comfort
4. Body mechanics and posture
39. A weak, dyspneic, terminally ill client is visited frequently by the spouse and teenage children. What should the client's plan of care include?
  1. Foster self-activity whenever possible.
  2. Plan care to be completed at one time followed by a long rest.
  3. Teach family members how to assist with the client's basic care.
  4. Limit visiting to evening hours before the client goes to sleep.
40. A nurse is evaluating a client's knowledge of ambulating with crutches. The nurse identifies the need for further teaching when the client states, "I must practice:
  1. sitting down and standing up."
  2. ambulating several hours a day."
  3. standing and maintaining balance."
  4. doing active exercises on a regular schedule."
41. A nurse educator is presenting information about the nursing process to a class of nursing students. What definition of the nursing process should be included in the presentation?
  1. Procedures used to implement client care
  2. Sequence of steps used to meet the client's needs
  3. Activities employed to identify a client's problem
  4. Mechanisms applied to determine nursing goals for the client
42. Place each step of the nursing process in the order that they should be used.
  1. \_\_\_\_\_ Identify goals for care.
  2. \_\_\_\_\_ Develop a plan of care.
  3. \_\_\_\_\_ State client's nursing needs.
  4. \_\_\_\_\_ Obtain client's nursing history.
  5. \_\_\_\_\_ Implement nursing interventions.
43. A nurse is explaining the nursing process to a nursing assistant. Which step of the nursing process should include interpretation of data collected about the client?
  1. Analysis
  2. Assessment
  3. Nursing interventions
  4. Proposed nursing care
44. Which nurse collaborates directly with the client to establish and implement a basic plan of care after admission?
  1. Primary nurse
  2. Nurse clinician
  3. Nurse coordinator
  4. Clinical nurse specialist
45. A newly oriented home health nurse on a first visit checks the client's vital signs and obtains a blood sample for an international normalization ratio (INR). After completion

of these tasks, the client asks the nurse to straighten the blankets on the bed. What is the nurse's **most** appropriate response?

1. "I would, but my back hurts today."
2. "OK. It will be my good deed for the day."
3. "Of course. I want to do whatever I can for you."
4. "I would like to, but it is not in my job description."

46. A nurse is reviewing a client's plan of care. What is the determining factor in the revision of the plan?

1. Time available for care
2. Validity of the problem
3. Method for providing care
4. Effectiveness of the interventions

47. A nurse is teaching an adolescent about type 1 diabetes and self-care. Which client questions indicate a need for additional teaching in the cognitive domain? **Select all that apply.**

1. "What is diabetes?"
2. "What will my friends think?"
3. "How do I give myself an injection?"
4. "Can you tell me how the glucose monitor works?"
5. "How do I get the insulin from the vial into the syringe?"

48. A nurse is caring for a client with hemiplegia who is frustrated. How can the nurse motivate the client toward independence?

1. Establish long-range goals for the client.
2. Identify errors that the client can correct.
3. Reinforce success in tasks accomplished.
4. Demonstrate ways to promote self-reliance.

49. A client is receiving an antihypertensive drug intravenously for control of severe hypertension. The client's blood pressure is unstable and is 160/94 mm Hg before the infusion. Fifteen minutes after the infusion is started, the blood pressure increases to 180/100 mm Hg. Which type of response is the client demonstrating?

1. Allergic
2. Synergistic
3. Paradoxical
4. Hypersusceptibility

50. A client has an anaphylactic reaction after receiving intravenous penicillin. What does the nurse conclude is the cause of this reaction?

1. An acquired atopic sensitization occurred.
2. There was passive immunity to the penicillin allergen.
3. Antibodies to penicillin developed after a previous exposure.
4. Potent antibodies were produced when the infusion was instituted.

51. At the conclusion of visiting hours, the parent of a 14-year-old adolescent scheduled for orthopedic surgery the next day hands the nurse a bottle of capsules and says, "These are for my child's allergy. Will you be sure my child takes one about 9 tonight?" What is

the nurse's **best** response?

1. "I will give one capsule tonight before bedtime."
2. "I will get a prescription so that the medicine can be taken."
3. "Does your health care provider know about your child's allergy?"
4. "Did you ask your health care provider if your child should have this tonight?"

►52. Filgrastim (Neupogen) 5 mcg/kg/day by injection is prescribed for a client who weighs 132 lb. The vial label reads filgrastim 300 mcg/mL. How many milliliters should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

►53. A child is to receive 60 mg of phenytoin (Dilantin). The medication is available as an oral suspension that contains 125 mg/5 mL. How many milliliters should the nurse administer? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

►54. A health care provider prescribes an IV infusion ampicillin 375 mg every 6 hours. The drug is supplied as 500 mg of powder in a vial. The directions are to mix the powder with 1.8 mL of diluent, which yields 250 mg/mL. How much prepared solution should the nurse administer? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

55. Based on the client's reported pain level, the nurse administers 8 mg of the prescribed morphine. The medication is available in a 10 mg syringe. Wasting of the remaining 2 mg of morphine should be done by the nurse and a witness. Who should be the witness?

1. Nursing supervisor
2. Licensed practical nurse
3. Client's health care provider
4. Designated nursing assistant

56. A nurse is instructing a group of volunteer nurses on the technique of administering the smallpox vaccine. What injection method should the nurse teach?

1. Z-track
2. Intravenous
3. Subcutaneous
4. Intradermal scratch

►57. A primary care provider prescribes cefazolin (Kefzol) 125 mg IM for a client. The vial contains 0.5 gm of Kefzol in powdered form. The instructions indicate to add 2 mL of sterile water to provide a solution that contains 225 mg per mL. Draw a line on the syringe to indicate the volume of medication to the nearest tenth the nurse should administer.

58. A client is scheduled to receive phenytoin (Dilantin) 100 mg orally at 6 PM but is having difficulty swallowing capsules. What method should the nurse use to help the client take the medication?

1. Sprinkle the powder from the capsule into a cup of water.
2. Insert a rectal suppository containing 100 mg of phenytoin.
3. Administer 4 mL of phenytoin suspension containing 125 mg/5 mL.
4. Obtain a change in the administration route to allow an IM injection.

59. What are the desired outcomes that the nurse expects when administering a nonsteroidal antiinflammatory drug (NSAID)? **Select all that apply.**

1. Diuresis
2. Pain relief
3. Antipyresis
4. Bronchodilation
5. Anticoagulation
6. Reduced inflammation

60. A pregnant client is now in the third trimester. The client tells the nurse, "I want to be knocked out for the birth." How should the nurse respond?

1. "You are worried about too much pain."
2. "You don't want to be awake during the birth."
3. "I can understand that because labor is uncomfortable."
4. "I will tell your health care provider about this request."

61. What should a nurse consider when trying to promote affective learning in a client with a newly diagnosed disease?

1. Client's past experiences
2. Client's personal resources
3. Stress of the total situation
4. Type of onset of the disease

62. A nurse is evaluating the appropriateness of a family member's initial response to grief. What is the **most** important factor for the nurse to consider?

1. Personality traits
2. Educational level
3. Cultural background
4. Past experiences with death

63. A nurse considers that communication links people with their surroundings. What should the nurse identify as the **most** important communication link?

1. Social
2. Physical
3. Materialistic
4. Environmental

64. How can a nurse **best** evaluate the effectiveness of communication with a client?

1. Client feedback
2. Medical assessments
3. Health care team conferences

4. Client's physiologic responses
65. A nurse on the medical-surgical unit tells other staff members, "That client can just wait for the lorazepam (Ativan); I get so annoyed when people drink too much." What does this nurse's comment reflect?
1. Demonstration of a personal bias
  2. Problem solving based on assessment
  3. Development of client acuity to set priorities
  4. Consideration of the complexity of client care
66. A client becomes hostile when learning that amputation of a gangrenous toe is being considered. After the client's outburst, what is the **best** indication that the nurse-client interaction has been therapeutic?
1. Increased physical activity
  2. Absence of further outbursts
  3. Relaxation of tensed muscles
  4. Denial of the need for further discussion
67. A nursing supervisor sends a recently oriented nursing assistant to help relieve the burden of care on a short-staffed medical-surgical unit. Which tasks can be delegated to the nursing assistant? **Select all that apply.**
1. Taking routine vital signs
  2. Applying a sterile dressing
  3. Answering clients' call lights
  4. Administering saline infusions
  5. Changing linens on an occupied bed
  6. Documenting client responses to ambulation
68. A teenager begins to cry while talking with the nurse about the problem of not being able to make friends. What is the **most** therapeutic nursing intervention?
1. Sitting quietly with the client
  2. Telling the client that crying is not helpful
  3. Suggesting that the client play a board game
  4. Recommending how the client can change this situation
69. A client has been told to stop smoking by the health care provider. The nurse discovers a pack of cigarettes in the client's bathrobe. What is the nurse's **initial** action?
1. Notify the health care provider.
  2. Report this to the nurse manager.
  3. Tell the client that the cigarettes were found.
  4. Discard the cigarettes without commenting to the client.
70. A client with internal bleeding is in the intensive care unit (ICU) for observation. At the change of shift an alarm sounds, indicating a decrease in blood pressure. What is the **initial** nursing action?
1. Perform an assessment of the client before resuming the change-of-shift report.
  2. Continue the change-of-shift report and include the decrease in blood pressure.
  3. Lower the diastolic pressure limits on the monitor during the change-of-shift report.
  4. Turn off the alarm temporarily and alert the oncoming nurse to the decrease in blood

pressure.

71. While awaiting the biopsy report before removal of a tumor, the client reports being afraid of a diagnosis of cancer. How should the nurse respond?

1. "Worrying is not going to help the situation."
2. "Let's wait until we hear what the biopsy report says."
3. "It is very upsetting to have to wait for a biopsy report."
4. "Operations are not performed unless there are no other options."

72. A client is admitted for surgery. Although not physically distressed, the client appears apprehensive and withdrawn. What is the nurse's **best** action?

1. Orient the client to the unit environment.
2. Have a copy of hospital regulations available.
3. Explain that there is no reason to be concerned.
4. Reassure the client that the staff is available to answer questions.

73. In today's health care delivery system, a nurse as a teacher is confronted with multiple stressors. What is the **major** stressor that detracts from the effectiveness of the teaching effort?

1. Extent of informed consumerism
2. Limited time to engage in teaching
3. Variety of cultural beliefs that exist
4. Deficient motivation of adult learners

74. A nurse in a long-term health care setting is assigned to introduce a client who has a Ph.D. to the other clients. The client tells the nurse, "I wish to be called Doctor." How should the nurse respond?

1. "Your wish will be respected."
2. "Why do you want to be called Doctor?"
3. "Residents here call one another by their first names."
4. "Wouldn't it be better if the others do not know you are a doctor?"

75. "But you don't understand" is a common statement associated with adolescents. What is the nurse's **best** response when hearing this?

1. "I don't understand what you mean."
2. "I do understand; I was a teenager once too."
3. "It would be helpful to understand; let's talk."
4. "It's you who should try to understand others."

76. The nurse manager is planning to assign a nursing assistant (NA) to care for clients. What care can be delegated on a medical-surgical unit to an NA? **Select all that apply.**

1. Performing a bed bath for a client on bed rest
2. Evaluating the effectiveness of acetaminophen and codeine (Tylenol #3)
3. Obtaining an apical pulse rate before oral digoxin (Lanoxin) is administered
4. Assisting a client who has patient-controlled analgesia (PCA) to the bathroom
5. Assessing the wound integrity of a client recovering from an abdominal laparotomy

77. A client is hospitalized with a tentative diagnosis of pancreatic cancer. On admission the client asks the nurse, "Do you think I have anything serious, like cancer?" What is the nurse's **best** reply?

1. "What makes you think you have cancer?"
  2. "I don't know if you do; let's talk about it."
  3. "Why don't you discuss this with your health care provider?"
  4. "You needn't worry now; we won't know the answer for a few days."
78. What type of interview is **most** appropriate when a nurse admits a client to a clinic?
1. Directive
  2. Exploratory
  3. Problem solving
  4. Information giving
79. A pediatric nurse receives a subpoena in a court case involving a child. Before appearing in court, what should the nurse review in addition to the State Nurse Practice Act and the ANA Code for Nurses?
1. Nursing's Social Policy Statement
  2. State law regarding protection of minors
  3. ANA Standards of Clinical Nursing Practice
  4. References regarding a child's right to consent
80. An older adult is treated in the emergency department for soft-tissue injuries that the medical team suspects might be caused by physical abuse. An adult child states that the parent is forgetful and confused and falls all the time. A mini-mental examination indicates that the client is oriented to person, place, and time, and the client does not comment when asked directly how the bruises and abrasions occurred. What is the **next** nursing action?
1. Interview the client without the presence of family members.
  2. Report the abuse to the appropriate state agency for investigation.
  3. Accept the adult child's explanation until more data can be collected.
  4. Refer the client's clinical record to the hospital ethics committee for review.
81. What nursing actions **best** promote communication when obtaining a nursing history? **Select all that apply.**
1. Establishing eye contact
  2. Paraphrasing the client's message
  3. Asking "why" and "how" questions
  4. Using broad, open-ended statements
  5. Reassuring the client that there is no cause for alarm
  6. Asking questions that can be answered with a "yes" or "no"
82. A client is admitted to the hospital for an elective surgical procedure. The client tells a nurse about the emotional stress of recently disclosing being a homosexual to family and friends. What is the nurse's **first** consideration when planning care?
1. Exploring the client's emotional conflict
  2. Identifying personal feelings toward this client
  3. Planning to discuss this with the client's family
  4. Developing a rapport with the client's health care provider
83. A client is brought to the emergency department after a bee sting. The client has a history of allergies to bees and is having difficulty breathing. What client reaction should

cause a nurse the **most** concern?

1. Ischemia
2. Asphyxia
3. Lactic acidosis
4. Increased blood pressure

84. Which nursing interventions require a nurse to use standard precautions? **Select all that apply.**

1. Giving a back rub
2. Administering the first bath to a newborn
3. Emptying a portable wound drainage system
4. Interviewing a client in the emergency department
5. Obtaining the blood pressure of a client who is HIV positive

85. A nurse is assigned to change a central line dressing. The agency policy is to clean the site with Betadine and then cleanse with alcohol. The nurse recently attended a conference that presented information that alcohol should precede Betadine in a dressing change. In addition, an article in a nursing journal stated that a new product was a more effective antibacterial than alcohol and Betadine. The nurse has a sample of the new product. How should the nurse proceed?

1. Use the new product sample when changing the dressing.
2. Cleanse the site with alcohol first and then with Betadine.
3. Cleanse the site with the new product first and then follow the agency's protocol.
4. Follow the agency's policy unless it is contradicted by a health care provider's order.

86. After a storm the rescue team is searching for injured people. A nurse on the team discovers a victim lying next to a broken natural gas line. The victim is not breathing and is bleeding heavily from a leg wound. How should the nurse proceed? Place care in order of their priority.

1. \_\_\_\_\_ Take the victim's vital signs.
2. \_\_\_\_\_ Start rescue breathing immediately.
3. \_\_\_\_\_ Apply surface pressure to the foot wound.
4. \_\_\_\_\_ Remove the victim from the immediate vicinity.
5. \_\_\_\_\_ Transport the victim to the hospital immediately.

87. A nurse is responding to the needs of victims at a collapsed building. What principle guides the nurse's priorities during this disaster?

1. Hemorrhage necessitates immediate care to save the most lives.
2. Those requiring minimal care are treated first so they can help others.
3. Victims with head injuries are treated first because the care is most complex.
4. Children receive the highest priority because they have the greatest life expectancy.

88. A recent immigrant from mainland China is critically ill and dying. What question should the nurse ask when collecting information to meet the emotional needs of this client?

1. "Do you like living in this country?"
2. "When did you come to this country?"
3. "Is there a family member who can translate for you?"

4. "Which family member do you prefer to receive information?"
89. A client with a terminal illness reaches the stage of acceptance. How can the nurse **best** help the client during this stage?
1. Accept the client's crying.
  2. Encourage unrestricted family visits.
  3. Explain details of the care being given.
  4. Stay nearby without initiating conversation.
90. A nurse is assessing the needs of a client who just learned that a tumor is malignant, has metastasized to several organs, and that the illness is terminal. What behavior does the nurse expect the client to exhibit during the initial stage of grieving?
1. Crying uncontrollably
  2. Criticizing medical care
  3. Refusing to receive visitors
  4. Asking for a second opinion
91. A client with cancer of the lung says to the nurse, "If I could just be free of pain for a few days, I might be able to eat more and regain strength." Which stage of grieving does the nurse conclude the client is in?
1. Bargaining
  2. Frustration
  3. Depression
  4. Rationalization
92. A client who has reached the stage of acceptance in the grieving process appears peaceful, but demonstrates a lack of involvement with the environment. How should the nurse address this behavior?
1. Ignore the client's behavior when possible.
  2. Accept the behavior the client is exhibiting.
  3. Explore the reality of the situation with the client.
  4. Encourage participation within the client's environment.
93. A client has a right above-the-knee amputation after trauma sustained in a work-related accident. Upon awakening from surgery, the client states, "What happened to me? I don't remember a thing." What is the nurse's **initial** response?
1. "Tell me what you think happened."
  2. "You will remember more as you get better."
  3. "You were in a work-related accident this morning."
  4. "It was necessary to amputate your leg after the accident."
94. After being medicated for anxiety, a client says to a nurse, "I guess you are too busy to stay with me." How should the nurse respond?
1. "I'm so sorry, but I have to see other clients."
  2. "I have to go now, but I will come back in ten minutes."
  3. "You'll be able to rest after the medicine starts working."
  4. "You'll feel better after I've made you more comfortable."
95. A physically ill client is being verbally aggressive to the nursing staff. What is the **most** appropriate initial nursing response?

1. Accept the client's behavior.
  2. Explore the situation with the client.
  3. Withdraw from contact with the client.
  4. Tell the client the reason for the staff's actions.
96. A client asks the nurse, "Should I tell my partner that I just found out I'm HIV positive?" What is the nurse's **most** appropriate response?
1. "This is a decision you alone can make."
  2. "Do not tell your partner unless asked."
  3. "You are having difficulty deciding what to say."
  4. "Tell your partner that you don't know how you became sick."
97. A client becomes anxious after being scheduled for a colostomy. What is the **most** effective way for the nurse to help the client?
1. Administer the prescribed prn sedative.
  2. Encourage the client to express feelings.
  3. Explain the postprocedure course of treatment.
  4. Reassure the client that there are others with this problem.
98. A client with hemiplegia is staring blankly at the wall and reports feeling like half a person. What is the **initial** nursing action?
1. Use techniques to distract the client.
  2. Include the client in decision making.
  3. Offer to spend more time with the client.
  4. Help the client to problem-solve personal issues.
99. While receiving a preoperative enema, a client starts to cry and says, "I'm sorry you have to do this messy thing for me." What is the nurse's **best** response?
1. "I don't mind it."
  2. "You seem upset."
  3. "This is part of my job."
  4. "Nurses get used to this."
100. A nurse is teaching a client about a restricted diet. What is the nurse's **best** initial comment?
1. "What type of foods do you usually eat?"
  2. "You should follow this diet exactly as written."
  3. "You must limit the intake of foods on this special list."
  4. "What do you know about this diet that was ordered for you?"
101. A nurse in the ambulatory preoperative unit identifies that a client is more anxious than most clients. What is the nurse's **best** intervention?
1. Attempt to identify the client's concerns.
  2. Reassure the client that the surgery is routine.
  3. Report the client's anxiety to the health care provider.
  4. Provide privacy by pulling the curtain around the client.
102. A client who was admitted to the hospital with metastatic cancer has a temperature of 100.4° F, a distended abdomen, and abdominal pain. The client asks the nurse, "Do you think that I'm going to have surgery?" How should the nurse respond?

1. "You seem concerned about having surgery."
  2. "Some people with your problem do have surgery."
  3. "I'll find out for you. Your record will show if surgery is scheduled."
  4. "I don't know about any surgery. You'll have to ask your health care provider."
103. What principle must a nurse consider when caring for a client with a closed wound drainage system?
1. Gravity causes fluids to flow down a pressure gradient.
  2. Fluid flow rate is determined by the diameter of the lumen.
  3. Siphoning causes fluids to flow from one level to a lower level.
  4. Fluids flow from an area of higher pressure to one of lower pressure.
104. A client had extensive, prolonged surgery. Which electrolyte level should the nurse monitor **most** closely?
1. Sodium
  2. Calcium
  3. Chloride
  4. Potassium
- ▶105. How should a nurse prepare an IV piggyback (IVPB) medication for administration to a client receiving an IV infusion? **Select all that apply.**
1. Wear clean gloves to check the IV site.
  2. Rotate the bag after adding the medication.
  3. Use 100 mL of fluid to mix the medication.
  4. Change the needle before adding the medication.
  5. Place the IVPB at a lower level than the existing IV.
  6. Use a sterile technique when preparing the medication.
106. A nurse administers an intravenous solution of 0.45% sodium chloride. In what category of fluids does this solution belong?
1. Isotonic
  2. Isomeric
  3. Hypotonic
  4. Hypertonic
107. What clinical finding does a nurse anticipate when admitting a client with an extracellular fluid volume excess?
1. Rapid, thready pulse
  2. Distended jugular veins
  3. Elevated hematocrit level
  4. Increased serum sodium level
108. A nurse is caring for a client with diarrhea. In which clinical indicator does the nurse anticipate a decrease?
1. Pulse rate
  2. Tissue turgor
  3. Specific gravity
  4. Body temperature
109. A client reports vomiting and diarrhea for 3 days. What clinical finding will **most**

accurately indicate that the client has a fluid deficit?

1. Presence of dry skin
2. Loss of body weight
3. Decrease in blood pressure
4. Altered general appearance

110. A client is admitted with metabolic acidosis. The nurse considers that two body systems interact with the bicarbonate buffer system to preserve healthy body fluid pH. What two body systems should the nurse assess for compensatory changes?

1. Skeletal and nervous
2. Circulatory and urinary
3. Respiratory and urinary
4. Muscular and endocrine

111. A nurse is reviewing a client's serum electrolyte laboratory report. What is a comparison between blood plasma and interstitial fluid?

1. They both contain the same kinds of ions.
2. Plasma exerts lower osmotic pressure than does interstitial fluid.
3. Plasma contains more of each kind of ion than does interstitial fluid.
4. Sodium is higher in plasma, whereas potassium is higher in interstitial fluid.

112. A nurse explains to an obese client that the rapid weight loss during the first week after initiating a diet is because of fluid loss. The weight of extracellular body fluid is approximately 20% of the total body weight of an average individual. Which component of the extracellular fluid contributes the **greatest** proportion to this amount?

1. Plasma
2. Interstitial
3. Dense tissue
4. Body secretions

113. A nurse assesses a client's serum electrolyte levels in the laboratory report. What electrolyte in intracellular fluid should the nurse consider **most** important?

1. Sodium
2. Calcium
3. Chloride
4. Potassium

114. A nurse is reviewing the laboratory report of a client with a tentative diagnosis of kidney failure. What mechanism does the nurse expect to be maintained when ammonia is excreted by healthy kidneys?

1. Osmotic pressure of the blood
2. Acid-base balance of the body
3. Low bacterial levels in the urine
4. Normal red blood cell production

115. A nurse is evaluating the effectiveness of treatment for a client with excessive fluid volume. What clinical finding indicates that treatment has been successful?

1. Clear breath sounds
2. Positive pedal pulses

3. Normal potassium level

4. Increased urine specific gravity

116. A nurse is caring for a client with albuminuria resulting in edema. What pressure change does the nurse determine as the cause of the edema?

1. Decrease in tissue hydrostatic pressure

2. Increase in plasma hydrostatic pressure

3. Increase in tissue colloid osmotic pressure

4. Decrease in plasma colloid oncotic pressure

117. A nurse is reviewing the health care provider's orders for a client who was admitted with dehydration as a result of prolonged watery diarrhea. Which order should the nurse question?

1. Oral psyllium (Metamucil)

2. Oral potassium supplement

3. Parenteral half normal saline

4. Parenteral albumin (Albuminar)

118. A nurse is analyzing how a hyperglycemic client's blood glucose can be lowered. The nurse considers that the chemical that buffers the client's excessive acetoacetic acid is:

1. potassium.

2. bicarbonate.

3. carbon dioxide.

4. sodium chloride.

119. For what clinical indicator should a nurse assess a client who is having a gastric lavage?

1. Decreased serum pH

2. Increased serum oxygen level

3. Increased serum bicarbonate level

4. Decreased serum osmotic pressure

120. A client is in a state of uncompensated acidosis. What approximate arterial blood pH does the nurse expect the client to have?

1. 7.20

2. 7.35

3. 7.45

4. 7.48

121. A nurse is concerned that a client is at risk for developing hyperkalemia. Which disease does the client have that has caused this concern?

1. Crohn

2. Cushing

3. End-stage renal

4. Gastroesophageal reflux

122. A client's serum potassium level has increased to 5.8 mEq/L. What action should the nurse implement **first**?

1. Call the laboratory to repeat the test.

2. Take vital signs and notify the health care provider.

3. Inform the cardiac arrest team to place them on alert.

4. Take an electrocardiogram and have lidocaine available.

►123. What clinical indicators should the nurse expect a client with hyperkalemia to exhibit? **Select all that apply.**

1. Tetany

2. Seizures

3. Diarrhea

4. Weakness

5. Dysrhythmias

124. A nurse adds 20 mEq of potassium chloride to the IV solution of a client with diabetic ketoacidosis. What is the **primary** purpose for administering this drug?

1. Treat hyperpnea

2. Prevent flaccid paralysis

3. Replace excessive losses

4. Treat cardiac dysrhythmias

►125. The intake and output of a client over an 8-hour period (8 AM to 4 PM) is:

8 AM: IV with D<sub>5</sub>W infusing and 900 mL left in bag

8:30 AM: 150 mL urine voided

9 AM to 3 PM: 200 mL gastric tube formula and 50 mL water at q3h intervals

1 PM: 220 mL voided

3:15 PM: 235 mL voided

4 PM: IV with 550 mL left in bag

What is the difference between the client's intake and output? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ m/L

126. A nurse is caring for a client with ascites. What does the nurse consider to be the cause of the ascites?

1. Portal hypotension

2. Kidney malfunction

3. Diminished plasma protein level

4. Decreased production of potassium

127. A client is receiving an IV infusion of 5% dextrose in water. The client loses weight and develops a negative nitrogen balance. What nutritional problem prompts the nurse to notify the health care provider?

1. Excessive carbohydrate intake

2. Lack of protein supplementation

3. Insufficient intake of water-soluble vitamins

4. Increased concentration of electrolytes in cells

►128. An IV solution of 1000 mL 5% dextrose in water is to be infused at 125 mL/hr to correct a client's fluid imbalance. The infusion set delivers 15 drops/mL. To ensure that the solution will infuse over an 8-hour period, at how many drops per minute should the nurse set the rate of flow? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ gtt/min

129. What complication is prevented when a nurse addresses the needs of a client who is hyperventilating?

1. Cardiac arrest
2. Carbonic acid deficit
3. Reduction in serum pH
4. Excess oxygen saturation

►130. There was 200 mL left in a client's IV bag when a nurse started the shift. When there was 50 mL left in this bag, the nurse hung a new IV bag containing 1000 mL and discarded the 50 mL from the previous bag. The client received two IVPBs during the shift; each contained 100 mL. At the end of the shift the nurse looks at the IV to document the client's IV fluid intake for the shift. How many mLs of IV fluid did the client receive during the shift? Refer to the illustration below. **Record your answer as a whole number.**

Answer: \_\_\_\_\_ mL

131. An arterial blood gas report indicates the client's pH is 7.25,  $\text{PCO}_2$  is 35 mm Hg, and  $\text{HCO}_3$  is 20 mEq/L. Which disturbance should the nurse identify based on these results?

1. Metabolic acidosis
2. Metabolic alkalosis
3. Respiratory acidosis
4. Respiratory alkalosis

132. A client's arterial blood gas report indicates the pH is 7.52,  $\text{PCO}_2$  is 32 mm Hg, and  $\text{HCO}_3$  is 24 mEq/L. What does the nurse identify as a possible cause of these results?

1. Airway obstruction
2. Inadequate nutrition

3. Prolonged gastric suction

4. Excessive mechanical ventilation

133. A nurse is caring for a client with ascites who is receiving albumin. What infusion rate and oral fluid intake should the nurse expect to have the **greatest** therapeutic effect?

1. Slow IV rate and liberal fluid intake

2. Slow IV rate and restricted fluid intake

3. Rapid IV rate and withheld fluid intake

4. Rapid IV rate and moderate fluid intake

134. A nurse is caring for a client who is receiving serum albumin. What therapeutic effect does the nurse anticipate?

1. Improved clotting of blood

2. Formation of red blood cells

3. Activation of white blood cells

4. Maintenance of oncotic pressure

135. What is the maximum length of time a nurse should allow an IV bag of solution to infuse?

1. 6 hours

2. 12 hours

3. 18 hours

4. 24 hours

136. A client's IV infusion infiltrates. What does the nurse identify as the **most** likely cause of the infiltration?

1. Excessive height of the IV bag

2. Failure to secure the catheter adequately

3. Contamination during the catheter insertion

4. Infusion of a chemically irritating medication

►137. What are the clinical indicators that a nurse should identify when an IV has infiltrated? **Select all that apply.**

1. Heat

2. Pallor

3. Edema

4. Decreased flow rate

5. Increased blood pressure

138. A nurse is caring for a client who is receiving an IV infusion. What should the nurse do **first** if the IV infusion infiltrates?

1. Elevate the IV site.

2. Discontinue the infusion.

3. Attempt to flush the tubing.

4. Apply a warm, moist compress.

►139. A client is to receive 2000 mL of IV fluid in 12 hours. At what rate should the nurse set the electronic infusion control device? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL/hr

140. A client with hypokalemia is placed on a cardiac monitor to evaluate cardiac activity

during IV potassium replacement. Before starting the potassium infusion, what cardiac change is the nurse **most** likely to identify when observing the monitor?

1. Lowering of the T wave
2. Elevation of the ST segment
3. Shortening of the QRS complex
4. Increased deflection of the Q wave

141. A nurse inadvertently allows an IV solution containing potassium to infuse too rapidly. The health care provider prescribes insulin added to a 10% dextrose in water solution. What is the rationale for the order?

1. Potassium moves into body cells with glucose and insulin.
2. Increased insulin accelerates excretion of glucose and potassium.
3. Glucose with insulin increases metabolism, which accelerates potassium excretion.
4. Increased potassium causes a temporary slowing of pancreatic production of insulin.

142. What clinical finding indicates to a nurse that a client may have hypokalemia?

1. Edema
2. Muscle spasms
3. Kussmaul breathing
4. Abdominal distention

▶143. An intravenous piggyback (IVPB) of cefazolin (Kefzol) 500 mg in 50 mL of 5% dextrose in water is to be administered over a 20-minute period. The tubing has a drop factor of 15 drops/mL. At what rate per minute should the nurse regulate the infusion to run? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ gtt/min

144. A spouse spends most of the day with a client who is receiving chemotherapy for inoperable cancer. The spouse asks the nurse, "What can I do to help?" How can the nurse support the client's spouse?

1. Assist the couple to maintain open communication.
2. Offer the couple a description of the disease process.
3. Instruct the spouse about the action of the medications.
4. Meet privately with the spouse to explore personal feelings.

145. During admission a client appears anxious and says to the nurse, "The doctor told me I have lung cancer. My father died from cancer. I wish I had never smoked." What is the nurse's **best** response?

1. "You are concerned about your diagnosis."
2. "You are feeling guilty about your smoking."
3. "There have been advances in lung cancer therapy."
4. "Trust your doctor, who is very competent in treating cancer."

146. When a disaster occurs, the nurse may have to treat mass hysteria first. Which response indicates that an individual should be cared for **first**?

1. Panic
2. Coma
3. Euphoria
4. Depression

147. A client with hypothermia is brought to the emergency department. What treatment does the nurse anticipate?

1. Core rewarming with warm fluids
2. Ambulation to increase metabolism
3. Frequent oral temperature assessments
4. Gastric tube feedings to increase fluid volume

148. An unresponsive older adult is admitted to the emergency department on a hot, humid day. The initial nursing assessment reveals hot, dry skin; a respiratory rate of 36 breaths/min; and a heart rate of 128 beats/min. What is the **initial** nursing action?

1. Offer cool fluids.
2. Suction the airway.
3. Remove the clothing.
4. Prepare for intubation.

149. A nurse is working in a busy emergency department on a hot summer day when four near-drowning victims are admitted. Which near-drowning victim should the nurse assess for signs of hypovolemia?

1. 72-year-old rescued from a lake
2. 2-year-old rescued from a bathtub
3. 50-year-old rescued from the ocean
4. 17-year-old rescued from a backyard pool

►150. What clinical indicators should a nurse identify when assessing a client with pyrexia (fever)? **Select all that apply.**

1. Dyspnea
2. Flushed face
3. Precordial pain
4. Increased pulse rate
5. Increased blood pressure

151. A nurse is caring for a client on bed rest. How can the nurse help prevent a pulmonary embolus?

1. Limit the client's fluid intake.
2. Teach the client how to exercise the legs.
3. Encourage use of the incentive spirometer.
4. Maintain the knee gatch position at an angle.

152. Immediately after receiving spinal anesthesia a client develops hypotension. To what physiologic change does the nurse attribute the decreased blood pressure?

1. Dilation of blood vessels
2. Decreased response of chemoreceptors
3. Decreased strength of cardiac contractions
4. Disruption of cardiac accelerator pathways

153. A client is hospitalized for treatment of severe hypertension. Captopril (Capoten) and alprazolam (Xanax) are prescribed. The client quickly finds fault with the therapeutic regimen and nursing care. What does the nurse determine as the probable cause of this behavior?

1. Denial of illness
  2. Fear of the health problem
  3. Response to cerebral anoxia
  4. Reaction to the antihypertensive drug
154. A 2 g sodium diet is prescribed for a client with stage 2 hypertension, and the nurse teaches the client the rationale for this diet. The client reports distaste for the food. The primary nurse hears the client request that the family “bring in a ham and cheese sandwich and fries.” What is the **most** effective nursing intervention?
1. Discuss the diet with the client and family.
  2. Tell the client why salty foods should not be eaten.
  3. Explain the dietary restriction to the client’s visitors.
  4. Ask the dietitian to teach the client and family about sodium restrictions.
155. A senior high school student, whose immunization status is current, asks the school nurse which immunizations will be included in the precollege physical. Which vaccine should the nurse tell the student to expect to receive?
1. Hepatitis C (HepC)
  2. Influenza type B (HIB)
  3. Measles, mumps, rubella (MMR)
  4. Diphtheria, tetanus, pertussis (TDaP)
156. A 70-year-old client with the diagnosis of heart failure and chronic obstructive pulmonary disease (COPD) is admitted to a unit in a long-term care facility for a cardiopulmonary rehabilitation program. Pneumococcal and flu vaccines are administered. The client asks the nurse if the pneumococcal vaccine has to be taken every year like the flu vaccine. How should the nurse respond?
1. “You need to receive the pneumococcal vaccine every other year.”
  2. “The pneumococcal vaccine should be received in early autumn every year.”
  3. “You should get the flu and pneumococcal vaccines at your annual physical examination.”
  4. “It is unnecessary to have any follow-up injections of the pneumococcal vaccine after this dose.”
157. A nurse is caring for a client with an impaired immune system. Which blood protein associated with the immune system is important for the nurse to consider?
1. Albumin
  2. Globulin
  3. Thrombin
  4. Hemoglobin
158. A client who was exposed to hepatitis A asks why an injection of gamma globulin is needed. Before responding, what should the nurse consider about how it provides passive immunity?
1. It increases production of short-lived antibodies.
  2. It accelerates antigen-antibody union at the hepatic sites.
  3. The lymphatic system is stimulated to produce anti-bodies.
  4. The antigen is neutralized by the antibodies that it supplies.

159. A client is admitted to the emergency department with a contaminated wound. The client is a poor historian, and the nurse realizes that it is impossible to determine whether the client is immunized against tetanus. Which medication does the nurse expect the health care provider to prescribe because it will produce passive immunity for several weeks with minimal danger of an allergic reaction?

1. Tetanus toxoid
2. Equine tetanus antitoxin
3. Human tetanus antitoxin
4. Diphtheria, tetanus, pertussis vaccine

160. A client who is suspected of having tetanus asks a nurse about immunizations against tetanus. Before responding, what should the nurse consider about the benefits of tetanus antitoxin?

1. It stimulates plasma cells directly.
2. A high titer of antibodies is generated.
3. It provides immediate active immunity.
4. A long-lasting passive immunity is produced.

161. What clinical indicator is important for the nurse to assess after a client undergoes a submucosal resection (SMR) for a deviated septum?

1. Occipital headache
2. Periorbital crepitus
3. Expectoration of blood
4. Changes in vocalization

162. A nurse must establish and maintain an airway in a client who has experienced a near-drowning in the ocean. For which potential danger should the nurse assess the client?

1. Alkalosis
2. Renal failure
3. Hypervolemia
4. Pulmonary edema

163. A nurse is caring for a postoperative client who had general anesthesia during surgery. What independent nursing intervention may prevent an accumulation of secretions?

1. Postural drainage
2. Cupping the chest
3. Nasotracheal suctioning
4. Frequent changes of position

164. In what position should the nurse place a client recovering from general anesthesia?

1. Supine
2. Side-lying
3. High-Fowler
4. Trendelenburg

165. What is the **priority** nursing intervention for a client during the immediate postoperative period?

1. Monitoring vital signs
  2. Observing for hemorrhage
  3. Maintaining a patent airway
  4. Recording the intake and output
166. A client has seeds containing radium implanted in the pharyngeal area. What should the nurse include in the client's plan of care?
1. Have the client void every 2 hours.
  2. Maintain the client in an isolation room.
  3. Allow time for the client to verbalize feelings.
  4. Wear 2 pairs of gloves when touching the client during care.
167. A nurse in the postanesthesia care unit (PACU) observes that after an abdominal cholecystectomy a client has serosanguineous drainage on the abdominal dressing. What is the **next** nursing action?
1. Change the dressing.
  2. Reinforce the dressing.
  3. Replace the tape with Montgomery ties.
  4. Support the incision with an abdominal binder.
168. Four days after abdominal surgery a client has not passed flatus and there are no bowel sounds. Paralytic ileus is suspected. What does the nurse conclude is the **most** likely cause of the ileus?
1. Decreased blood supply
  2. Impaired neural functioning
  3. Perforation of the bowel wall
  4. Obstruction of the bowel lumen
- ▶169. A client experiences abdominal distention following surgery. Which nursing actions are appropriate? **Select all that apply.**
1. Encouraging ambulation
  2. Giving sips of ginger ale
  3. Auscultating bowel sounds
  4. Providing a straw for drinking
  5. Offering the prescribed opioid analgesic
- ▶170. A client is admitted with diarrhea, anorexia, weight loss, and abdominal cramps. What clinical manifestations of an electrolyte deficit should the nurse report immediately? **Select all that apply.**
1. Diplopia
  2. Skin rash
  3. Leg cramps
  4. Tachycardia
  5. Muscle weakness
- ▶171. A client is being admitted for a total hip replacement. When is it necessary for the nurse to ensure that a medication reconciliation is completed? **Select all that apply.**
1. After reporting severe pain
  2. On admission to the hospital

3. Upon entering the operating room
4. Before transfer to a rehabilitation facility
5. At time of scheduling for the surgical procedure

►172. A client with arthritis increases the dose of ibuprofen (Motrin, Advil) to abate joint discomfort. After several weeks the client becomes increasingly weak. The health care provider determines that the client is severely anemic and admits the client to the hospital. What clinical indicators does the nurse expect to identify when performing an admission assessment? **Select all that apply.**

1. Melena
2. Tachycardia
3. Constipation
4. Clay-colored stools
5. Painful bowel movements

173. A plan of care for a client with type 1 diabetes includes teaching how to self-administer insulin, adjust insulin dosage, select appropriate food on the ordered diet, and test the serum for glucose. The client demonstrates achievement of these skills and is discharged 5 days following admission. What is the legal implication in this situation?

1. The nurse was functioning as a health teacher.
2. A home health care nurse should have done the health teaching in the client's home.
3. Family members also should have been taught how to administer insulin and perform other aspects of care.
4. Health care providers are responsible for this care, and the nurse should have cleared the teaching plan before its implementation.

174. Why are sink faucets in a client's room considered contaminated?

1. They are not in sterile areas.
2. They are opened with dirty hands.
3. Large numbers of people use them.
4. Water encourages bacterial growth.

175. The nurse is teaching a client about adequate hand hygiene. What component of hand washing should the nurse include that is **most** important for removing microorganisms?

1. Soap
2. Time
3. Water
4. Friction

176. A nurse is applying a dressing to a client's surgical wound using sterile technique. While engaging in this activity, the nurse accidentally places a moist sterile gauze pad on the cloth sterile field. What physical principle is applicable for causing the sterile field to become contaminated?

1. Dialysis
2. Osmosis
3. Diffusion
4. Capillarity

177. A nurse is preparing to change a client's dressing. What is the reason for using surgical asepsis during this procedure?

1. Keeps the area free of microorganisms
2. Confines microorganisms to the surgical site
3. Protects self from microorganisms in the wound
4. Reduces the risk for growing opportunistic microorganisms

178. When assessing an obese client, a nurse observes dehiscence of the abdominal surgical wound with evisceration. The nurse places the client in the low-Fowler position with the knees slightly bent and encourages the client to lie still. What is the **next** nursing action?

1. Obtain the vital signs.
2. Notify the health care provider.
3. Reinsert the protruding organs using aseptic technique.
4. Cover the wound with a sterile towel moistened with normal saline.

179. While caring for a client with a portable wound drainage system, a nurse observes that the collection container is half full and empties it. What is the **next** nursing intervention?

1. Encircle the drainage on the dressing.
2. Irrigate the suction tube with sterile saline.
3. Clean the drainage port with an alcohol wipe.
4. Compress the container before closing the port.

180. A nurse in the surgical intensive care unit is caring for a client with a large surgical incision. What medication does the nurse anticipate will be prescribed for this client?

1. Vitamin A (Aquasol A)
2. Cyanocobalamin (Cobex)
3. Phytonadione (Mephyton)
4. Ascorbic acid (Ascorbicap)

181. During the initial physical assessment of a newly admitted client with a pressure ulcer, a nurse observes that the client's skin is dry and scaly. The nurse applies emollients and reinforces the dressing on the pressure ulcer. Legally, were the nurse's actions adequate?

1. The nurse should have instituted a plan to increase activity.
2. The nurse provided supportive nursing care for the well-being of the client.
3. Debridement of the pressure ulcer should have been done before the dressing was applied.
4. Treatment should not have been instituted until the health care provider's orders were received.

182. An emaciated older adult with dementia develops a large pressure ulcer after refusing to change position for extended periods of time. The family blames the nurses and threatens to sue. What should be considered when deciding who is to blame?

1. The client should have been turned regularly.
2. Older clients frequently develop pressure ulcers.
3. The nurse is not responsible to the client's family.

4. Nurses should respect a client's right not to be moved.

183. After recovery from a modified neck dissection for oropharyngeal cancer, the client receives external radiation to the operative site. For which **most** critical reaction to the radiation should the nurse assess the client?

1. Dry mouth
2. Skin reactions
3. Mucosal edema
4. Bone marrow suppression

184. A client expresses concern about being exposed to radiation therapy because it can cause cancer. What should the nurse emphasize when informing the client about exposure to radiation?

1. The dosage is kept at a minimum.
2. Only a small part of the body is irradiated.
3. The client's physical condition is not a risk factor.
4. Nutritional environment of the affected cells is a risk factor.

185. A client who is to receive radiation therapy for cancer says to the nurse, "My family said I will get a radiation burn." What is the nurse's **best** response?

1. "Your skin will look like a sunburn."
2. "A localized skin reaction usually occurs."
3. "A daily application of an emollient will prevent a burn."
4. "Your family must have had experience with radiation therapy."

186. A nurse applies an ice pack to a client's leg for 20 minutes. What clinical indicator helps the nurse determine the effectiveness of the treatment?

1. Local anesthesia
2. Peripheral vasodilation
3. Depression of vital signs
4. Decreased viscosity of blood

►187. A homeless person is brought to the emergency department after prolonged exposure to cold weather. What clinical manifestations of hypothermia does the nurse anticipate? **Select all that apply.**

1. Stupor
2. Erythema
3. Increased anxiety
4. Rapid respirations
5. Paresthesia in affected body parts

►188. An older adult is brought to the emergency department after being found in the street without a coat during a snowstorm. What actions should the nurse implement? **Select all that apply.**

1. Massage extremities.
2. Obtain a rectal temperature.
3. Assess the fingers for areas of frostbite.
4. Determine client's level of consciousness.
5. Ask for identification so that the family can be notified.

189. A client reports severe pain 2 days after surgery. Which **initial** action should the nurse take after assessing the character of the pain?

1. Encourage rest.
2. Obtain the vital signs.
3. Administer the prn analgesic.
4. Document the client's pain response.

190. A peripheral nerve or dorsal column stimulator is implanted to allay a client's intractable pain. What discharge instructions should the nurse give the client after surgery?

1. Tub baths should be avoided.
2. Analgesics will no longer be necessary.
3. The transmitter must be worn externally.
4. The transmitter will interfere with electronic devices.

191. After abdominal surgery a client reports pain. What action should the nurse take **first**?

1. Reposition the client.
2. Obtain the client's vital signs.
3. Administer the prescribed analgesic.
4. Determine the characteristics of the pain.

192. A client who had abdominal surgery is receiving patient-controlled analgesia (PCA) intravenously to manage pain. The pump is programmed to deliver a basal dose and bolus doses that can be accessed by the client with a lock-out time frame of 10 minutes. The nurse assesses use of the pump during the last hour and identifies that the client attempted to self-administer the analgesic 10 times. Further assessment reveals that the client is still experiencing pain. What should the nurse do **first**?

1. Monitor the client's pain level for another hour.
2. Determine the integrity of the intravenous delivery system.
3. Reprogram the pump to deliver a bolus dose every 8 minutes.
4. Arrange for the client to be evaluated by the health care provider.

193. A client with an inflamed sciatic nerve is to have a conventional transcutaneous electrical nerve stimulation (TENS) device applied to the painful nerve pathway. When operating the TENS unit, which nursing action is appropriate?

1. Maintain the settings programmed by the health care provider.
2. Turn the machine on several times a day for ten to twenty minutes.
3. Adjust the dial on the unit until the client states the pain is relieved.
4. Apply the color-coded electrodes on the client where they are most comfortable.

194. A nurse is caring for a client who had an insertion of radium for cancer of the cervix. For what radium reaction should the nurse assess the client?

1. Pain
2. Nausea
3. Excoriation
4. Restlessness

195. Radium inserted in the vagina of a client is now being removed. What safety

precaution should the nurse employ when assisting with the radium removal?

1. Clean the radium in ether or alcohol.
2. Wear foil-lined rubber gloves while handling the radium.
3. Ensure that long forceps are available for removing the radium.
4. Document how long the radium was in place and when it was removed.

196. A nurse checking the perineum of a client with a radium implant for cervical cancer observes the packing protruding from the vagina. Why must the nurse notify the health care provider to remove it immediately?

1. The radioactive packing will injure healthy tissue.
2. Removal of the packing will prevent excessive blood loss.
3. The exposure of radium to the environment will diminish its effectiveness.
4. Removal of the packing will minimize life-threatening contact with the radiation.

197. A nurse is caring for a client who has a radium implant for cancer of the cervix. What is the priority nursing action?

1. Store urine in lead-lined containers.
2. Restrict visitors to a ten-minute stay.
3. Wear a lead-lined apron when giving care.
4. Avoid giving injections in the gluteal muscle.

198. A client was treated with a radium implant for cancer of the cervix. What information is important for the nurse to teach the client when giving discharge instructions?

1. Limit daily fluid intake.
2. Return for follow-up care.
3. Continue a low-residue diet.
4. Take daily mineral supplements.

199. A client has corrective surgery for a bladder laceration. What nursing intervention takes **priority** during this client's postoperative period?

1. Turning frequently
2. Raising side rails on the bed
3. Providing range-of-motion exercises
4. Massaging the back three times a day

►200. A postmenopausal woman who has cancer of the breast decides to have a lumpectomy followed by chemotherapy. After receiving chemotherapy for several weeks, she says to a nurse at the clinic, "I don't feel well." The nurse reviews the chemotherapeutic medications the client is receiving, checks the laboratory results, and obtains the client's vital signs. Based on this information, what does the nurse conclude is the client's **priority** need?

Client Chart
<b>Medications</b>
cyclophosphamide (Cytosan) DOXOrubicin fluorouracil (5-FU)
<b>Laboratory Results</b>
RBC: 4.2 $\mu$ L WBC: 3000 $\mu$ L Hb: 12.5 g/dL Hct: 39% Platelets: 190,000 $\mu$ L
<b>Vital Signs</b>
Temperature (oral): 99.8° F Pulse: 88 beats/min Resp: 24 breaths/min Blood pressure: 126/88 mm Hg

1. Promoting rest
2. Preventing infection
3. Avoiding bodily harm
4. Maintaining fluid balance

# Answers and Rationales

---

**1. 2 To promote optimism and facilitate smooth functioning, rehabilitation planning should begin on admission to the hospital.**

**1** The client and family often are unaware of the options available in the health care system; the nurse should be available to provide the necessary information and support. **3** Rehabilitation helps a client adjust to a new lifestyle that must compensate for the paralysis. **4** The goal of rehabilitation is to foster independence wherever the client may live after discharge,

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Process](#)

**2. 3 Rehabilitation refers to a process that assists clients to obtain optimal functioning. Care should be initiated immediately when a health problem exists to avoid complications and facilitate recuperation.**

**1** All resources that can be beneficial to client rehabilitation, including the private health care provider and acute care facilities, should be utilized. **2** Rehabilitation is a commonality in all areas of nursing practice. **4** Rehabilitation is necessary to help clients return to a previous or optimal level of functioning.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Health-Illness Continuum and Rehabilitation](#)

**3. 1 A call bell system enables the client to communicate with the staff and supports safety and security, which is a second-level need.**

**2** Self-esteem involves intrapersonal needs, the fourth level of basic needs. **3** Physiologic needs include air, food, and water and represent the first level of needs. **4** Interpersonal needs involve love and belonging, which are third-level needs.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**4. 4 Socialization, values, and role definition are learned within the family and help develop a sense of self. Once established in the family, the child can more easily move into society.**

**1, 2, 3** Although important, this is just one aspect of the family's influence; it is not as important as identity and roles in relation to emotional development.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Groups](#)

**5. 4 A major premise of AA is that to be successful in achieving sobriety, clients with alcohol abuse problems must acknowledge their inability to control their drinking.**

**1** There are no rules about speaking at meetings, although members are strongly encouraged to do so. **2** There are no rules of attendance at meetings, although members are strongly encouraged to attend as often as possible. **3** This is not part of AA; this group strongly supports total abstinence for life.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** [Ch 1, Groups](#)

**6. 3 Self-help groups are successful because they support a basic human need for acceptance. A feeling of comfort and safety and a sense of belonging may be achieved in a nonjudgmental, supportive, sharing experience with others.**

**1, 2** AA may not meet this need. **4** AA meets dependency needs rather than focusing on independence.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

**Caring; Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Groups](#)

**7. 3 Assimilation involves incorporating the behaviors of a dominant culture.**

**Maintaining eye contact is characteristic of the American culture and not of Asian cultures.**

**1** Prejudice is a negative belief about another person or group and does not characterize this behavior. **2** Stereotyping is the perception that all members of a group are alike. **4** Ethnocentrism is the perception that one's beliefs are better than those of others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

**Communication/Documentation; Nursing Process:** Assessment/Analysis; **Reference:** [Ch 1, Culture and Health](#)

**8. 4 A workshop provides an opportunity to discuss cultural diversity; this should include identification of one's own feelings; also, it provides an opportunity for participants to ask questions.**

**1** Although this will provide information, it does not promote a discussion about the topic. **2** This is not feasible or desirable; clients from other cultures are found in all settings. **3** This probably will increase tension on the unit.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

**Teaching/Learning; Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Culture and Health](#)

**9. 3 Because of a short attention span and distractibility, consistent limit setting is essential toward providing an environment that promotes concentration, prevents confusion, and minimizes conflicts.**

**1** Questions should be answered, but the answers should not be judgmental. **2** A list of expectations may be overwhelming at this age. **4** Parents need to assist children with routine tasks; children this age may not be concerned with time frames.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Individual Factors Affecting Health](#)

**10. 4 Understanding the disorder and the details of care are essential for the client to be self-sufficient.**

**1** Although this is important, a perceived understanding of the need for specific interventions must be expressed before there is a readiness for learning. **2** This is premature; this may be done eventually. **3** Although this is important, involving the college should be the client's decision.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, Teaching-Learning](#)

**11. 2 An individual is held legally responsible for actions committed against another individual or an individual's property.**

**1** This is battery, which involves physical harm. **3** This is the definition of negligence. **4** This is the definition of a crime.

**Client Need:** Management of Care; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**12. 3 Using a stretcher with worn straps is negligent; this oversight does not reflect the actions of a reasonably prudent nurse.**

**1, 4** The nurse is responsible and must ascertain the adequate functioning of equipment. **2** The hospital shares responsibility for safe, functioning equipment.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**13. 3 It is the nurse's responsibility to foresee potential harm and prevent risks by acting as a client advocate.**

**1** This is not acceptable as a rationale for inaction. **2** The nurse and health care provider share interdependent roles in the assessment and care of clients. **4** High temperatures are common in children but are nonetheless a valid cause for concern.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**14. 1 Each state or province protects the health and welfare of its populace by regulating nursing practice.**

**2** Although the members of the profession can also benefit from a clear description of their role, this is not the primary purpose of the law. **3** The employing agency does assume responsibility for its employees and therefore benefits from maintenance of standards, but this is not the purpose of the law. **4** This is too limited; they are just one portion of the population that is protected.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**15. 3 The Nurse Practice Act states that nurses diagnose and treat human responses to actual or potential health problems. Administration of oxygen in an emergency situation is within the scope of nursing practice.**

**1, 2, 4** Because the client's clinical manifestations reflected an immediate need for oxygen, postponement of treatment could have resulted in further deterioration of the client's condition.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**16. 4 The nurse's data collection was not adequate because the nurse did not ask about the date of the previous tetanus inoculation. The nurse failed to support the life and well-being of a client.**

**1** The nurse's assessment was not thorough in regard to determining the date of immunization. **2** It was essential to determine when the client was last immunized; for

a “tetanus-prone” wound, like a puncture from a rusty nail, some form of tetanus immunization usually is given. **3** This is not an independent function of the nurse.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**17. 4 False imprisonment is a wrong committed by one person against another in a willful, intentional way without just cause and/or excuse.**

**1** Negligence is an unintentional tort. **2** Malpractice, which is professional negligence, is classified as an unintentional tort. **3** Breach of duty is an unintentional tort.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**18. 4 Personal liability insurance will represent a nurse before the State Board of Nursing, whereas employee liability insurance will not.**

**1** A nurse can be sued whether or not the nurse has liability insurance. **2** Employer liability insurance will represent the nurse in charges related to employment, not charges brought by the State Board of Nursing. **3** Liability insurance is available for all nurses.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Nurse’s Rights and Responsibilities](#)

**19. 1 Assault is a threat or an attempt to do violence to another, and battery means touching an individual in an offensive manner or actually injuring another person.**

**2** The nurse’s behavior demonstrates anger and does not take into account the growth and developmental needs of children in this age group. **3** Although the behavior (scratching) needs to be decreased, this can be done with mittens, not immobilization. **4** A 3-year-old child does not have the capacity to understand cause (scratching) and effect (bleeding).

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**20. 1 Assault is a threat or an attempt to do violence to another.**

**2** Assault implies harm to persons rather than property. **3** This definition is too broad to describe assault. **4** This is the definition of battery.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**21. 3 Battery means touching in an offensive manner or actually injuring another person.**

**1** Battery refers to actual bodily harm rather than threats of physical or psychologic harm. **2** Battery refers to harm against persons instead of property. **4** This is the definition of negligence.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**22. 2 Legally, a person cannot be locked in a room (isolated) unless there is a threat of danger either to the self or to others.**

**1** Limit setting in this situation is not warranted. This is a reaction to separation from the

parent, which is common at this age. 3 Crying, although irritating, will not harm the other children. 4 A child should never be isolated.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**23. 3 The client's rights have been violated. All clients have the right to a complete and accurate explanation of treatment based on cognitive ability.**

1 All interventions should be explained because they are not routine to the client. 2 When administering treatment, the nurse is responsible for explaining what the treatment is and why it is being given. 4 The Patient Care Partnership (The Patient's Bill of Rights) states that the client should be informed.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Clients' Rights](#)

**24. 4 Informed consent means the client must comprehend the surgery, the alternatives, and the consequences.**

1 This description is not within nursing's domain. 2 Although this is true, it does not determine the client's ability to give informed consent. 3 Although this is true, the nurse should first assess the client's knowledge of the surgery.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Clients' Rights](#)

**25. 4 Although a hysterectomy may be performed, conservative management may include cervical conization and laser treatment that do not preclude future pregnancies; clients have a right to be informed by their health care provider of all treatment options.**

1 This currently is not the issue for this client. 2, 3 This negates the client's feelings.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Clients' Rights](#)

**26. 3 This is considered a routine procedure to meet basic physiologic needs and is covered by a consent signed at the time of admission.**

1 The need for consent is not negated because the procedure is beneficial. 2, 4 This treatment does not require special consent.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Clients' Rights](#)

**27. 4 The client is unconscious. Although the spouse can give consent, there is no legal power to refuse a treatment for the client unless previously authorized to do so by a power of attorney or a health care proxy; the court can make a decision for the client.**

1, 3 This alternative is without legal basis, and the nurse may be held liable. 2 Explanations will not be effective at this time and will not meet the client's needs.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Clients' Rights](#)

**28. 3 Because the client is not certified as incompetent, the right of informed consent is retained.**

**1** The client can sign the consent, but the client's signature requires only one witness. **2, 4** Because there is no evidence of incompetence, the client should sign the consent.  
**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, Clients' Rights](#)

**29. 1 A person is legally unable to sign a consent until the age of 18 years unless the client is an emancipated minor or married. The nurse must determine the legal status of the adolescent.**

**2** Although the adolescent may be capable of intelligent choices, 18 is the legal age of consent unless the client is emancipated or married. **3** Parents or guardians are legally responsible under all circumstances unless the adolescent is an emancipated minor or married. **4** Adolescents have the capacity to choose, but not the legal right in this situation unless they are legally emancipated or married.  
**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, Clients' Rights](#)

► **30. Answer: 1, 2, 3.**

**1** Clients who are mentally competent have the right to refuse treatment; the nurse must respect this right. **2** Client's questions must always be answered truthfully. **3** The health care provider should be notified when a client refuses an intervention so that an alternate treatment plan can be formulated. This is done after the nurse explores the client's reasons for refusal. **4** The client had a discussion with the nurse that indicated that the client had sufficient information to make the decision to refuse the medication. **5** The client has a right to refuse treatment; this right takes precedence over the health care provider's prescription.  
**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Clients' Rights](#)

**31. 4 The nurse should remove and dispose of the patch in a manner that protects self and others from exposure to the fentanyl (Duragesic).**

**1, 2** This is not the responsibility of nonprofessionals because they do not know how to protect themselves and others from exposure to the fentanyl. **3** It is unnecessary to return a used fentanyl patch.  
**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Clients' Rights](#)

► **32. Answer: 1, 2, 4.**

**1** Opioid analgesics can cause respiratory depression; the nurse must monitor respirations. **2** The intensity of pain must be documented before and after administering an analgesic to evaluate its effectiveness. **3** Pruritus is a common side effect that can be managed with antihistamines. It is not an allergic response, so it does not preclude administration. **4** Because of the potential for abuse, the nurse is

legally required to verify an accurate count of doses before taking a dose from the locked source and at the change of the shift. **5** The nurse should not discard an opioid in a client's room. Any waste of an opioid must be witnessed by another nurse.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

**33. 3 This is an invasion of privacy, which is an intentional tort.**

**1, 2, 4** This is an example of professional negligence (malpractice).

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**34. 1 When a client signs herself and her infant out of the hospital, she is legally responsible for her infant.**

**2, 3, 4** The infant is the responsibility of the mother and can leave with the mother when she signs them out.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 2, Clients' Rights](#)

**35. 4 This response is a threat (assault) because the nurse is attempting to put pressure on the client to speak or be left alone.**

**1** This is not a reward and punishment technique that is used in behavior modification therapy. **2, 3** Clients in emotional crisis should not be left alone.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Evaluation/Outcomes; **Reference:** [Ch 2, Torts and Crimes Important to Nurses](#)

**36. 1 The Nurse Practice Act requires nurses to diagnose human responses.**

**2** This is a physical assessment, not a medical diagnosis, and is within the nurse's role. **3** Assessments should not differ when done by the nurse. **4** The nurse is capable of independently performing a physical assessment.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:**

[Ch 2, The Nurse's Rights and Responsibilities](#)

**37. 3 The reporting of possible child abuse is required by law, and the nurse's identity can remain confidential.**

**1** The nurse is functioning in a professional capacity and therefore can be held accountable. **2, 4** Although the Good Samaritan Act protects health professionals, the nurse is still responsible for acting as any reasonably prudent nurse would in a similar situation.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**38. 3 Because the client's condition is terminal, the nursing priority should be directed toward providing basic care and comfort.**

**1, 2, 4** Although these are important aspects of nursing care, provision of comfort is the priority when caring for a dying client.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

**Caring; Nursing Process:** Planning/Implementation; **Reference:** Ch 1, Type of Condition Affecting the Client

**39. 3 Because family members are old enough to understand the client's needs, they should be encouraged to participate in the care.**

**1** Self-care increases oxygen utilization, thereby increasing fatigue and dyspnea. **2** Overworking the client causes undue fatigue; there should be frequent rest periods between different aspects of care. **4** This deprives the client of a support system.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 1, Type of Condition Affecting the Client

**40. 2 Practicing ambulation several hours a day without adequate preparation is not helpful in the rehabilitation process and may exhaust the client; it is essential that the client master specific skills such as maintaining balance, sitting, standing, and stair climbing for safety.**

**1** Because different muscle groups are utilized, the client must be instructed about simple maneuvers; transfer from a sitting to a standing position must be accomplished before ambulation. **3** Balance is essential to prevent falls. **4** The muscles used for crutch walking are different from those used in nonassisted ambulation; therefore, they must be strengthened by active exercises before ambulation.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 2, Teaching-Learning

**41. 2 The nursing process is a step-by-step method that scientifically provides for a client's nursing needs.**

**1, 3, 4** This is only one step in the nursing process.

**Client Need:** Management of Care; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Process

►**42. Answer: 4, 3, 1, 2, 5.**

**4** First the nurse should gather data. **3** Based on the data, the client's needs are assessed. **1** After the needs have been determined, the goals for care are established. **2** The next step is planning care based on the knowledge gained from the previous steps. **5** Implementation follows the development of the plan of care.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Process

**43. 1 An actual or potential client health problem is based on the analysis and interpretation of the data previously collected during the assessment phase of the nursing process.**

**2** Gathering data is included in the client's assessment. **3** Nursing interventions are based on the earlier steps of the nursing process. **4** The plan of care includes nursing actions to meet client needs. The needs must first be identified before nursing actions are planned.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Process

**44. 1 The primary nurse provides or oversees all aspects of care, including assessment, implementation, and evaluation of that care.**

**2** A clinician is an expert teacher or practitioner in the clinical area. **3** The nurse coordinator oversees all the staff and clients on a unit and coordinates care. **4** A clinical nurse specialist is a title given to a nurse specially prepared for one very specific clinical role. It requires a master's degree level of education.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 1, Society and Health

**45. 3 Helping the client to meet physical needs is within the role of the nurse; arranging blankets on the client's bed is an appropriate intervention.**

**1** The nurse's comfort needs should not take precedence over the client's needs; the nurse should not assume responsibility for the role of care provider if incapable of providing care. **2** It is not a good deed but fulfills the expected role of the nurse; this response sounds grudgingly compliant. **4** This is within the nurse's job description.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, The Nurse-Client Relationship

**46. 4 When the implementation of a plan of care does not effectively produce the desired outcome, the plan should be changed.**

**1** Time is not relevant in the revision of a plan of care. **2** Client response to care is the determining factor, not the validity of the health problem. **3** Various methods may have the same outcome; their effectiveness is most important.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 2, Nursing Process

▶**47. Answer: 1, 4.**

**1** Acquiring knowledge or understanding aids in developing concepts, rather than skills or attitudes, and is a basic learning task in the cognitive domain. **2** Values and self-realization are in the affective domain. **3** Skills acquisition is in the psychomotor domain. **4** Acquiring knowledge or understanding aids in developing concepts rather than skills or attitudes and is a basic learning task in the cognitive domain. **5** Skills acquisition is in the psychomotor domain.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 2, Teaching-Learning

**48. 3 Success is a basic motivation for learning. People receive satisfaction when a goal is reached.**

**1** Progress toward long-range goals is often not readily apparent and may be discouraging. **2** Constructive criticism is an important aspect of client teaching, but if it is not tempered with praise, it is discouraging. **4** This is an important part of teaching, but it probably will not motivate the client.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Teaching-Learning](#)

49. 3 A paradoxical response to a drug is directly opposite the desired therapeutic response.

1 An allergic response is an antigen-antibody reaction. 2 A synergistic response involves drug combinations that enhance each other. 4 This is a response to a drug that is more pronounced than the common response.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Medication Administration, Drug Effects](#)

50. 3 Hypersensitivity results from the production of antibodies in response to exposure to certain foreign substances (allergens). Earlier exposure is necessary for the development of these antibodies.

1 This is not a sensitivity reaction to penicillin; hay fever and asthma are atopic conditions. 2 It is an active, not passive, immune response. 4 Antibodies developed when there was a prior, not current, exposure to penicillin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Medication Administration, Drug Effects](#)

51. 2 Legally, a nurse cannot administer medications without a prescription from a legally licensed individual.

1 The nurse cannot give the medication without a current health care provider's prescription; this is a dependent function of the nurse. 3 The nurse should not ask if the health care provider is aware of the problem; it is the nurse's responsibility to document the client's health history. 4 It is the nurse's responsibility to review the health care provider's orders and question them when appropriate

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

►52. **Answer: 1 mL.** When 132 pounds is converted to kilograms, it equals 60 kg.

The practitioner prescribed 5 mcg/kg; therefore,  $5 \times 60 = 300$  mcg. This desired amount is contained in 1 mL, as indicated on the vial label.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

►53. **Answer: 2.4 mL.** Use the "Desire over Have" formula to solve this problem.

$$\text{Desire } 60 \text{ mg} = x \text{ mL}$$

Have 125 mg 5 mL

$$125x = 300$$

$$x = 300 \div 125 = 2.4 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

►54. **Answer: 1.5 mL.** Use the “Desire over Have” formula to solve the problem.

Desire 375 mg = x mL

Have 250 1 mL

$$250x = 375$$

$$x = 375 \div 250$$

$$x = 1.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

55. **2 The wasting of controlled substances should be witnessed by two licensed personnel according to federal regulations; this can be done by an RN or LPN.**

**1** Although the nursing supervisor is licensed and may perform this function, it is not an efficient use of this individual’s expertise. **3** Federal regulations do not require the participation by the client’s health care provider in this situation. **4** A nursing assistant is not a licensed person who can take responsibility for the wasting of controlled substances.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

56. 4 The vaccination is scratched into the skin using a bifurcated needle.

1 An intramuscular injection using the Z-track technique will administer the vaccine too deep. 2 An intravenous injection is unsafe and ineffective. 3 A subcutaneous injection will administer the vaccine too deep.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

57. Use the "Desire over Have" formula of ratio and proportion to solve this problem.

$$\text{Desire } 125 \text{ mg} = x \text{ mL}$$

$$\text{Have } 225 \text{ mg } 1 \text{ mL}$$

$$225x = 125$$

$$x = 125 \div 225$$

$x = 0.55 \text{ mL}$ . Round the answer up to 0.6 mL.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

58. 3 When an oral medication is available in a suspension form, the nurse can use it for clients who cannot swallow capsules. Use the "Desire over Have" formula to solve the problem.

$$\text{Desire } 100 \text{ mg} = x \text{ mL}$$

$$\text{Have } 125 \text{ mg } 5 \text{ mL}$$

$$125x = 500$$

$$x = 500 \div 125$$

$$x = 4 \text{ mL}$$

**1** Because a palatable suspension is available, it is a better alternative than opening the capsule. **2** The route of administration cannot be altered without the health care provider's approval. **4** Intramuscular injections should be avoided because of risks for tissue injury and infection.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

►59. Answer: **2, 3, 6.**

**1** NSAIDs do not cause diuresis; reversible renal ischemia and renal insufficiency in clients with heart failure, cirrhosis, or hypovolemia can be potential adverse effects of NSAIDs. **2** Prostaglandins accumulate at the site of an injury, causing pain; NSAIDs inhibit COX-1 and COX-2 (both are isoforms of the enzyme cyclooxygenase), which inhibit the production of prostaglandins, thereby contributing to analgesia. **3** NSAIDs inhibit COX-2, which is associated with fever, thereby causing antipyresis. **4** NSAIDs do not cause bronchodilation. **5** This is an adverse effect, not a desired outcome; NSAIDs can impair platelet function by inhibiting thromboxane, an aggregating agent, resulting in bleeding. **6** NSAIDs inhibit COX-2, which is associated with inflammation, thereby reducing inflammation.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Nonsteroidal Antiinflammatory Drugs \(NSAIDs\)](#)

**60. 2 Paraphrasing encourages the client to express the rationale for this request.**

**1** This is making an assumption without enough information. **3** This statement may increase the client's anxiety. **4** Although this request should be forwarded to the health care provider, the reason for the choice of general anesthesia should be explored.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**61. 1 Past experiences have the most meaningful influence on present learning.**

- 2, 3, 4 Although this is a consideration that affects learning, its influence is not as great as past experiences.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, Teaching-Learning](#)
62. **3 In the initial stage of grief the degree of anguish experienced is influenced by cultural background.**  
 1 Although these factors enter into the grief process, they are not as important as culture. 2 This is not directly related to a grief response. 4 While past experience is important, it is not as significant as culture.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 1, Culture and Health](#)
63. **1 Without some form of communication there can be no socialization.**  
 2, 3, 4 People interact with other social beings, not with inanimate objects.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, Communication](#); [Basic Concepts](#)
64. **1 Feedback permits the client to ask questions and express feelings and allows the nurse to verify client understanding.**  
 2 Medical assessments do not always include nurse-client relationships. 3 Team conferences are subject to all members' evaluations of a client's status. 4 Nurse-client communication should be evaluated by the client's verbal and behavioral responses.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, Communication](#); [Basic Concepts](#)
65. **1 When nurses make judgmental remarks and client needs are not placed first, the standards of care are violated and quality of care is compromised.**  
 2 Assessments should be objective, not subjective and biased. 3 There is no information about the client's acuity to come to this conclusion. 4 The statement does not reflect information about complexity of care.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse-Client Relationship](#)
66. **3 Relaxation of muscles and facial expression are examples of nonverbal behavior; nonverbal behavior is an excellent index of feelings because it is less likely to be consciously controlled.**  
 1 Increased activity may be an expression of anger or hostility. 2 Clients may suppress verbal outbursts despite feelings and become withdrawn. 4 Refusing to talk may be a sign that the client is just not ready to discuss feelings.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse-Client Relationship](#)
67. Answer: 1, 3, 5.

**1** Taking routine vital signs is a universal activity that all nursing assistants (NAs) are taught to perform regardless of the setting; it is within the job description for NAs. **2** NAs do not have the expertise or credentials to apply sterile dressings. **3** Answering call lights is a universal activity that all NAs are taught to perform regardless of the setting; it is within the job description for NAs. **4** NAs do not have the expertise or credentials to administer intravenous solutions. **5** Making an occupied bed is a universal activity that all NAs are taught to perform regardless of the setting; it is within the job description for NAs. **6** NAs do not have the expertise or credentials to document clients' responses.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Leadership and Management, Principles of Leadership](#)

**68. 1 Sitting quietly with the client conveys the message that the nurse cares and accepts the client's feelings; this helps to establish trust.**

**2** This is negating feelings and the client's right to cry when upset. **3** Distraction closes the door on further communication of feelings. **4** After a trusting relationship has been established, the nurse can help the client explore the problem in more depth.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**69. 3 An honest nurse-client relationship should be maintained so that trust can develop.**

**1, 2** Although other health care team members may need to be informed eventually, the initial action should involve only the nurse and client. **4** This does not promote trust or communication between the client and nurse.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**70. 1 The cause of the alarm should be investigated and appropriate intervention instituted; after the client's needs are met, then other tasks can be performed.**

**2** An alarm should never be ignored; the client's status takes priority over the change-of-shift report. **3** The diastolic pressure limit has been ordered by the health care provider and should not be changed for the convenience of the nurse. **4** Alarms should always remain on; the alarm indicates that the client's blood pressure has decreased and immediate assessment is required.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Process](#)

**71. 3 This addresses the fact that the client's feelings of anxiety are valid.**

**1, 2** This does not address the client's concerns and may inhibit the expression of feelings. **4** This is irrelevant and does not address the client's concerns.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**72. 1 Orienting the client to the hospital unit provides knowledge that may reduce the**

**strangeness of the environment.**

**2** This is part of orienting the client to the unit. This alone is not enough when orienting a client to the hospital. **3** This may be false reassurance, because no one can guarantee that there is no reason to be concerned. **4** This implies that staff members are available only if the client has specific questions.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, The Nurse-Client Relationship](#)

**73. 2 Because of the variety of factors vying for the nurse's time, efficient use of the time available for teaching is essential to meet the standards of care and legal responsibilities of the nurse.**

**1** The increased awareness and knowledge of health issues by consumers may provide a foundation on which the teaching plan may be built; informed consumerism should be viewed as positive, not negative. **3** Assessing cultural beliefs is part of the initial and continuing assessment of clients; this should not cause additional stress when teaching. **4** Generally, adults are motivated, independent learners, and the nurse teacher should be a facilitator of learning.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;  
**Reference:** [Ch 2, Teaching-Learning](#)

**74. 1 The client has the right to make this decision, and the staff should accept the client's wishes.**

**2** The client is a doctor, and the nurse's statement attacks the client's self-concept. **3** The informality of using first names is not encouraged unless it is the client's choice. **4** The nurse can and should honor the client's request.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, The Nurse-Client Relationship](#)

**75. 3 This response attempts to open the communication process.**

**1** Reflecting the words, not the feelings, serves to entrench the communicant's position and does little to open the flow of communication. **2** This shifts the focus away from the client. **4** This is authoritative and closes the flow of communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** [Ch 2, The Nurse-Client Relationship](#)

**76. Answer: 1, 4.**

**1** Performing a bed bath for a client on bed rest is within the scope of practice of a nursing assistant (NA). **2** Evaluating human responses to medications requires the expertise of a licensed professional nurse. **3** This activity requires a professional nursing judgment to determine whether or not the medication should be administered. **4** This activity does not require professional nursing judgment and is within the job description of NAs. **5** Evaluating human responses to health care interventions requires the expertise of a licensed professional nurse.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Leadership and Management, Principles of Leadership](#)

**77. 2 The nurse has demonstrate recognition of the verbalized concern and a willingness to listen.**

**1** The client did not state this as the diagnosis; this response puts the client on the defensive. **3** Avoiding the question indicates that the nurse is unwilling to listen. **4** This cuts off communication and denies feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**78. 1 The first step in the problem-solving process is data collection so that client needs can be identified. During the initial interview a direct approach obtains specific information such as allergies, current medications, and health history.**

**2** This approach is too broad because in a nondirective interview the client controls the subject matter. **4** This is premature at the initial visit.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**79. 3 These guidelines govern safe nursing practice; nurses are legally responsible to perform according to these guidelines.**

**1** This explains what the public can expect from nurses, but it is not used to govern nursing practice. **2, 4** There are no data that indicate this information is necessary.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**80. 1 Privacy may provide an environment that is conducive to the client sharing information about the situation. The client needs to be kept safe; this action ensures additional time for assessment to rule out the possibility of abuse.**

**2** This is premature; further assessment is needed to determine if it is necessary to notify the appropriate agency. **3** This will form a separate relationship with the adult child, which is not in the client's best interest. **4** This is inappropriate; this situation presents a legal, not ethical, issue.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**81. Answer: 1, 2, 4.**

**1** Eye contact indicates to the client that the nurse is listening and interested. **2** Paraphrasing is an effective interviewing technique; it indicates to the client that the message was heard and invites the client to elaborate further. **3** This can be threatening to the client, who may not have the answer to these questions. **4** Open-ended statements provide a milieu in which people can verbalize their problems rather than be placed in a situation of providing a forced response. **5** False reassurance is detrimental to the nurse-client relationship and does not promote

communication. **6** Direct questions do not open or promote communication.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 2, The Nurse-Client Relationship](#)

**82. 2 Nurses must identify their own feelings and prejudices because these may affect the ability to provide objective, nonjudgmental nursing care.**

**1** Exploring a client's emotional well-being can be accomplished only after the nurse works through one's own feelings. **3** The focus should be on the client, not the family. **4** Health team members should work together for the benefit of all clients, not just this client.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, The Nurse-Client](#)

[Relationship](#)

**83. 2 Hypersensitivity can produce an anaphylactic reaction with edema of the respiratory system, resulting in respiratory obstruction, respiratory arrest, and asphyxia.**

**1** This is unrelated to anaphylaxis. **3** This is associated with excessive exercise. **4** In an anaphylactic reaction the blood pressure decreases, not increases.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** [Ch 2, Medication Administration, Drug Effects](#)

► **84. Answer: 2, 3.**

**1** Personal protective equipment (PPE) is not required because the nurse is not in contact with body secretions. **2** PPE should be used because the newborn is covered with amniotic fluid and maternal blood. **3** PPE should be used because the nurse may be exposed to blood and fluid that are contained in the portable wound drainage system. **4** PPE is not necessary when conducting an interview because it is unlikely that the nurse will come in contact with the client's body fluids. **5** PPE is not necessary when obtaining the blood pressure of a client, even if the client is HIV positive.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients at Risk for Infection, Table 3-1 Precautions to Prevent the Spread of Microorganisms](#)

**85. 4 Agency policy determines procedures; if the procedure is out of date or problematic, the nurse should contact the health care provider for a change in the order.**

**1, 3** The nurse cannot use another product without a health care provider's order. **2** The nurse will be risking liability if agency policy is not followed unless the order is changed by the health care provider.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

► **86. Answer: 4, 2, 3, 1, 5.**

**4** The first action should be to remove the victim from the source of further injury. **2** After further injury is avoided, reestablishing breathing becomes the priority. **3** Applying pressure to stop the bleeding becomes the priority after breathing has been reestablished. **1** The next step is to objectively evaluate the victim's responses to the crisis and the care. **5** Transportation to the hospital can occur after the client has

been physically stabilized.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Emergency Situations, Concepts Related to First Aid](#)

**87. 2 The goal in a disaster, when need exceeds resources, is to benefit the largest number of people; helping those who need less care first benefits the largest number because they become available to help others.**

**1, 3, 4 This is not the priority in a disaster.**

**Client Need:** Safety and Infection Control; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Emergency Situations, Concepts Related to First Aid](#)

**88. 4 Studies have demonstrated that people from China, Greece, and Ethiopia view honesty about diagnosis and prognosis as heartless, unnecessary, and even harmful to the client; usually family members from these cultures decide what is most appropriate to share with the client.**

**1, 2 This information is not relevant when caring for a dying client. 3 Based on the client's culture, this question should not be asked because the family will be making the decision about what medical information the client should be given.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Concepts from Sociology](#)

**89. 4 The nurse's presence communicates concern and provides an opportunity for the client to initiate communication; silence is an effective interpersonal technique that permits the client to direct the content and extent of verbalizations without the nurse imposing on the client's privacy.**

**1 Crying, part of depression, usually ceases when the individual reaches acceptance. 2 During acceptance the client may decide not to have visitors, preferring time for reflection. 3 Detached from the environment, the client may find that the details of various procedures lose significance.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Grieving Process](#)

**90. 4 Seeking other opinions to disprove the inevitable is a form of denial employed by individuals having illnesses with a poor prognosis.**

**1 If the client is crying, the client is aware of the magnitude of the situation and is past the stage of denial. 2 Criticism that is unjust is often characteristic of the stage of anger. 3 This is most common during the depression experienced as one moves toward acceptance or during the acceptance stage.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 1, Grieving Process](#)

**91. 1 Bargaining is one of the stages of grieving, in which the client promises some type of desirable behavior to postpone the inevitability of death.**

**2 Frustration is a subjective experience, a feeling of being thwarted, but it is not one of the stages of grieving. 3 Classified as the fourth stage of grieving, depression**

represents the grief experienced as the individual recognizes the inescapability of fate. 4 Rationalization is a defense mechanism in which attempts are made to justify or explain an unacceptable action or feeling; it is not a stage of the grieving process.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 1, Grieving Process](#)

**92. 2 Detachment is a coping mechanism that the client needs, especially when faced with the inevitability of death; the nurse should accept this behavior.**

1 Ignoring the behavior does not convey a willingness to listen and denies the client's feelings. 3 The client is in acceptance. It is unnecessary to point out the reality of the situation. 4 It is counterproductive to encourage the client to become involved with the environment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 1, Grieving Process](#)

**93. 3 This is truthful and provides basic information that may prompt recollection of what occurred; it is a starting point.**

1 This ignores the client's question; avoidance may increase anxiety. 2 This ignores the client's question; the frustration of trying to remember will increase anxiety. 4 This is too blunt for the initial response to the client's question; the client may not be ready to hear this at this time.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Communication/Documentation;** **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**94. 2 This response demonstrates that the nurse cares about the client and will have time for the client's special emotional needs. This approach allays anxiety and reduces emotional stress.**

1 This indicates that the nurse's other tasks are more important than the client's needs. 3 This is false reassurance and not therapeutic. 4 This does not respond to the client's need and cuts off communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Communication/Documentation;** **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**95. 1 At this time the client is using this behavior as a defense mechanism. Acceptance can be an effective interpersonal technique, since it is nonjudgmental. Eventually, limits may need to be set to address the behavior if it becomes more aggressive or hostile.**

2 During periods of overt hostility, perceptions are altered, making it difficult for the client to evaluate the situation rationally. 3 Withdrawal signifies nonacceptance and rejection. 4 The staff may be the target of a broad array of emotions; by focusing on only behaviors that affect the staff, the full scope of the client's feelings are not considered.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**96. 3 This response promotes an exploration of the client's dilemma; it encourages**

**further communication.**

**1** Although this is true, this response is not supportive and abandons the client. **2, 4** It is inappropriate for the nurse to give advice.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**97. 2 Communication is important in relieving anxiety and reducing stress.**

**1** This does not acknowledge the client's feelings and does not address the source of the anxiety. **3** Learning is limited when anxiety is too high. **4** The focus should be on the client, not others. Reassurance may cut off communication and deny emotions.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**98. 3 Because of the profound effect of paralysis on body image, the nurse should foster an environment that permits exploration of feelings without judgment, punishment, or rejection.**

**1** Attempts to distract the client may be interpreted as denial of the client's feelings and will not resolve the underlying problem. **2, 4** This is an important part of nursing care, but it is not related to the client's feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**99. 2 The nurse should identify clues to a client's anxiety and encourage verbalization of feelings.**

**1, 4** This response negates the client's feelings and presents a negative connotation. **3** This response focuses on the task rather than on the client's feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

**100. 4 This question may validate the client's understanding; the response may indicate the need for further teaching or that the client understands; understanding and accepting the need for restrictions will increase adherence to the diet.**

**1** Assessing the client's food preferences and teaching about diets follow an assessment of the client's understanding about the need for a specific diet; the client must understand the need for and the benefits of the diet before there is a readiness for learning. **2, 3** This is an authoritarian approach that should be avoided.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, Teaching-Learning](#)

**101. 1 The nurse should assess the situation before planning an intervention.**

**2** This minimizes concerns and cuts off communication. **3** This is premature; more information is needed. **4** The nurse needs more information; pulling the curtain may make the client feel isolated, which may increase anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 2, Nursing Process](#)

102. **1 This statement is open-ended and encourages the client to verbalize concerns.**

**2, 4** This cuts off communication. **3** Nothing in the situation indicates that surgery is planned; this response may increase anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Communication/Documentation;** **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse-Client Relationship](#)

103. **4 A portable wound drainage system has negative pressure; a nurse must ensure that the collection chamber is compressed so that fluid flows down the pressure gradient from the client to the collection device.**

**1** This is Newton's law of gravity, which is not the physical principle underlying the functioning of a portable wound drainage system. **2, 3** Although true, this is not what causes the fluid to drain in a portable wound drainage system

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

104. **4 Release of adrenocortical steroids (cortisol) by the stress of surgery causes renal retention of sodium and excretion of potassium.**

**1** Although sodium may be depleted by nasogastric suction, retention by the kidneys generally balances this loss. **2, 3** This is not depleted by surgery or urinary excretion.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Acid-Base Balance](#)

►105. Answer: **1, 2, 6.**

**1** Clean gloves should be worn to check the IV site because there is a risk of coming into contact with the client's blood. **2** Ensuring that the medication is mixed is important. Rotating the bag is one way, although there are others. **3** The amount and type of solution depend on the medication. **4** The needle does not have to be changed if sterility is maintained. **5** The IVPB should be hung higher, not lower, than the existing bag. **6** Because IV solutions enter the body's internal environment, all solutions and medications using this route must be sterile to prevent the introduction of microbes.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

106. **3 Hypotonic solutions are less concentrated (contain less than 0.85 g of sodium chloride in each 100 mL) than body fluids.**

**1** Isotonic solutions are those that cause no change in the cellular volume or pressure, because their concentration is equivalent to that of body fluid. **2** This relates to two compounds that possess the same molecular formula but that differ in their properties or in the position of atoms in the molecules (isomers). **4** Hypertonic solutions contain more than 0.85 g of solute in each 100 mL.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Fluid and Electrolyte](#)

## Balance

**107. 2 Because of fluid overload in the intravascular space, the neck veins become visibly distended.**

**1, 3** This occurs with a fluid deficit. **4** If sodium causes fluid retention, its concentration is unchanged; if fluid is retained independently of sodium, its concentration is decreased.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**108. 2 Skin elasticity will decrease because of a decrease in interstitial fluid.**

**1** The pulse rate will increase to oxygenate the body's cells. **3** Specific gravity will increase because of the greater concentration of waste particles in the decreased amount of urine. **4** The temperature will increase, not decrease.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**109. 2 Dehydration is most readily and accurately measured by serial assessments of body weight; 1 L of fluid weighs 2.2 lb.**

**1** Although dry skin may be associated with dehydration, it also is associated with aging and some disorders (e.g., hypothyroidism). **3** Although hypovolemia will eventually result in a decrease in blood pressure, it is not an accurate, reliable measure because there are many other causes of hypotension. **4** This is too general and not an objective determination of fluid volume deficit.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**110. 3 Increased respirations blow off carbon dioxide (CO<sub>2</sub>), which decreases the hydrogen ion concentration and the pH increases (less acidity). Decreased respirations result in CO<sub>2</sub> buildup, which increases hydrogen ion concentration and the pH falls (more acidity). The kidneys either conserve or excrete bicarbonate and hydrogen ions, which helps to adjust the body's pH. The buffering capacity of the renal system is greater than that of the pulmonary system, but the pulmonary system is quicker to respond.**

**1, 4** These systems do not maintain the pH. **2** Although the circulatory system carries fluids and electrolytes to the kidneys, it does not interact with the urinary system to regulate plasma pH.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**111. 1 Blood plasma and interstitial fluid are both part of the extracellular fluid and are of the same ionic composition.**

**2** The osmotic pressure is the same. **3** The composition is the same. **4** The main cation of both extracellular fluids is sodium.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**112. 2 Interstitial fluid constitutes about 16% of body weight, which is 10 to 12 L in an**

**adult male of 68 kg (150 lb).**

**1** Plasma is 4% of body weight. **3** Dense tissue is part of the intracellular component. **4** Body secretions are derived from extracellular fluid and are calculated as part of the 20% of the total body weight.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**113. 4 The concentration of potassium is greater inside the cell and is important in establishing a membrane potential, a critical factor in the cell's ability to function.**

**1** Sodium is the most abundant cation of the extracellular compartment, not the intracellular compartment. **2** Calcium is the most abundant electrolyte in the body; 99% is concentrated in the teeth and bones, and only 1% is available for bodily functions. **3** Chloride is an extracellular, not intracellular, anion.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**114. 2 The excreted ammonia combines with hydrogen ions in the glomerular filtrate to form ammonium ions, which are excreted from the body. This mechanism helps rid the body of excess hydrogen, maintaining acid-base balance.**

**1, 4** This is not affected by excretion of ammonia. **3** Ammonia is formed by the decomposition of bacteria in the urine; ammonia excretion is not related to the process and does not control bacterial levels.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**115. 1 Excess fluid can move into the lungs, causing crackles; clear breath sounds support that treatment was effective.**

**2** While it may make palpation more difficult, excess fluid will not diminish pedal pulses. **3** A normal potassium level can be maintained independently of fluid excess correction. **4** As the client excretes excess fluid, the urine specific gravity will decrease, not increase.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Acid-Base Balance](#)

**116. 4 Because the plasma colloidal oncotic pressure (COP) is the major force drawing fluid from the interstitial spaces back into the capillaries, a drop in COP caused by albuminuria results in edema.**

**1** Hydrostatic tissue pressure is unaffected by alteration of protein levels; colloidal pressure is affected. **2** Hydrostatic pressure is influenced by the volume of fluid and the diameter of the blood vessel, not directly by the presence of albumin. **3** The osmotic pressure of tissues is unchanged.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**117. 4 Albumin is hypertonic and will draw additional fluid from the tissues into the intravascular space.**

**1** This will absorb the watery diarrhea, giving more bulk to the stool. **2** This is appropriate because diarrhea causes potassium loss. **3** This is a hypotonic solution,

which can correct dehydration.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 3, Acid-Base Balance

**118. 2 Sodium bicarbonate is a base and one of the major buffers in the body.**

**1** Potassium, a cation, is not a buffer; only a base can buffer an acid. **3** Carbon dioxide is carried in aqueous solution as carbonic acid ( $\text{H}_2\text{CO}_3$ ); an acid does not buffer another acid. **4** Sodium chloride is not a buffer; it is a salt.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 3, Acid-Base Balance

**119. 3 Gastric lavage causes an excessive loss of gastric fluid, resulting in excessive loss of hydrochloric acid (HCL) that can lead to alkalosis; the HCL is not available to neutralize the sodium bicarbonate ( $\text{NaHCO}_3$ ) secreted into the duodenum by the pancreas. The intestinal tract absorbs the excess bicarbonate, and alkalosis results.**

**1** Gastric lavage will lead to alkalosis, which is associated with increased pH. **2** Gastric lavage will not affect oxygen levels. **4** Gastric lavage may lead to dehydration, which will increase osmotic pressure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 3, Acid-Base Balance

**120. 1 The pH of blood is maintained within the narrow range of 7.35 to 7.45. When there is an increase in hydrogen ions, the respiratory, buffer, and renal systems attempt to compensate to maintain the pH. If compensation is not successful, acidosis results and is reflected in a lower pH.**

**2, 3** This is within the acceptable range for pH. **4** This is slightly alkaline.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

**Assessment/Analysis; Reference:** Ch 3, Acid-Base Balance

**121. 3 One of the kidneys' functions is to eliminate potassium from the body; diseases of the kidneys often interfere with this function, and hyperkalemia may develop, necessitating dialysis.**

**1** Clients with Crohn disease have diarrhea, resulting in potassium loss. **2** Clients with Cushing disease will retain sodium and excrete potassium. **4** Clients with gastroesophageal reflux disease are prone to vomiting that may lead to sodium and chloride loss with minimal loss of potassium.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

**Assessment/Analysis; Reference:** Ch 3, Acid-Base Balance

**122. 2 Vital signs monitor cardiorespiratory status; hyperkalemia causes cardiac dysrhythmias. The health care provider should be notified because medical intervention may be necessary.**

**1** A repeat laboratory test will take time and probably reaffirm the original results; the client needs immediate attention. **3** The cardiac arrest team is always on alert and will respond when called for a cardiac arrest. **4** These are insufficient interventions.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

**Planning/Implementation; Reference:** Ch 3, Acid-Base Balance

►**123. Answer: 3, 4, 5.**

**1** Tetany is caused by hypocalcemia. **2** Seizures caused by electrolyte imbalances are associated with low calcium or sodium levels. **3** Because of potassium's role in the sodium/potassium pump, hyperkalemia will cause diarrhea. **4** Because of potassium's role in the sodium/potassium pump, hyperkalemia will cause weakness. **5** Because of potassium's role in the sodium/potassium pump, hyperkalemia will cause cardiac dysrhythmias.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

**124. 3 Once treatment with insulin for diabetic ketoacidosis is begun, potassium ions reenter the cell, causing hypokalemia; therefore, potassium, along with the replacement fluids, is needed.**

**1** Potassium will not correct hyperpnea. **2** Flaccid paralysis does not occur in diabetic ketoacidosis. **4** Considering the relationship between insulin and potassium, treatment with KCl is prophylactic, preventing the development of dysrhythmias.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**125. Answer: 495 mL.** Intake includes 350 mL of IV fluid, 600 mL of NGT feeding, and 150 mL of water via NGT, for a total intake of 1100 mL; output includes voidings of 150, 220, and 235 mL, for a total output of 605 mL. Subtract 605 mL from 1100 mL for a difference of 495 mL.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**126. 3 The liver manufactures albumin, the major plasma protein. A deficit of this protein lowers the osmotic (oncotic) pressure in the intravascular space, leading to a fluid shift.**

**1** An enlarged liver compresses the portal system, causing increased, rather than decreased, pressure. **2** The kidneys are not the primary source of the pathologic condition. It is the liver's ability to manufacture albumin that maintains the colloid oncotic pressure. **4** Potassium is not produced by the body, nor is its major function the maintenance of fluid balance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Fluid and Electrolyte Balance](#)

**127. 2 An infusion of dextrose in water does not provide proteins required for tissue growth, repair, and maintenance; therefore, tissue breakdown occurs to supply the essential amino acids.**

**1** Each liter provides approximately 170 calories, which is insufficient to meet minimal energy requirements; tissue breakdown will result. **3** Weight loss is caused by insufficient nutrient intake; vitamins do not prevent weight loss. **4** An infusion of 5% dextrose in water may decrease electrolyte concentration.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and](#)

## Electrolyte Problems

►128. **Answer: 31 drops per minute.** Use the following formula to solve the problem.

$$\text{Drops per minute} = \frac{\text{total volume in drops}}{\text{total time in minutes (hours} \times 60)} \times (\text{total mL} \times \text{drop factor})$$

$$\begin{aligned}\text{Drops per minute} &= \frac{1000 \text{ mL} \times 15}{8 \times 60} = \frac{15,000}{480} = 31.25 \\ &= 31 \text{ gtts/min}\end{aligned}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

129. **2 Hyperventilation causes excessive loss of carbon dioxide, leading to carbonic acid deficit and respiratory alkalosis.**

**1** Cardiac arrest is unlikely; the client may experience dysrhythmias but will lose consciousness and begin breathing regularly. **3** Hyperventilation causes alkalosis; the pH is increased. **4** This cannot occur; the usual oxygen saturation of hemoglobin is 95% to 98%.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Acid-Base Balance](#)

►130. **Answer: 950 mL.**

The client received 150 mL from the first bag, 200 mL from IVPBs, and 600 mL from the current bag. The sum of these volumes is 950 mL.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients With Fluid and Electrolyte Problems](#)

131. **1 A low pH and low bicarbonate level are consistent with metabolic acidosis.**

**2, 4** The pH indicates acidosis. **3** The CO<sub>2</sub> concentration is within normal limits, which is inconsistent with respiratory acidosis; it is elevated with respiratory acidosis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Acid-Base Balance](#)

132. **4 The high pH and low carbon dioxide level are consistent with respiratory alkalosis, which can be caused by mechanical ventilation that is too aggressive.**

**1** Airway obstruction causes carbon dioxide buildup, which leads to respiratory acidosis. **2** Inadequate nutrition causes excess ketones, which can lead to metabolic acidosis. **3** Prolonged gastric suction causes loss of hydrochloric acid, which can lead to metabolic alkalosis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Acid-Base Balance](#)

**133. 2 When albumin is administered slowly and oral fluid intake is restricted, fluid moves from the interstitial spaces into the circulatory system so it can be eliminated by the kidneys. Administration should not exceed 5 to 10 mL/min.**

**1** Oral fluids are restricted to facilitate the optimal effects of the albumin, which shifts fluids from the interstitial spaces to the intravascular compartment. **3** Rapid administration may cause circulatory overload; fluid is restricted, not withheld. **4** Rapid administration may cause circulatory overload; unrestricted fluid intake will limit the shift of fluid from the interstitial to the intravascular compartment, interfering with the optimal effects of the albumin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**134. 4 Serum albumin, a protein, establishes the plasma colloid osmotic (oncotic) pressure because of its high molecular weight and size.**

**1** Blood clotting involves blood protein fractions other than albumin; for example, prothrombin and fibrinogen are within the alpha- and beta-globulin fractions. **2** Red blood cell formation (erythropoiesis) occurs in red marrow and can be related to albumin only indirectly; albumin is the blood transport protein for thyroxine, which stimulates metabolism in all cells, including those in red bone marrow. **3** Albumin does not activate white blood cells; WBCs are activated by antigens and substances released from damaged or diseased cells.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Fluid and Electrolyte Balance](#)

**135. 4 After 24 hours there is increased risk for contamination of the solution and the bag should be changed.**

**1, 2, 3** It is unnecessary to change the bag this often.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**136. 2 Infiltration is caused by catheter displacement, allowing fluid to leak into the tissues.**

**1** This will affect the flow rate, not cause infiltration. **3** This can lead to infection and phlebitis, not infiltration. **4** This can lead to phlebitis, not infiltration.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

►**137. Answer: 2, 3, 4.**

**1** Heat is associated with phlebitis; the accumulation of room temperature IV fluid in the tissue makes the site feel cool. **2** The accumulation of fluid in the tissues between the surface of the skin and the blood vessels makes the skin appear pale. **3** The

accumulation of fluid in the interstitial compartment causes swelling. **4** As the needle/catheter is dislodged from the vein, the drip rate of the IV slows or ceases. **5** This is a sign of circulatory overload; when an IV infusion has infiltrated, the intravascular fluid volume does not increase.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**138. 2 When an IV infusion infiltrates, it should be removed to prevent edema and pain.**

**1** Elevation does not change the position of the IV cannula; the infusion must be discontinued. **3** This will add to the infiltration of fluid. **4** Soaks may be applied, if ordered, after the IV cannula is removed.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**139. Answer: 167 mL/hr.** Electronic infusion control devices require a nurse to set the rate (mL/hr) and volume to be infused. Solve the problem by dividing the total milliliters to be infused by the number of hours of the infusion.  $2000 \div 12 = 166.66$ . Most agencies will round this to a whole number (167), but some devices can be set to the nearest tenth (166.7), so the nurse should check agency policy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**140. 1 Hypokalemia causes a flattening of the T wave on an electrocardiogram, as observed on the monitor, because of its effect on muscle function.**

**2** Hypokalemia causes a depression of the ST segment. **3** Hypokalemia causes a widening of the QRS complex. **4** Hypokalemia does not cause a deflection of the Q wave.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Fluid and Electrolyte Balance](#)

**141. 1 Potassium follows insulin into the cells of the body, thereby raising the intracellular potassium level and preventing fatal dysrhythmias.**

**2** Insulin does not cause excretion of these substances. **3** Potassium is not excreted as a result of this therapy; it shifts into the intracellular compartment. **4** The potassium level has no effect on pancreatic insulin production.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

**142. 4 Hypokalemia diminishes the magnitude of the neuronal and muscle cell resting potentials. Abdominal distention results from flaccidity of intestinal and abdominal musculature.**

**1** Edema is a sign of sodium excess. **2** Muscle spasms are a sign of hypocalcemia. **3** Kussmaul breathing is a sign of metabolic acidosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Fluid and Electrolyte Balance](#)

▶143. **Answer: 38 drops per minute.** Solve the problem by using the following formula:

$$\text{Drops per minute} = \frac{\text{total number of drops}}{\text{total time in minutes}}$$

$$\text{Drops per minute} = \frac{50 \text{ mL} \times 15 \text{ (drop factor)}}{20 \text{ minutes}} = \frac{750}{20} = 37.5$$

Round the answer to 38 drops per minute.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Fluid and Electrolyte Problems](#)

144. **1 Clients and their families need to maintain honest, open interpersonal communication so that concerns can be shared and future problems addressed.**

**2** While an understanding of the disease is important, details will not assist the significant other in maintaining an active, caring role. **3** The spouse may want to know this, but it will not help meet the needs of both the spouse and the client. **4** Although this should be done, it does not address the spouse's immediate concern.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

145. **1 This recognizes and acknowledges the client's concerns without assuming a specific feeling is involved; it allows the client to set the framework for discussion and express self-identified feelings.**

**2** This is an assumption by the nurse; the client's statement is not specific enough to come to this conclusion. **3, 4** This avoids the client's concerns and cuts off communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

146. **1 People in panic may initiate a group panic reaction even in those who appear to be in control.**

**2** Comatose individuals will not cause panic in others. **3** Euphoric individuals will not adversely affect others. **4** Depressed people will be quiet and not affect others.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Emergency Situations, Concepts Related to First Aid](#)

147. **1 Core rewarming with heated oxygen and administration of warmed oral or intravenous fluids is the preferred method of treatment.**

**2** The client will be too weak to ambulate. **3** Oral temperatures are not the most accurate assessment of core temperature because of environmental influences. **4** Warmed oral feedings are advised; gavage feedings are unnecessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Specific Emergencies](#)

**148. 3 Clothing retains body heat; clothing must be removed before other cooling methods are employed to reduce body temperature.**

**1** Offering fluids is contraindicated because the client is unresponsive. **2** There are no data to indicate a need for suctioning. **4** Although intubation may become necessary, it is not the initial action.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Emergency Situations, Specific Emergencies](#)

**149. 3 The high osmotic pressure of the salt water draws fluid from the vascular space into the alveoli, causing hypovolemia.**

**1, 2, 4** This involves aspiration of hypotonic freshwater, which causes fluid to move into the vascular system, leading to fluid overload.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Emergency Situations, Specific Emergencies](#)

**150. Answer: 2, 4.**

**1** Fever may not cause difficult breathing. **2** Increased body heat dilates blood vessels, causing a flushed face. **3** Pain is not related to fever. **4** The pulse rate increases to meet increased tissue demands for oxygen in the febrile state. **5** Blood pressure is not expected to increase with fever.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, General Nursing Care of Clients at Risk for Infection](#)

**151. 2 The client who is prescribed bed rest must exercise the legs; dorsiflexion of the feet prevents venous stasis and thrombus formation.**

**1** Limiting fluid intake may lead to hemoconcentration and subsequent thrombus formation. **3** This improves pulmonary function but does not prevent venous stasis. **4** This is unsafe because it promotes venous stasis by compressing the popliteal space.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care for Clients during the Postoperative Period](#)

**152. 1 Paralysis of the sympathetic vasomotor nerves after administration of a spinal anesthetic results in dilation of blood vessels, which causes a subsequent decrease in blood pressure.**

**2** These receptors are sensitive to pH, oxygen, and carbon dioxide tension; they are not related to hypotension and are not affected by spinal anesthesia. **3** The strength of cardiac contractions is not affected by spinal anesthesia. **4** The cardiac accelerator center neurons in the medulla regulate heart rate; they are not related to hypotension

and are not affected by spinal anesthesia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Related Pharmacology, Local Anesthetics](#)

**153. 2 Clients adapting to illness frequently feel afraid and helpless and strike out at health team members as a way of maintaining control or denying their fear.**

**1** There is no evidence that the client denies the existence of the health problem.

**3** Although disorders such as brain attacks and atherosclerosis, which are associated with hypertension, may lead to cerebral anoxia, there is insufficient evidence to support this conclusion. **4** Captopril (an antihypertensive) is a renin-angiotensin antagonist that reduces blood pressure and does not cause behavioral changes; alprazolam is prescribed to reduce anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 1, Grieving Process](#)

**154. 1 The client and significant family members should be included in dietary teaching; families provide support that promotes adherence.**

**2** The client has already received this information. **3** This could violate confidentiality.

The client should be involved in his or her own care; the client will ultimately assume the responsibility. **4** The dietitian is a resource person who can give specific, practical information about diet and food preparation once there is a basic understanding of the reasons for the diet.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Teaching-Learning](#)

**155. 3 Individuals born after 1957 should receive one additional dose of measles, mumps, and rubella (MMR) vaccine if they are students in postsecondary educational institutions.**

**1** Currently there is no vaccine for hepatitis C. **2** The influenza B (H1B) immunization is unnecessary. **4** If the student received an additional tetanus/diphtheria vaccine (DTaP) at age 12, it is not necessary. A booster dose of tetanus toxoid (Td) should be received every 10 years.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Review of Physiology \(Immunity\)](#)

**156. 4 The Centers for Disease Control and Prevention recommend that adults be immunized with pneumococcal vaccine at age 65 or older with a single dose of the vaccine; if the pneumococcal vaccine was received before 65 years of age or if there is the highest risk of fatal pneumococcal infection, revaccination should occur 5 years after the initial vaccination.**

**1** The pneumococcal vaccine should not be administered every 2 years. **2, 3** The pneumococcal vaccine should not be administered annually.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 3, Infection, Review of Physiology \(Immunity\)](#)

**157. 2 The gamma-globulin fraction in the plasma is the fraction that includes the antibodies.**

**1** Albumin helps regulate fluid shifts by maintaining plasma oncotic pressure. **3** Thrombin is involved with clotting. **4** Hemoglobin carries oxygen.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Infection, Review of Physiology \(Immunity\)](#)

**158. 4 Gamma globulin, which is an immune globulin, contains most of the antibodies circulating in the blood. When injected into an individual, it prevents a specific antigen from entering a host cell.**

**1, 3** Gamma globulin does not stimulate antibody production. **2** This does not affect antigen-antibody function.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Infection, Review of Physiology \(Immunity\)](#)

**159. 3 Human tetanus antitoxin (tetanus immune globulin [TIG]) provides antibodies against tetanus; it is used for the individual who may be infected and has never received tetanus toxoid or has not received it for more than 10 years. It confers passive immunity.**

**1** Administration of the tetanus toxoid (Td) will produce active, not passive, immunity. **2** Although equine tetanus antitoxin provides passive immunity, the risk for a hypersensitivity reaction is high and therefore TIG is preferred. **4** Diphtheria, tetanus, pertussis (DTaP) vaccine produces active, not passive, immunity; in addition, DTaP usually is not given to adults.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Infection, Review of Physiology \(Immunity\)](#)

**160. 2 Tetanus antitoxin provides antibodies, which confer immediate passive immunity.**

**1** Antitoxin does not stimulate production of antibodies. **3** It provides passive, not active, immunity. **4** Passive immunity, by definition, is not long-lasting.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Infection, Review of Physiology \(Immunity\)](#)

**161. 3 After a submucosal resection (SMR), hemorrhage from the area should be suspected if the client is swallowing frequently or expelling blood with saliva.**

**1** A headache in the back of the head is not a complication of a submucosal resection. **2** Crepitus is caused by leakage of air into tissue spaces; it is not an expected complication of SMR. **4** The nerves and structures involved with speech are not within the operative area. However, the sound of the voice is altered temporarily by the presence of nasal packing and edema.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**162. 4 Additional fluid from surrounding tissues will be drawn into the lung because of the high osmotic pressure exerted by the salt content of the aspirated ocean water; this results in pulmonary edema.**

**1** Hypoxia and acidosis may occur after a near-drowning. **2** This is not a sequela of near-drowning. **3** Hypovolemia occurs because fluid is drawn into the lungs by the hypertonic saltwater.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Emergency Situations, Specific Emergencies](#)

**163. 4 This minimizes pooling of respiratory secretions and maximizes chest expansion, which aids in the removal of secretions; this helps maintain the airway and is an independent nursing function.**

**1, 2** This is part of pulmonary therapy that requires a health care provider's order. **3** This will remove secretions once they accumulate in the upper airway, not prevent their accumulation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**164. 2 Turning the client to the side promotes drainage of secretions and prevents aspiration, especially when the gag reflex is not intact. This position also brings the tongue forward, preventing it from occluding the airway when it is in the relaxed state.**

**1** The risk for aspiration is increased when this position is assumed by a semialert client. **3** This may cause the neck to flex in a client who is not alert, interfering with respirations. **4** This position is not used for a postoperative client because it interferes with breathing.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**165. 3 Maintenance of a patent airway is always the priority, because airway obstruction impedes breathing and may result in death.**

**1, 2, 4** This is important postoperative care; however, a patent airway is the priority.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**166. 2 During radiation therapy with radium implants the client is placed in isolation so that exposure to radiation by family and staff is decreased.**

**1** This is unnecessary; a full bladder will not disrupt the seeds. **3** Excess exposure to radiation is hazardous to personnel. **4** Gloves will not protect the nurse from radiation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Radiation](#)

**167. 2 The nurse should anticipate drainage and reinforce the surgical dressing as**

**needed.**

**1** Changing a dressing at this time is unnecessary and increases the risk for infection. **3** Montgomery ties are used when frequent dressing changes are anticipated; they are not appropriate at this time. **4** An abdominal binder is rarely ordered, and it will interfere with assessment of the dressing at this time.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**168. 2 Paralytic ileus occurs when neurologic impulses are diminished as a result of anesthesia, infection, or surgery.**

**1** Interference in blood supply will result in necrosis of the bowel. **3** Perforation of the bowel will result in pain and peritonitis. **4** Obstruction of the bowel will initially cause increased peristalsis and bowel sounds.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

►**169. Answer: 1, 3.**

**1** Ambulation will stimulate peristalsis, increasing passage of flatus and decreasing distention. **2** Carbonated beverages such as ginger ale increase flatulence and should be avoided. **3** Monitoring bowel sounds is important because it provides information about peristalsis. **4** Using a straw should be avoided because it causes swallowing of air, which increases flatulence. **5** Opioids will slow peristalsis, contributing to increased distention.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

►**170. Answer: 4, 5.**

**1** Diplopia does not indicate an electrolyte deficit. **2** A skin rash does not indicate an electrolyte deficit. **3** Leg cramps occur with potassium excess, not deficit. **4** Potassium, the major intracellular cation, functions with sodium and calcium to regulate neuromuscular activity and contraction of muscle fibers, particularly the heart muscle; tachycardia is associated with hypokalemia. **5** Hypokalemia is associated with diarrhea. Muscle weakness occurs with hypokalemia because of the alteration in the sodium potassium pump mechanism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Fluid and Electrolyte Balance](#)

►**171. Answer: 2, 4.**

**1** A change in status does not require medication reconciliation. **2** Medication reconciliation involves the creation of a list of all medications the client is taking and comparing it to the health care provider's orders on admission. **3** A medication reconciliation should be completed long before this time. **4** Medication reconciliation involves the creation of a list of all medications the client is taking and comparing it to the health care provider's orders when there is a transfer to a different setting or

service, and/or discharge. **5** Total hip replacement is elective surgery, and scheduling takes place before admission; medication reconciliation takes place when the client is admitted.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, Nursing Responsibilities Related to Medication Administration](#)

►172. Answer: **1, 2.**

**1** Ibuprofen (Motrin, Advil) irritates the gastrointestinal (GI) mucosa and can cause mucosal erosion, resulting in bleeding; blood in the stool (melena) occurs as the digestive process acts on the blood in the upper GI tract. **2** Hemoglobin, which carries oxygen to body cells, is decreased with anemia; the heart rate increases as a compensatory response to increase oxygen to body cells. **3** Constipation usually is related to immobility, a low-fiber diet, and inadequate fluid intake, not the data listed in this situation. **4** Clay-colored stools are related to biliary problems, not GI bleeding. **5** Painful bowel movements are related to hemorrhoids, not GI bleeding.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Pain, Related Pharmacology](#)

173. **1** The Nurse Practice Act states that the nurse will do health teaching and administer nursing care supportive to life and well-being.

**2** The teaching was essential before discharge. **3** The client is responsible for self-care. **4** Health teaching is an independent nursing function.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

174. **2** Unwashed hands are considered contaminated and are used to turn on sink faucets. Recontamination of washed hands may be prevented by using foot pedals or a paper towel barrier when closing the faucets.

**1** They are not considered contaminated for this reason; areas cannot be sterile. **3** It is unrelated to the number of people but rather to being touched by contaminated hands. **4** Although bacterial growth is facilitated in moist environments, this is not why sink faucets are considered contaminated.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** [Ch 3, Infection, Review of Microbiology](#)

175. **4** Friction is necessary for the removal of microorganisms.

**1** Although soap reduces surface tension, which helps remove debris, without friction it has minimal value. **2** Although the length of time the hands are washed is important, without friction it has minimal value. **3** Although water flushes some microorganisms from the skin, without friction it has minimal value.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

[Ch 3, General Nursing Care of Clients at Risk for Infection](#)

176. **4** When a sterile surface becomes wet, microorganisms from the unsterile surface below the sterile field will be drawn up, contaminating the sterile field. The absorption

**of fluids by gauze results from the adhesion of water to the gauze threads; the surface tension of water causes contraction of the fiber, pulling fluid up the threads.**

**1** Dialysis is separation of substances in solution utilizing their differing rates of diffusion through a membrane. **2** Osmosis refers to movement of water through a semipermeable membrane. **3** Diffusion is movement of molecules from a high to a low concentration.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients at Risk for Infection](#)

**177. 1 Surgical asepsis means that practices are employed to keep a defined site or objects free of all microorganisms.**

**2, 3** This applies to personal protective equipment and medical asepsis. **4** This applies to medical asepsis.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients at Risk for Infection](#)

**178. 4 This covering will not adhere to the wound, and it will protect the area until the health care provider arrives.**

**1, 2** This is not the priority; the client has needs that must be met first. **3** This is contraindicated because it may injure delicate tissues and organs; also it is not within the scope of nursing practice.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**179. 4 A portable wound drainage system (e.g., Jackson-Pratt, Hemovac) is compressed before closing the port to reestablish the negative pressure necessary for suction.**

**1** This is not necessary; a portable wound drainage system usually removes excess drainage before it leaks onto the dressing. **2** Portable wound drainage systems are not irrigated because this will increase the risk of instilling microorganisms into the wound. **3** The nurse should avoid touching the port because it is sterile.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**180. 4 Vitamin C (ascorbic acid [Ascorbicap]) plays a major role in wound healing. It is necessary for the maintenance and formation of collagen, the major protein of most connective tissues.**

**1** Vitamin A (Aquasol A) is important for the healing process; however, vitamin C is the priority because it cements the ground substance of supportive tissue. **2** Cyanocobalamin (Cobex) is a vitamin B<sub>12</sub> preparation needed for red blood cell synthesis and a healthy nervous system. **3** Phytonadione (Mephyton) is vitamin K, which plays a major role in blood coagulation.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of](#)

## Clients during the Postoperative Period

**181. 2 According to the Nurse Practice Act, a nurse may independently treat human responses to actual or potential health problems.**

**1** An activity level is prescribed by a health care provider; this is a dependent function of the nurse. **3** There is not enough information to come to this conclusion. **4** Application of an emollient and reinforcing a dressing are independent nursing functions.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**182. 1 Clients should change position at least every 2 hours to prevent pressure ulcers. The nurse should not deviate from this standard of practice because of the cognitively-impaired client's refusal to move. The nurse was negligent for not changing the client's position.**

**2** Although pressure ulcers may occur, nursing care must include preventive measures. **3** The family is included in the health team. **4** When a capable client refuses necessary health care, the nurse should provide health teaching to promote understanding of the treatment plan. If the client makes an informed decision after an explanation, then the client's rights must be respected; however, this client is cognitively impaired.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2, The Nurse's Rights and Responsibilities](#)

**183. 3 The mucosal lining of the oral cavity, oropharynx, and esophagus is sensitive to the effects of radiation therapy; the inflammatory response causes mucosal edema that may progress to an airway obstruction.**

**1** A decrease in salivary secretions resulting in dry mouth may interfere with nutritional intake, but it is not life-threatening. **2** Erythema of the skin may cause dry or wet desquamation, but it is not life-threatening. **4** Radiation to the neck area should not produce as significant bone marrow suppression as radiation to the other sites.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Radiation](#)

**184. 2 Current radiation therapy accurately targets malignant lesions with pinpoint precision, minimizing the detrimental effects of radiation to healthy tissue.**

**1** The dose is not as significant as the extent of tissue being irradiated. **3** When radiation therapy is prescribed, the health care provider takes into consideration the ability of the client to tolerate the therapy, determining that the benefit outweighs the risk. **4** This does not influence radiation's effect.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Radiation](#)

**185. 2 Radiodermatitis occurs 3 to 6 weeks after the start of treatment.**

**1** The word "burn" should be avoided because it may increase anxiety. **3** Emollients are contraindicated; they may alter the calculated x-ray route and injure healthy tissue. **4** This response does not address the client's concern.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 3, Radiation](#)

**186. 1 Cold reduces the sensitivity of pain receptors in the skin. In addition, local blood vessels constrict, limiting the amount of edema and its related pressure and discomfort.**

**2** Local blood vessels constrict. **3** Local cold applications do not depress vital signs. **4** Local cold applications do not directly affect blood viscosity. This is not a clinical indicator that a nurse can observe.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Nonpharmacologic Pain Management Strategies](#)

►187. Answer: 1, 5.

**1** Stupor may occur with hypothermia because of slowed cerebral metabolic processes. **2** Pallor, not erythema, is present as a result of peripheral vasoconstriction. **3** Drowsiness occurs; the client is unable to focus on anxiety-producing aspects of the situation. **4** Respirations are decreased. **5** Peripheral vasoconstriction and the effect of cold on the peripheral nervous system result in paresthesias in the affected body parts.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, Emergency Situations, Specific Emergencies](#)

►188. Answer: 2, 3, 4, 5.

**1** Massage is contraindicated because it may injure tissues that have sustained frostbite. **2** A rectal temperature provides the most accurate temperature. **3** Older adults have less subcutaneous fat and inefficient temperature regulating mechanisms, which makes them vulnerable to extremes in environmental temperature. The extremities are more distal sites of circulation and are at increased risk for frostbite. **4** Hypothermia decreases cerebral perfusion, which will result in confusion and a decreased level of consciousness. **5** Significant others should be notified of the client's admission to the emergency department, if condoned by the client. Significant others can provide additional client information and may be a support for the client.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Emergency Situations, Specific Emergencies](#)

**189. 2 Immediately before administration of an analgesic, an assessment of vital signs is necessary to determine whether any contraindications to the medication exist (e.g., hypotension, respirations  $\leq 12$  breaths/min).**

**1** Pain prevents both psychologic and physiologic rest. **3** Before administration of an analgesic, the nurse must check the health care provider's prescription, the time of the last administration, and the client's vital signs. **4** A complete assessment including vital signs should be done before documenting.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients in Pain](#)

**190. 3 Electrodes are attached to sensory nerves or over the dorsal column; a transmitter**

**is worn externally and, by electric stimulation, may be used to interfere with the transmission of painful stimuli as needed.**

**1** Clients may bathe when the transmitter is disconnected. **2** The client may need analgesics in conjunction with the transmitter. **4** The transmitter should not interfere with other electronic devices.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients in Pain](#)

**191. 4 The exact nature of the pain must be determined to distinguish whether or not it is a result of the surgery.**

**1, 2, 3** This should be done later; the first action is to determine the cause of the pain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, General Nursing Care of Clients in Pain](#)

**192. 2 Initially, integrity of the intravenous system should be verified to ensure that the client is receiving medication. The intravenous tubing may be kinked or compressed, or the catheter may be dislodged.**

**1** Continued monitoring will result in the client experiencing unnecessary pain. **3** The nurse may not reprogram the pump to deliver larger or more frequent doses of medication without a health care provider's prescription. **4** The health care provider should be notified if the system is intact and the client is not obtaining relief from pain. The prescription may have to be revised; the basal dose may be increased, the length of the delay may be reduced, or another medication or mode of delivery may be prescribed.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Related Pharmacology, Opioid Analgesics](#)

**193. 3 The voltage or current is adjusted on the basis of the degree of pain relief experienced by the client.**

**1** This may provide too little or too much stimulation to achieve the desired response. **2** This is true of the pain suppressor transcutaneous electrical nerve stimulation (TENS) unit, not the conventional unit. **4** The electrodes should be applied either on the painful area or immediately below or above the area.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, Nonpharmacologic Pain Management Strategies](#)

**194. 1 Pain may indicate a toxic effect.**

**2, 3** This is an expected side effect of internal radiotherapy. **4** This is associated with the need to maintain position, not with radium itself.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 3, Radiation](#)

**195. 3 Radium must be handled with long forceps because distance helps limit exposure.**

**1** A nurse does not clean radium implants. **2** This does not provide adequate shielding from the gamma rays emitted by radium. **4** The amount and duration of exposure are

important in assessing the effect on the client; however, this will not affect safety during removal.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

**196. 1 Packing maintains a radium implant in its correct placement; correct placement minimizes the effect on healthy tissue.**

**2** There should not be active bleeding with a radium implant; cellular sloughing is expected. **3** This is not true. **4** Although exposure to the radioactive packing damages healthy tissue, it is not life-threatening.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

**197. 2 Restriction of each visitor to a 10-minute stay minimizes the risk for exposure. Some institutions will not allow visitors while an implant is in place.**

**1** The urine is not radioactive. **3** Lead-lined aprons are not effective shields against rays emitted by internal sources of radiation. **4** Radium implants will not affect the location of intramuscular injections.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

**198. 2 Before discharge it is important for the nurse to instruct the client to return for follow-up care at specified intervals.**

**1** Fluids are not reduced unless cardiac or renal pathology is present. **3** When the implant is in place, a low-residue diet is indicated to avoid pressure from a distended colon; when the radium implant is removed, the client can return to a regular diet. **4** If the diet is adequate, mineral supplements are unnecessary.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

**199. 1 Frequent position changes are important to ensure urinary drainage; gravity promotes flow, which prevents obstruction.**

**2** This is not a priority unless the client is sedated. **3** Range-of-motion exercises are of minimal importance because the client is able to move without limitation. **4** Back care is necessary, but it is not the priority.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 3, General Nursing Care of Clients during the Postoperative Period](#)

**200. 2 The prevention of infection is the priority because an infection can be life-threatening for a client who is immunocompromised. Chemotherapeutic medications depress the bone marrow, causing leukopenia. This client's white blood cell count is below the expected range of 4500 to 11,000/mm<sup>3</sup> for an older female adult. While the elevation in the client's temperature, pulse, and respirations may be related to the direct**

effects of the chemotherapeutic agents, they also may reflect that the client is resisting a microbiologic stress.

**1** Although a balance between rest and activity is important, it is not the priority. While chemotherapeutic medications depress the bone marrow and cause anemia, this client's red blood cell count is within the expected range of 4.0 to 5.0 million/mm<sup>3</sup> for an older female adult. The client's hemoglobin level is within the expected range of 11.5 to 16.0 g/dL. **3** Even though preventing injury is important, it is not the priority. Although chemotherapeutic medications depress the bone marrow, causing thrombocytopenia, this client's platelet count is within the expected range of 150,000 to 400,000/mm<sup>3</sup> for an adult. **4** While maintaining fluid balance is important, it is not the priority. The client's hematocrit is within the expected range of 38% to 41% for an older female adult, indicating that the client is not dehydrated. The client's blood pressure is not decreased, which occurs with dehydration. Although chemotherapeutic medications may cause nausea, vomiting, and diarrhea, the client did not indicate that these occurred.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** [Ch 3, General Nursing Care of Clients with Neoplastic Disorders](#)

---

## UNIT 2

# Medical-Surgical Nursing

# CHAPTER 5

# Growth and Development of the Adult

---

# The Young Adult (Age 20 to 44 Years)

## Data Base

### A Physiologic development

1. Physical maturation occurs
2. Muscle strength and coordination peak
3. Biorhythms are established
4. Sexuality
  - a. Established sex drive remains high for men
  - b. Female sex drive reaches peak during later phase of young adulthood
  - c. Physiologically optimal period for childbearing
5. Basal metabolic rate (BMR) decreases at 2% to 4% per decade after 20 years of age

### B Psychosocial development

1. Mental abilities reflect formal operations (see Chapter 34, Nursing Care of Adolescents, Growth and Development)
2. Resolving developmental crisis of intimacy versus isolation and beginning to resolve developmental crisis of generativity versus stagnation
3. Establishing new family relationships and parenting patterns
4. Establishing self in, and advancing in, chosen occupation

C Common health problems: accidents, acquired immunodeficiency syndrome (AIDS), sexually transmitted infections (STIs), cancer involving reproductive organs, hypertension, suicide, alcoholism, spousal abuse, fertility regulation, periodontal disease, unbalanced diet, obesity, intimacy problems

## General Nursing Care of Young Adults

### Assessment/Analysis

1. Obtain history of drug/alcohol use, sexual practices, family relationships
2. Determine baseline height/weight, dietary history
3. Measure vital signs to establish baseline
4. Determine health practices related to cancer prevention/detection

### Planning/Implementation

1. Encourage attendance at safety programs to promote accident prevention (e.g., defensive driving)
2. Increase public awareness of problems and availability of crisis counseling, support groups, other community resources (e.g., hot lines, Alcoholics Anonymous, family planning clinics)
3. Teach safe sex practices
4. Promote awareness that optimal diet and exercise are essential to achieving and maintaining optimal health; encourage nutritional evaluation and consultation
5. Teach to use exogenous supplemental vitamins with caution, especially vitamins A, D,

and E; excessive doses can cause health problems

6. Teach dietary guidelines following U.S. Department of Agriculture (USDA) recommendations

- a. Eat a variety of foods
- b. Maintain healthy body mass index (BMI)
- c. Reduce saturated fat, cholesterol
- d. Eat adequate amount of vegetables, grain products, fruit (fruits are low in sodium but high in sugar)
- e. Use salt in moderation
- f. Limit daily intake of alcoholic beverages to no more than one drink for women and two drinks for men
- g. Maintain recommended daily caloric and calcium intake

7. Teach breast and testicular self-examination techniques; encourage regular medical checkups

## **Evaluation/Outcomes**

1. Establishes safe health care practices
2. Maintains ideal body weight
3. Maintains blood pressure within expected limits
4. Remains free from infection

# The Middle-Age Adult (Age 45 to 59 Years)

## Data Base

### A Physiologic development

1. Greater diversity in physiologic conditioning results from established lifestyle
2. Early clinical findings of aging (e.g., wrinkling, thinning hair, decreased muscle tone, decreased nerve function)
3. Decreased BMR with subsequent weight gain unless caloric intake is reduced
4. Decreased production of sexual hormones
  - a. Menopause (see Chapter 23, Childbearing and Women's Health Nursing, Perimenopause)
  - b. Male climacteric; may pass unnoticed, especially in those with high self-esteem; clinical findings may include diminished potency, less forceful ejaculation, thinning/graying hair, fatigue, depression

### B Psychosocial development

1. Cognitive abilities enhanced because of motivation, past experiences
2. Resolving developmental crisis of generativity versus stagnation
3. Adjusting to changes in family caused by aging parents, growing or returning children
4. Maintaining satisfactory status in one's career
5. Accepting physical changes associated with advancing age
6. Developing personally satisfying social and civic activities

C Health problems: cardiovascular disease, hypertension, alcoholism, sexual dysfunction, presbyopia, unbalanced/inadequate diet, deteriorating vision/hearing, type 2 diabetes, obesity, depression

## *General Nursing Care of Middle-Age Adults*

### Assessment/Analysis

1. Determine cardiovascular status (e.g., vital signs, peripheral pulses, peripheral edema, shortness of breath, chest pain)
2. Measure visual acuity
3. Obtain history of alcohol use, sexual patterns, family relationships
4. Determine baseline height/weight, dietary history
5. Question client about leisure activities, retirement plans

### Planning/Implementation

1. Reinforce importance of regular exercise to prevent cardiovascular, musculoskeletal deterioration
2. Emphasize dietary changes (e.g., reduction of calories, fats, protein; increased calcium, fiber; encourage to follow USDA recommendations)
3. Stress need for regular medical evaluations and self-evaluations
4. Encourage attendance at self-help groups to stop substance dependency (e.g.,

smoking, drinking alcohol, overeating)

## **Evaluation/Outcomes**

1. Maintains ideal body weight
2. Maintains blood pressure within expected limits
3. Establishes healthy dietary pattern
4. Participates in exercise regimen
5. Develops coping skills to manage stress

# The Young-Older Adult (Age 60 to 74 Years)

## Data Base

### A Physiologic development

1. Slowing of reaction time
2. Decrease in sensory acuity
3. Diminished muscle tone, strength
4. Problems associated with dental caries, ill-fitting dentures, or no teeth/dentures
5. Increased diversity in health status/function resulting from earlier lifestyle
6. Development of chronic health problems

### B Psychosocial development

1. Cognitive abilities may be affected by cardiovascular disease
2. Adjusting to retirement; some individuals experience loss of self-esteem; others enjoy freedom to explore other interests
3. Coping with altered economic status; adjusting to fixed income
4. Resolving death of parents and possibly spouse
5. Accepting separation from children and their families
6. Resolving developmental crisis of ego integrity versus despair
7. May experience depression

C Health problems: cardiovascular disease, cancer, presbyopia, accidents, respiratory disease, osteoporosis/osteoarthritis, hearing loss (especially for high-pitched sounds), unbalanced/inadequate diet, depression

## *General Nursing Care of Young-Older Adults*

### Assessment/Analysis

1. Determine cardiovascular status (e.g., vital signs, peripheral pulses, peripheral edema, shortness of breath, history of chest pain, changes in sensation)
2. Measure visual/auditory acuities
3. Obtain history relative to warning signs of cancer
4. Identify coping skills, support systems

### Planning/Implementation

1. Encourage to maintain schedule of regular medical, dental, visual examinations to prevent or control health problems
2. Assess living conditions for hazards that can cause accidents
3. Refer widows/widowers to appropriate self-help groups as necessary
4. Encourage to anticipate/plan for retirement and to develop new interests/support systems
5. Encourage nutritional assessment/consultation to prevent nutrient deficiencies and to provide for diet modifications appropriate for aging

## Evaluation/Outcomes

1. Participates in exercise program
2. Verbalizes fears to health care providers
3. Remains free from injury
4. Maintains satisfying interpersonal relationships
5. Consumes nutritionally adequate diet
6. Maintains therapeutic regimen

# **The Middle-Older Adult (Age 75 to 84 Years) and Old-Older Adult (Age 85+ Years)**

## **Data Base**

### **A Physiologic development**

1. Diminished sensation (e.g., visual, auditory), diminished reaction time
2. Increased sensitivity to cold because of decreased subcutaneous tissue, decreased thyroid functioning, impaired circulation
3. Decreased enzyme secretion/motility of gastrointestinal (GI) tract
4. Decreased glomerular filtration rate
5. Decreased cardiac output
6. Arteriosclerotic changes with diminished elasticity of blood vessels
7. Decreased lung capacity
8. Demineralization and other degenerative skeletal changes, particularly in weight-bearing bones
9. Muscle atrophy
10. Decreased metabolic rate and declining function of organs (e.g., liver, kidneys); increased risk of adverse reaction or toxicity when taking medications

### **B Psychosocial development**

1. Cognitive abilities not necessarily affected by age, but may be impaired as result of disease, leading to diminished awareness and increased safety risk
2. Resolving developmental crisis of ego integrity versus despair; depends on previous resolution of task of generativity versus stagnation
3. Adjusting to death of significant others
4. Adapting to decreased physical capacity, changes in body image
5. Adjusting to economic burden of fixed income
6. Recognizing inevitability of death
7. Reminiscing increasingly about past

**C Health problems:** cardiovascular disease, cancer, accidents (e.g., falls, automobile collisions), respiratory disease, cerebral vascular insufficiency, malnutrition, problems with perception (e.g., cataracts, glaucoma, hearing loss)

## ***General Nursing Care of Middle-Older and Old-Older Adults***

### **Assessment/Analysis**

1. Determine cardiovascular status: vital signs, peripheral pulses, peripheral edema, shortness of breath, history of chest pain, changes in sensation
2. Identify neurologic deficits: level of consciousness, orientation, motor function, sensory function
3. Identify deteriorating musculoskeletal functioning, effect on quality of life
4. Determine respiratory function: respiratory rate, rhythm, depth; use of accessory

- muscles; breath sounds; pulmonary function tests; oxygen saturation level
5. Review nutritional status (e.g., dietary history, height/weight, skin condition, serum protein and albumin levels)
  6. Ascertain medications taken routinely (chronic health problems and use of over-the-counter medications leads to polypharmacy)
  7. Assess coping abilities
  8. Assess resources/support systems

## **Planning/Implementation**

1. Encourage to maintain schedule of regular medical supervision and exercise
2. Promote maximal degree of independence
3. Initiate appropriate referrals for those requiring assistance with activities of daily living
4. Open channels of communication for reality orientation, reminiscing, emotional support; explain procedures/expectations; reinforce as necessary
5. Refer to social services and other resources that can provide economic assistance
6. Ensure appropriate fit of prosthetic devices (e.g., dentures, contact lenses, eye prosthetics, hearing aids, braces, limbs); teach proper care of such devices
7. Encourage to follow USDA dietary recommendations/reduced caloric intake

## **Evaluation/Outcomes**

1. Performs or assists with self-care activities
2. Remains free from injury
3. Uses community resources to maximize independence
4. Maintains nutritionally adequate diet
5. Maintains social relationships
6. Adjusts to changes in functional abilities
7. Maintains therapeutic regimen

# CHAPTER 6

# **Nursing Care of Clients with Circulatory System (Cardiovascular, Blood, and Lymphatic Systems) Disorders**

---

# Overview

## Review of Anatomy and Physiology

### **Blood**

A Volume: males: 5 to 6 L; females: 4.5 to 5.5 L

B Viscosity: about 5.5 times as viscous as pure water; reflected by hematocrit (percentage of blood volume that is made up of red blood cells [RBCs])

1. Males: 45% to 52%

2. Females: 37% to 48%

C Hematopoiesis

1. Location: red marrow of vertebrae, sternum, ribs, iliac crests, clavicles, scapulae, and skull

2. Pluripotential stem cell differentiates into myeloid and lymphoid stem cells

a. Myeloid stem cells further differentiate into erythrocytes, platelets, neutrophils, monocytes, eosinophils, basophils, and mast cells

b. Lymphoid stem cells further differentiate into B and T lymphocytes

D Blood components

1. Plasma

a. Water: 3 L in average adult; 90% of plasma

b. Ions: see Fluid, Electrolyte, and Acid-Base Balance in [Chapter 3](#)

c. Albumin (major plasma protein)

(1) Acts as a buffer

(2) Maintains plasma colloid osmotic pressure

d. Glucose: prime oxidative metabolite

e. Serum: plasma with fewer or no coagulating proteins

2. Formed elements

a. Erythrocytes (RBCs)

(1) Shape: pliable biconcave disk that maximizes surface area proportional to volume for ease of diffusion of gases

(2) Number: males:  $4.5$  to  $6.2 \times 10^6/\text{mm}^3$ ; females:  $4.0$  to  $5.5 \times 10^6/\text{mm}^3$

(3) Formation (erythropoiesis): liver and kidneys secrete proteins that help form erythropoietin, which stimulates erythrocyte production by red bone marrow

(4) Principal component is hemoglobin; functions to bind oxygen through iron in heme and carbon dioxide through globulin portion; can carry both simultaneously

(5) Erythrocytes live for about 120 days; old or deteriorated ones are removed by reticuloendothelial cells of liver, spleen, and bone marrow; heme is converted to bilirubin, which is excreted from liver as part of bile

b. Leukocytes white blood cells [WBCs]

(1) Types

(a) Granulocytes (polymorphonuclear): neutrophils, eosinophils, and basophils

(b) Agranulocytes (mononuclear): monocytes that become macrophages in tissue spaces and lymphocytes

(2) Functions

(a) Phagocytosis of bacteria by neutrophils and macrophages; phagocytosis of antigen-antibody complexes by eosinophils

(b) Antibody synthesis: B lymphocytes become plasma cells, which produce most circulatory antibodies

(c) Destruction of transplanted tissues and cancer cells by T lymphocytes, which form in lymphoid tissue and mature in the thymus

(3) Leukocytes live for a few hours or days; some T lymphocytes live for many years and provide long-term immunity

c. Platelets (thrombocytes)

(1) Number: 150,000 to 450,000/mm<sup>3</sup>

(2) Function in blood coagulation (agglutination, adhesiveness, aggregation)

(a) Adhere to each other and to damaged areas of circulatory system to limit or prevent blood loss

(b) Release chemicals that constrict damaged blood vessels

E Blood groups

1. Four blood types: A, B, AB, and O; type indicates antigens on or in the RBC membrane (e.g., type A blood has A antigens; type O blood has no antigens)
2. Blood can be either Rh-positive or Rh-negative; usually blood does not contain anti-Rh antibodies. However, Rh-negative blood will contain anti-Rh antibodies if the individual has been transfused with Rh-positive blood or has carried an Rh-positive fetus without treatment; Rh-positive blood never contains anti-Rh antibodies; people with Rh-positive blood can receive blood from an Rh-negative donor; people with Rh-negative blood cannot receive blood from an Rh-positive donor
3. Plasma: usually contains no antibodies against antigens present on its own RBCs, but does contain antibodies against other A or B antigens not present on its RBCs
4. The potential danger in transfusing blood is that the donor's blood may be agglutinated (clumped) by the recipient's antibodies

F Hemostasis: process to arrest blood loss ([Figure 6-1: Blood clotting mechanism](#))

**FIGURE 6-1** Blood clotting mechanism. The complex clotting mechanism can be condensed into three basic steps: (1) Release of clotting factors from both injured tissue cells and sticky platelets at the injury site (which form temporary platelet plug); (2) series of chemical reactions that eventually result in the formation of thrombin; and (3) formation of fibrin and trapping of blood cells to form a clot. (From Thibodeau GA, Patton KT: *Anatomy and physiology*, ed 6, St. Louis, 2007, Mosby.)

1. Vasoconstriction
2. Aggregation of platelets: adhere to damaged blood vessel walls, forming plugs
3. Blood coagulation (clotting): blood becomes gel as soluble fibrinogen is converted to insoluble fibrin
  - a. Extrinsic clotting mechanism: trigger is blood contacting damaged tissue
  - b. Intrinsic clotting mechanism: trigger is release of chemicals (platelet factors such as thromboplastin) from platelets aggregated at site of injury
  - c. Liver cells synthesize prothrombin, fibrinogen, and other clotting factors; adequate amounts of vitamin K must be present in blood for liver to produce prothrombin; calcium acts as a catalyst to convert prothrombin to thrombin
  - d. Prothrombin is converted to thrombin, which converts fibrinogen to fibrin; fibrin is an insoluble protein formed from soluble protein fibrinogen in the presence of thrombin; fibrin appears as a tangled mass of threads in which blood cells become enmeshed

- e. When new endothelial cells form, the fibrin clot is destroyed by plasmin, which is formed from plasminogen

## Heart

(Figure 6-2: Structures of the heart and course of blood through chambers)

**FIGURE 6-2** Structures of the heart and course of blood through chambers. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

### A Layers

1. Pericardium (protective covering): parietal and visceral (epicardium) layers create a protective sac containing a small amount of lubricating fluid that reduces friction
2. Myocardium (cardiac muscle cells): rhythmic contraction (systole) and relaxation (diastole) pumps blood through systemic and pulmonary circulations
3. Endocardium (endothelial inner lining of inner chambers and valves)

### B Chambers

1. Right atrium: receives deoxygenated blood from systemic circulation via the vena cava
2. Right ventricle: pumps deoxygenated blood to the pulmonary circulation via the pulmonary artery
3. Left atrium: receives oxygenated blood from the pulmonary circulation via the pulmonary vein
4. Left ventricle: pumps oxygenated blood to the systemic circulation via the aorta

### C Valves

1. Atrioventricular valves between atria and ventricles: tricuspid on right, mitral

(bicuspid) on left; valves consist of three parts: flaps or cusps, chordae tendineae, papillary muscles; closure during early systole prevents backward flow of blood (regurgitation) into atrium and causes first heart sound ( $S_1$ )

2. Semilunar valves: pulmonic valve between right ventricle and pulmonary arteries, and aortic valve between left ventricle and aorta; closure at end of systole prevents backward flow of blood into ventricles and causes second heart sound ( $S_2$ )
3. Auscultation for  $S_1$ ,  $S_2$ , murmurs caused by regurgitation of blood through valves, and snaps/clicks caused by stenosis of valves
  - a. Apical pulse or mitral valve: located at fifth intercostal space near left midclavicular line
  - b. Aortic valve: located at second intercostal space on right of sternum
  - c. Pulmonic valve: located at second intercostal space on left of sternum
  - d. Tricuspid valve: located at fifth intercostal space on left of sternum

#### D Blood supply to myocardium (heart muscle)

1. Left coronary artery branches from the aorta and divides to form left anterior descending artery and circumflex artery, supplying blood to anterior and inferior surfaces of left ventricle
2. Right coronary artery branches from the aorta, mainly supplying right side of heart, but also inferior surface of left ventricle
3. Greatest flow of blood into myocardium occurs when the heart relaxes (diastole), as a result of decreased arterial compression; an increased heart rate shortens diastole, leading to decreased time for myocardial perfusion
4. Relatively few anastomoses exist between the larger branches of the coronary arteries (poor collateral circulation); if one of these vessels becomes occluded suddenly, little or no blood can reach myocardial cells supplied by that vessel; however, collateral circulation can develop slowly over time

#### E Conduction system of heart: cardiac muscle cells have ability to generate impulses that cause contractions (automaticity)

1. Sinoatrial (SA) node: located in right atrial wall; referred to as pacemaker of the heart because it inherently generates impulses at the rate of 60 to 100/min
2. Atrioventricular (AV) node: located in base of the right atrium; capable of generating 40 to 60 impulses per minute if SA node is nonfunctional
3. Bundle of His: lies at the intraventricular septum and bifurcates into the right and left bundle branches; disruption in conduction here is called a bundle branch block
4. Purkinje fibers: extend from the right and left bundle branches, spreading electrical impulses throughout the ventricular walls
5. Usually a nerve impulse begins at the SA node and spreads through both atria to the AV node; after a short delay it is conducted to the bundle of His, bundle branches, and finally Purkinje fibers; the ventricles can generate 20 to 40 impulses per minute if both SA and AV nodes fail as pacemakers

#### F Cardiac output (CO) ( $CO = \text{heart rate} \times \text{stroke volume}$ ): volume of blood pumped per minute by the ventricles; average for adult at rest is approximately 5 L/min

1. Preload: extent to which left ventricle stretches at end of diastole as a result of left

ventricular end-diastolic volume; Frank-Starling law states when the heart is stretched by an increased returning volume of blood, it contracts more strongly, resulting in an increased stroke volume; subject to physiologic limitations

2. Afterload: arterial resistance that heart must overcome to eject contents of the left ventricle during systole; an increased afterload caused by systemic vasoconstriction will decrease stroke volume unless contractility is increased
3. Contractility: force of cardiac muscle contraction; increased by sympathetic nervous system, leading to increased stroke volume; decreased by parasympathetic nervous system; influences ejection fraction (percent of blood volume at the end of diastole that is ejected by ventricular contraction)
4. Heart rate: cardiac contractions per minute; increased by sympathetic nervous system and decreased by parasympathetic nervous system; bradycardia is a rate less than 60 beats/min; tachycardia is a rate greater than 100 beats/min

## **Blood Vessels**

### A Arteries

1. Carry blood away from heart (all arteries except pulmonary artery carry oxygenated blood)
2. Branch into smaller and smaller vessels called arterioles, which branch into microscopic capillaries
3. Structure: lining (tunica intima) of endothelium; middle coat (tunica media) of smooth muscle, elastic, and fibrous tissues, which permits constriction and dilation; outer coat (tunica adventitia or externa) of fibrous tissue; this firmness allows arteries to remain open instead of collapsing when cut
4. Peripheral pulses can be felt wherever an artery lies near the surface of the skin and over a firm background such as bone; sites: radial—at wrist; carotid—along anterior edge of sternocleidomastoid muscle, at level of lower margin of thyroid cartilage; brachial—at bend of the elbow, along inner margin of biceps muscle; femoral—in groin; popliteal—behind knee; posterior tibial—behind medial malleolus; dorsalis pedis—on anterior surface of foot, just below bend of the ankle; volume or amplitude of pulse may be absent, thready, diminished, have an acceptable volume, or bounding ([Figure 6-3](#): Palpation of the arterial pulses)

**FIGURE 6-3** Palpation of the arterial pulses. **A**, Carotid. **B**, Brachial. **C**, Radial. **D**, Femoral. **E**, Popliteal. **F**, Dorsalis pedis. **G**, Posterior tibial. (From Seidel HM et al: *Mosby's guide to physical examination*, ed 7, St. Louis, 2011, Mosby.)

5. Pulse deficit: difference between apical and radial pulses
6. Blood pressure: systolic—pressure within arteries when heart is contracting; diastolic—pressure within arteries when heart is at rest between contractions; pulse pressure—difference between systolic and diastolic pressures

## B Veins

1. Carry blood toward heart (all veins except pulmonary veins carry deoxygenated blood)
2. Branch into venules, which collect blood from capillaries; veins in cranial cavity formed by dura mater are called sinuses
3. Structure: same three coats as arteries, but thinner and fewer elastic and muscle fibers, allowing veins to collapse when cut; semilunar valves present in most veins more than 2 mm in diameter prevent backward flow of blood

## C Capillaries

1. Carry blood from arterioles and unite to form small veins or venules, which in turn unite to form veins
2. Exchange of substances between blood and interstitial fluid occurs in capillaries
3. Structure: only lining coat present (intima); wall only one cell thick to allow for diffusion of gases and small molecules

## **Regulatory Mechanisms Affecting Circulation**

### A Autonomic nervous system

1. Sympathetic nervous system: increases heart rate and cardiac contractility, dilates coronary and skeletal blood vessels, and constricts blood vessels supplying abdominal organs and skin through stimulation of alpha- and beta-adrenergic receptors by catecholamines (epinephrine, norepinephrine, dopamine)
2. Parasympathetic nervous system: decreases heart rate and contractility, and causes

vasodilation through cholinergic fibers; stimulation of vagus nerve initiates parasympathetic response

3. Baroreceptors in the aortic arch and carotid sinus respond to changes in BP
    - a. Increased arterial BP baroreceptors, which causes parasympathetic responses (vasodilation and decreased heart rate and contractility)
    - b. Decreased arterial pressure inhibits baroreceptors, which results in increased sympathetic responses (vasoconstriction and increased heart rate and contractility)
  4. Chemoreceptors respond to changes in levels of oxygen, carbon dioxide, and blood pH by stimulating the autonomic nervous system
- B Renin-angiotensin-aldosterone mechanism: when renal perfusion decreases, there is retention of sodium and water, which increases blood volume; vasoconstriction occurs, which increases BP
- C Intrinsic circulatory regulation: increased BP raises hydrostatic pressure of plasma, leading to increased filtration of plasma from intravascular to interstitial spaces, resulting in reduced venous return, decreased cardiac output, and decreased BP

## **Lymphatic System**

A Lymph vessels

1. Structure: lymph capillaries similar to blood capillaries in structure; larger lymphatics similar to veins but are thinner-walled, have more valves, and have lymph nodes along their course
2. Functions: return fluid and interstitial proteins to the venous system via thoracic and right lymphatic ducts at the junction between internal jugular and subclavian veins; interference with return of proteins to the blood results in edema

B Lymph nodes

1. Located throughout the body; usually occur in clusters
2. Functions: help defend the body against foreign substances (notably, bacteria and tumor cells)
  - a. Release lymphocytes into circulation for early identification of foreign substances
  - b. Respond to sensitized lymphocytes: dormant T and B lymphocytes in nodes enlarge, multiply, and differentiate to fight the invading substance

C Spleen

1. Location: left hypochondrium, above and behind cardiac portion of the stomach
2. Functions
  - a. Reticuloendothelial cells form macrophages that protect the body from antigens through phagocytosis; removes damaged cells from circulation
  - b. Contains B and T lymphocytes essential for humoral and cellular immune responses
  - c. Sequesters newly formed reticulocytes until they become mature erythrocytes; serves as reservoir of erythrocytes and platelets; sympathetic stimulation causes constriction of its capsule, squeezing out an estimated 200 mL of blood into general circulation within 1 minute

- d. Participates in the formation and development of blood cells (hematopoiesis) if bone marrow fails to function

## Review of Microorganisms

A *Streptococcus pyogenes*: gram-positive streptococcus; most virulent strain (group A beta hemolytic) causes scarlet fever, septic sore throat, tonsillitis, cellulitis, puerperal fever, erysipelas, rheumatic fever, and glomerulonephritis

B *Streptococcus viridans*: gram-positive streptococcus; distinguishable from *S. pyogenes* by its alpha hemolysis (rather than beta) of RBCs; common cause of infective endocarditis

C *Staphylococcus aureus*: gram-positive cocci associated with infective endocarditis in IV drug users

## Related Pharmacology

### Cardiac Glycosides

#### A Description

1. Increase force of cardiac contraction (positive inotropic effect) by increasing permeability of cardiac muscle membranes to calcium and sodium ions required for contraction of muscle fibrils
2. Decrease rate of cardiac contractions (negative chronotropic effect) by an action mediated through the vagus nerve; this action slows firing of the SA node and slows impulse transmission at the AV node
3. Slow conduction velocity (negative dromotropic effect); occurs by direct action and by increased vagal stimulation
4. Increase cardiac output by increasing effectiveness of heart pump
5. Effective in treating heart failure and atrial flutter and fibrillation
6. Available in oral and parenteral (intramuscular [IM], IV) preparations
7. Digitalization: rapid or slow administration of a loading dose to reach the therapeutic blood level; after desired effect is achieved the dosage is kept at a maintenance level, which replaces amount of drug metabolized and excreted each day
8. Used less often than newer classifications of cardiac medications because of high risk of toxicity

B Examples: digitalis; digoxin (Lanoxin)

C Major side effects: diarrhea (local effect), nausea, vomiting (malabsorption of all nutrients); bradycardia (increased vagal tone at AV node)

D Toxicity: premature ventricular complexes (increased spontaneous rate of ventricular depolarization), xanthopsia/yellow vision (effect on visual cones); muscle weakness (central nervous system [CNS] effect, neurotoxicity, hypokalemia), blurred vision (CNS effect), anorexia and vomiting (local effect stimulates chemoreceptor zone in medulla); toxicity treated with digoxin immune Fab (Digibind)

#### E Nursing care

1. Check apical pulse before administration: withhold dose and contact health care

provider if rate is excessively slow (parameter set by health care provider; usually below 50 to 60 beats/min)

2. Encourage intake of potassium-rich foods unless potassium supplement is prescribed
3. Assess for signs of impending toxicity (e.g., anorexia, nausea, vomiting, dysrhythmias, xanthopsia)
4. Monitor for hypokalemia, which potentiates the effects of digitalis; electrocardiogram (ECG) will indicate depressed T waves with hypokalemia
5. Instruct to count radial pulse and record before each administration; notify health care provider of side effects; report any changes in heart rate or rhythm
6. Digoxin—monitor blood level during therapy (therapeutic serum level: 0.5 to 2.0 ng/mL)

## **Antidysrhythmics**

### **A Description**

1. Treat abnormal variations in cardiac rate and rhythm; also prevent dysrhythmias
2. Available in oral and parenteral (IM, IV) preparations

### **B Examples**

1. Class IA antidysrhythmics: suppress ectopic foci by increasing refractory period and slowing depolarization: disopyramide (Norpace), quinidine preparations (e.g., quinidine sulfate, quinidine polygalacturonate [Cardioquin])
2. Class IB antidysrhythmics: suppress ventricular dysrhythmias by decreasing automaticity and increasing ventricular electrical stimulation threshold; lidocaine, phenytoin (Dilantin)
3. Class IC antidysrhythmics: slow conduction and increase ventricular refractoriness: flecainide (Tambocor)
4. Class II antidysrhythmics (beta blockers or beta-adrenergic blockers): decrease heart rate, contractility, and automaticity by blocking beta-adrenergic receptor sites from catecholamines; decrease myocardial workload and oxygen requirements; indicated for tachydysrhythmias, hypertension, angina; propranolol (Inderal), metoprolol (Lopressor), atenolol (Tenormin), timolol (Blocadren), nadolol (Corgard), sotalol (Betapace)
5. Class III antidysrhythmics: prolong repolarization; amiodarone (Cordarone) for ventricular tachycardia and fibrillation; dofetilide (Tikosyn) and, ibutilide (Corvert) for atrial flutter and fibrillation
6. Class IV antidysrhythmics (calcium channel blockers or calcium antagonists): block calcium influx into muscle cells during depolarization; control atrial dysrhythmias by decreasing cardiac automaticity and impulse conduction; reduce peripheral vascular resistance in treatment of hypertension: diltiazem (Cardizem), NIFEdipine (Procardia), verapamil (Calan), felodipine (Plendil)

**C Major side effects:** hypotension (decreased cardiac output caused by vasodilation); dizziness (hypotension); nausea and vomiting (irritation of gastric mucosa); heart block (direct cardiac toxic effect, cardiac depressant effect); heart failure (decreased contractility); anticholinergic effect (decreased parasympathetic stimulation); blood

dyscrasias (e.g., decreased RBCs, WBCs, and platelet synthesis)

D Toxicity: diarrhea (gastrointestinal [GI] irritation), CNS disturbances (neurotoxicity), sensory disturbances (neurotoxicity)

E Nursing care

1. Assess vital signs during course of therapy; monitor drug blood levels
2. Use cardiac monitoring during IV administration; ensure follow-up ECGs
3. Use infusion-control device for continuous IV administration
4. Administer oral preparations with meals to reduce GI irritation
5. Use safety precautions (e.g., recumbent position, supervised ambulation, side rails) when CNS effects are manifested
6. Instruct to notify health care provider of side effects (e.g., changes in heart rate or rhythm, fatigue, weight gain, bleeding)
7. Instruct to change positions slowly; increase fiber and fluid intake to prevent constipation
8. Use caution when administering beta blockers to clients with diabetes (may mask signs of hypoglycemia), bronchospasms, or heart failure

## **Cardiac Stimulants**

A Description

1. Increase heart rate
2. Act by either indirect or direct mechanisms affecting autonomic nervous system
3. Available in parenteral (IM, IV), endotracheal, and intracardiac preparations

B Examples

1. Atropine (atropine sulfate): suppresses parasympathetic nervous system control at SA and AV nodes by reducing vagal stimulation, thus allowing heart rate to increase
2. EpiNEPHrine (Adrenalin): stimulates rate and force of cardiac contraction via sympathetic nervous system

C Major side effects: tachycardia (sympathetic stimulation); headache (dilation of cerebral vessels); CNS stimulation (sympathetic stimulation); cardiac dysrhythmias (cardiovascular system stimulation); atropine causes anticholinergic effects resulting from decreased parasympathetic stimulation (e.g., dry mouth, blurred vision, urinary retention)

D Nursing care

1. Assess vital signs during course of therapy
2. Use cardiac monitoring during IV administration
3. Ensure follow-up ECGs

## **Coronary Vasodilators**

A Description

1. Decrease cardiac workload and myocardial oxygen requirements by vasodilatory action that decreases preload and afterload
2. Nitrates act directly at receptors in smooth muscles, causing vasodilation, which

decreases preload, thus decreasing cardiac workload

3. Calcium channel blockers inhibit influx of calcium ions across cell membranes during depolarization of cardiac and vascular smooth muscle
4. Effective in treatment of angina pectoris
5. Available in oral, sublingual tablets and spray, sustained-release buccal, topical (including transdermal), and IV preparations

#### B Examples

1. Nitrates (sublingual): nitroglycerin, isosorbide dinitrate (Isordil, Sorbitrate)
2. Nitrates (oral): isosorbide dinitrate (Isordil, Sorbitrate)
3. Nitrates (topical)
  - a. Nitroglycerin ointment (Nitro-Bid; Nitrol)
  - b. Nitroglycerin transdermal (Nitro-Dur; Transderm-Nitro)
4. Nitrates (IV): nitroglycerin (Nitro-Bid IV, Tridil); nitroprusside (Nitropress)
5. Calcium channel blockers: see Class IV antidysrhythmics
6. Human B-type natriuretic peptide: nesiritide (Natrekor)

C Major side effects: headache (dilation of cerebral vessels); flushing (peripheral vasodilation); orthostatic hypotension (loss of compensatory vasoconstriction with position change); tachycardia (reflex reaction to severe hypotension); dizziness (orthostatic hypotension)

#### D Nursing care

1. Assess for hypotension before administering; if present, withhold drug
2. Encourage to change positions slowly and remain seated after taking sublingual nitroglycerin to avoid orthostatic hypotension
3. Instruct to take sublingual nitroglycerin preparations before angina-producing activities; for chest pain take sublingual preparations every 5 minutes, not to exceed three in 15 minutes; obtain emergency care if pain persists
4. Store in original amber glass container; avoid placing in heat, light, moisture, or plastic
5. Explain that slight stinging, burning, or tingling under the tongue indicates potency of drug; obtain a new supply every 3 months
6. Wear clean gloves when administering topical preparation to prevent absorption through fingers
7. Use glass container and tubing supplied by manufacturer when administering IV nitroglycerin preparations; standard tubing can absorb nitroglycerin; titrate using an infusion control pump; monitor BP every 5 to 15 minutes

## **Antihypertensives**

#### A Description

##### 1. Actions

- a. Promote dilation of peripheral blood vessels, thus decreasing BP, peripheral vascular resistance, and afterload
- b. Reduce cardiac contractility
- c. Reduce volume

2. Available in oral, parenteral (IM, IV), and transdermal preparations

## B Examples

1. Angiotensin-converting enzyme inhibitors (ACEIs): stop conversion of angiotensin I to II, blocking vasoconstriction and fluid retention from aldosterone secretion; captopril (Capoten), enalapril (Vasotec), benazepril (Lotensin), lisinopril (Prinivil, Zestril), quinapril (Accupril), fosinopril (Monopril)
2. Angiotensin II receptor blockers (ARBs): block angiotensin II from binding to specific vascular smooth muscle and adrenal gland receptor sites; stop vasoconstriction and fluid retention; similar antihypertensive effect of ACEIs but less likely to cause chronic cough: candesartan (Atacand), irbesartan (Avapro), losartan (Cozaar), valsartan (Diovan)
3. Calcium channel blockers (see Class IV antidysrhythmics)
4. Diuretics (see [Diuretics](#))
5. Beta blockers (see Class II antidysrhythmics)
6. Alpha<sub>1</sub> blockers: inhibit effects of norepinephrine by blocking receptors that control vasomotor tone; doxazosin (Cardura), prazosin (Minipress), terazosin (Hytrin)
7. Alpha-beta blockers: combine effects of alpha<sub>1</sub> and beta blockers, leading to vasodilation, decreased contractility, and decreased heart rate; labetalol (Normodyne), carvedilol (Coreg)
8. Central alpha<sub>2</sub> agonists: decrease sympathetic activity from CNS; clonidine (Catapres), methyldopa (Aldomet)
9. Direct vasodilators: relax smooth muscles of arterioles, resulting in decreased peripheral vascular resistance; hydrALAZINE (Apresoline), minoxidil (Loniten), nitroprusside (Nitropress), diazoxide (Hyperstat IV)

## C Major side effects

1. Orthostatic hypotension (loss of compensatory vasoconstriction with position change)
2. Dizziness (orthostatic hypotension); drowsiness (cerebral hypoxia)
3. Cardiac rate alteration: bradycardia caused by sympatholytics (decreased sympathetic stimulation to heart); tachycardia caused by direct relaxers (reflex reaction to severe hypotension)
4. Sexual disturbances (failure of erection or ejaculation caused by loss of vascular tone)
5. Blood dyscrasias (hemolytic anemia, decreased WBCs, decreased platelet synthesis)
6. Beta blockers can cause bronchospasm and mask hypoglycemia
7. ACEIs may cause a dry cough; small percentage may develop life-threatening angioedema
8. Calcium channel blockers may cause leg edema

## D Nursing care

1. Assess vital signs, especially pulse rate; monitor BP in standing and supine positions; ensure systolic pressure is maintained at greater than 80 mm Hg
2. Monitor urinary output during initial titration
3. Protect nitroprusside IV solution from light during administration
4. Instruct to follow a low-sodium diet; eat foods high in B-complex vitamins
5. Inform to continue taking medication as prescribed because therapy usually is life-long and abrupt cessation may lead to rebound hypertension

6. Teach to avoid engaging in hazardous activities when initially taking antihypertensives; change positions slowly
7. Teach to report side effects; report significant weight loss because dose may need to be adjusted

## ***Diuretics***

### A Description

1. Interfere with sodium reabsorption in kidney
2. Increase urine output, which reduces hypervolemia; decrease preload and afterload
3. Available in oral and parenteral preparations

### B Examples

1. Thiazides: interfere with sodium ion transport at loop of Henle and inhibit carbonic anhydrase activity at distal tubule sites; chlorothiazide (Diuril); hydrochlorothiazide (HCTZ, HydroDIURIL); metolazone (Zaroxolyn) which is a thiazide-like diuretic
2. Potassium-sparers: interfere with aldosterone-induced reabsorption of sodium ions at distal nephron sites to increase sodium chloride excretion and decrease potassium ion loss; spironolactone (Aldactone), triamterene (Dyrenium), amiloride (Midamor)
3. Loop diuretics: interfere with active transport of sodium ions in loop of Henle and inhibit sodium chloride and water reabsorption at proximal tubule sites; may be given IV; furosemide (Lasix), bumetanide (Bumex), and torsemide (Demadex)

C Major side effects: GI irritation (local effect); hyponatremia (inhibition of sodium reabsorption at the kidney tubule); orthostatic hypotension (reduced blood volume); hyperuricemia (partial blockage of uric acid excretion); dehydration (excessive sodium and water loss); hyperglycemia; furosemide (Lasix) may cause hearing problems when administered rapidly

1. All diuretics except potassium-sparers: hypokalemia (increased potassium excretion); increased urinary excretion of magnesium and zinc
2. Potassium-sparers: hyperkalemia (reabsorption of potassium at kidney tubule); hypomagnesemia (increased excretion of magnesium at kidney tubule); hypocalcemia (increased urinary excretion of calcium)
3. Furosemide (Lasix) competes with aspirin for renal excretion sites and may cause aspirin (ASA) toxicity
4. Thiazides and loop diuretics may cause hyperglycemia in clients with diabetes

### D Nursing care

1. Monitor intake and output (I&O); weigh daily (same time, scale, clothing); assess for signs of fluid-electrolyte imbalance
2. Administer in the morning so that maximal effect occurs during waking hours
3. Monitor pulse rate and BP; instruct to change position slowly
4. Encourage intake of foods high in calcium, magnesium, zinc, and potassium (except if taking potassium-sparers)
5. Monitor serum electrolytes and glucose levels

## ***Medications to Manage Hypotension in Shock***

## A Description

1. Constrict peripheral blood vessels and/or increase cardiac output through alpha- and beta-adrenergic stimulation
2. Elevate BP
3. Available in parenteral (IV) preparations

B Examples: norepinephrine (Levophed), phenylephrine (Neo-Synephrine), DOPamine (Intropin), DOBUTamine (Dobutrex); vasopressin (Pitressin) in high doses is a nonadrenergic vasoconstrictor

C Major side effects: hypertension (compression of cerebral blood vessels); headache (increase in BP); GI disturbance (autonomic dysfunction)

## D Nursing care

1. Assess vital signs; monitor BP frequently; titrate IV depending on BP readings to prevent hypertension
2. Assess for IV infiltration; may lead to tissue necrosis; use infusion control pump
3. Monitor peripheral circulation and urinary output

## **Anticoagulants**

### A Description

1. Prevent fibrin formation by interfering with production of various clotting factors in the coagulation process
2. Prevent platelet aggregation and clot extension
3. Used for prevention and treatment of thrombus and embolus
4. Available in oral and parenteral (subcutaneous [Sub-Q], IV) preparations; may be given concurrently until oral medication reaches therapeutic level

### B Examples

1. Heparin sodium: administered IV or Sub-Q
2. Low-molecular-weight heparin administered Sub-Q: enoxaparin (Lovenox), dalteparin (Fragmin), fondaparinux (Arixtra)
3. Dabigatran (Pradaxa); a direct thrombin inhibitor; benefit is routine blood coagulation studies are unnecessary
4. Lepirudin (Refludan) administered IV; indicated for clients who have heparin-induced thrombocytopenia (HIT)
5. Warfarin (Coumadin) administered orally
6. Antiplatelet drugs administered orally: ASA, ticlopidine (Ticlid), clopidogrel (Plavix)

C Major side effects: fever, chills, bronchospasm (hypersensitivity); skin rash (hypersensitivity); petechiae, bruising, hemorrhage (interference with clotting mechanisms); diarrhea (GI irritation); thrombocytopenia and other blood dyscrasias; ASA may cause tinnitus and hearing loss

### D Nursing care

1. Monitor blood work when client is receiving warfarin (Coumadin)
  - a. Platelets
  - b. International normalized ratio (INR): therapeutic value should be 2.0 to 3.5; change in drug regimen requires more frequent INRs because many drugs have

interactive effects

2. Monitor blood work when client is receiving heparin derivatives
  - a. Platelets
  - b. Prothrombin time (PT); therapeutic value should be 1.5 to 2 times the normal value
  - c. Activated partial thromboplastin time (aPTT); therapeutic value should be 1.5 to 2 times normal value when given as a continuous IV drip
3. Monitor blood work if surgery cannot be delayed when client is receiving dabigatran (Pradaxa) to evaluate bleeding risk
  - a. Ecarin clotting time (ECT)
  - b. Activated thromboplastin time (aPTT)
  - c. Thrombin time (TT)
4. Administer subcutaneous heparin in the abdomen; do not aspirate or massage the area
5. Have appropriate antidote available: vitamin K for warfarin; protamine sulfate for heparin
6. Assess for signs of bleeding
7. Avoid intramuscular injections and salicylates with the concomitant administration of anticoagulants to prevent bleeding
8. Instruct to carry a medical alert card; immediately report signs of bleeding or injury; avoid alcohol and medications containing aspirin
9. Instruct to avoid interacting herbal supplements (e.g., garlic, ginseng, green tea, and St. John's wort); avoid excessive intake of dietary sources of vitamin K and cranberry juice when taking warfarin sodium
10. Maintain safety precautions (e.g., use electric razor and soft toothbrush) to prevent bleeding
11. Follow schedule for coagulation studies; may be daily, weekly, monthly, or every 3 months

## ***Thrombolytics (Fibrinolytics)***

### **A Description**

1. Convert plasminogen to plasmin, which initiates local fibrinolysis
2. Dissolve occluding thrombi
3. Administered intravenously or intraarterially
4. Initial loading dose is administered concomitantly with heparin
5. Therapy must be instituted within hours of the onset of myocardial infarction, pulmonary embolism, or acute ischemic brain attack

**B Examples:** streptokinase (Streptase); tissue plasminogen activator (t-PA) such as alteplase (Activase)

**C Major side effects:** bleeding, especially GI if there is a history of peptic ulcer disease or cerebral if there is a history of uncontrolled hypertension (increased fibrinolytic activity); allergic reactions (introduction of a foreign protein); low-grade fever (resulting from absorption of infarcted tissue); reperfusion dysrhythmias

## D Nursing care

1. Screen clients for contraindications and complete all venipuncture procedures before initiating therapy; observe for signs of bleeding; monitor PTT and fibrinogen concentration; monitor vital signs and neurologic status
2. Assess for signs of allergic reactions such as chills, urticaria, pruritus, rash, and malaise
3. Keep aminocaproic acid (Amicar), a fibrinolysis inhibitor, available
4. Maintain continuous IV infusion of heparin after thrombolytic therapy

## **Antianemics**

### A Description

1. Promote RBC production; effective in treatment of anemia caused by chronic kidney disease or chemotherapy, iron deficiency anemia, and inadequate nutrition
2. Colony-stimulating factors stimulate red blood cell production; iron-containing compounds and vitamin replacements needed for the formation of RBCs
3. Available in oral and parenteral (IM, IV, Sub-Q) preparations

### B Examples

1. Colony-stimulating factors: epoetin (Epogen, Procrit) administered Sub-Q or IV three times a week
2. Iron compounds: oral—ferrous gluconate, ferrous sulfate; parenteral—iron dextran
3. Vitamin replacements: cyanocobalamin—vitamin B<sub>12</sub>, folic acid—vitamin B<sub>9</sub>

### C Major side effects

1. Epoetin: seizures, hypertension, thrombotic events
2. Iron replacements: nausea, vomiting (irritation of gastric mucosa); constipation (delayed passage of iron and stool); black stools (presence of unabsorbed iron in stool); stained teeth (liquid preparations that come into contact with enamel); tissue staining (injectable preparations that leak iron into tissue)
3. Vitamin replacements: local irritation (tissue effect at injection site or in mouth); allergic reactions, anaphylaxis (hypersensitivity); diarrhea (GI irritation)

## D Nursing care

### 1. Epoetin

- a. Monitor BP, hematocrit, patency of dialysis shunt if present
- b. Institute seizure precautions if there is a precipitous rise in hematocrit level
- c. Do not shake vial, which may inactivate drug

### 2. Iron replacements

- a. Inform about side effects of therapy
- b. Teach to take liquid preparations diluted with water or fruit juice through a straw on an empty stomach, if possible, for optimum absorption; take ascorbic acid (vitamin C) concurrently because it increases iron absorption; encourage oral hygiene after iron administration to prevent staining of teeth and irritation of oral mucosa
- c. Encourage intake of foods high in iron, vitamin B<sub>12</sub>, and folic acid; increase high-

fiber foods to reduce potential of constipation

d. Have available deferoxamine (Desferal), the antidote for iron toxicity

### 3. Vitamin replacements

a. Vitamin B<sub>12</sub>: inform that it cannot be taken orally; use Z-track method for IM injection; therapy is life-long for pernicious anemia

b. Folic acid: instruct about dietary sources of folic acid (e.g., fresh fruits, vegetables, and meats)

## **Antilipidemics**

### A Description

1. Improve lipid profile by reducing cholesterol or triglyceride synthesis and/or increasing high-density lipoprotein (HDL) level

2. Used to attain recommended goals for low-density lipoprotein (LDL) levels established by the National Cholesterol Education Program's (NCEP) Adult Treatment Panel (ATP III) (ATP IV will be available in fall 2011)

a. Clients with coronary heart disease: less than 100 mg/dL with optional lower goal of less than 70 mg/dL

b. Clients with two or more risk factors: less than 130 mg/dL with optional lower goal of less than 100 mg/dL

c. Clients with zero to one risk factor: less than 160 mg/dL

### B Examples

1. HMG-CoA reductase inhibitors (statins): lower levels of total cholesterol, LDL, and triglycerides; increase HDL levels; pravastatin (Pravachol), lovastatin (Mevacor), simvastatin (Zocor); atorvastatin (Lipitor)

2. Fibrates: decrease levels of total cholesterol, LDL, and triglycerides; gemfibrozil (Lopid), fenofibrate (Tricor)

3. Bile acid sequestrants: bind with intestinal bile, preventing absorption and lowering LDL and total cholesterol levels; cholestyramine (Questran), colestipol (Colestid)

4. Nicotinic acid reduces levels of total cholesterol, triglycerides, and LDL; increases HDL levels

### C Major side effects

1. Nausea, vomiting, diarrhea (GI irritation)

2. Musculoskeletal disturbances (direct musculoskeletal tissue effect)

3. Hepatic disturbances (hepatic toxicity)

4. Reduced absorption of fat and fat-soluble vitamins (A, D, E, K) as well as vitamin B<sub>12</sub> and iron

5. Statins: rhabdomyolysis (potentially fatal skeletal muscle disease)

6. Bile acid sequestrants: constipation

7. Nicotinic acid (niacin): facial flushing

### D Nursing care

1. Encourage adherence to dietary program

a. Low cholesterol, low fat (especially saturated)

- b. Replace vegetable oils high in polyunsaturated fatty acid with those high in monounsaturated fatty acid (e.g., olive oil, canola oil)
  - c. Eat fish high in omega-3 fatty acids several times per week (e.g., salmon, tuna, halibut)
  - d. Increase intake of high-fiber foods (e.g., fruits, vegetables, cereal grains, legumes); soluble fibers (e.g., oat, bran, legumes) are particularly effective in reducing blood lipid levels
2. Instruct to take medications with meals to reduce GI irritation; take statins at hour of sleep to enhance effectiveness
  3. Provide schedule for monitoring blood work: liver function tests, serum cholesterol, LDL, HDL, triglycerides, hemoglobin, RBCs, and fat-soluble vitamin levels
  4. Cholestyramine: mix with full glass of liquid; incorporate measures to prevent constipation
  5. Simvastatin (Zocor): teratogenic
  6. Lovastatin and gemfibrozil: assess for visual disturbances with prolonged use
  7. Statins: instruct to report muscle pain, fever, and dark urine, which are signs of rhabdomyolysis; monitor creatine kinase (CK) level

## ***Phosphodiesterase Inhibitors***

### A Description

1. Inhibit cyclic adenosine monophosphate phosphodiesterase, leading to increased levels of adenosine monophosphate within the cells
2. Increase cardiac contractility (inotropic effect) and cardiac output
3. Cause vasodilation, decreasing peripheral vascular resistance, preload, and afterload
4. Used for short-term treatment of heart failure; administered IV

B Examples: inamrinone (Inocor), milrinone (Primacor)

C Major side effects: hypotension, dysrhythmias, nephrogenic diabetes insipidus, hepatotoxicity, anorexia, abdominal cramps, thrombocytopenia; overdose can cause death

### D Nursing care

1. Monitor for therapeutic effects: decreased pulmonary capillary wedge pressure (PCWP), resolution of clinical indicators of heart failure (e.g., daily weights, I&O, breath sounds)
2. Monitor BP and cardiac rhythm
3. Use infusion control pump to administer; consult with health care provider for titration based on clinical indicators
4. Monitor potassium levels, which may be low secondary to diuresis; administer supplements as needed

## **Related Procedures**

### ***Angiography (Arteriogram)***

**A Definition:** x-ray examination using contrast agent to visualize patency of arteries; may be performed using computed tomography (CT) with contrast or magnetic resonance imaging (MRI)

**B Nursing care**

1. Assess for iodine or shellfish allergy and adequate kidney function to excrete dye; hydration and n-acetylcysteine (Mucomyst) may be administered if there is reduced renal function
2. Inform about risks (e.g., allergic reaction, bleeding, embolus, cardiac dysrhythmia) and to expect sensation of warmth as contrast agent is injected
3. Administer prescribed sedative before procedure
4. Monitor for indicators of an allergic response such as dyspnea and diaphoresis; be prepared to administer steroids, antihistamines, and epinephrine
5. Postprocedure: check injection site for bleeding and inflammation; maintain pressure over insertion site; assess circulatory status of extremities; maintain bed rest; provide hydration; monitor urinary output

## **Angioplasty**

**A Definition**

1. Percutaneous coronary intervention (PCI) or transluminal coronary angioplasty (PTCA): introduction of a balloon-tipped catheter into coronary artery to the stenosis to reduce or eliminate occlusion by the atheroma (plaque)
  - a. Performed via coronary catheterization; heparin infusion used to prevent thrombus formation
  - b. Thrombolytic therapy may be combined with PCI in some situations
  - c. Stents, which are mesh structural supports, may be inserted to maintain patency; requires long-term anticoagulation therapy after insertion
  - d. Calcified lesions that cannot be removed by PTCA require an atherectomy, which mechanically removes plaque by shaving and retrieving it from the vessel's lumen
  - e. Complications include arterial spasm or perforation and thrombus formation; emergency open heart surgery may be necessary; vessel occlusion may occur as a result of cellular response to procedure
2. Percutaneous angioplasty also is used to dilate stenotic vessels by stretching the artery wall away from the plaque; used in aorta, iliac, femoral, popliteal, tibial, and renal vessels and arteriovenous dialysis shunts; stent placement generally follows procedure

**B Nursing care:** see care for Cardiac Catheterization; administer prescribed vasoactive drugs such as calcium channel blockers and nitroglycerin before, during, and after this procedure; monitor for angina, dysrhythmias, bleeding, and evidence of restenosis and reocclusion

## **Blood Transfusion**

**A Purpose:** restores blood volume after hemorrhage; maintains hemoglobin levels in clients with severe anemia; replaces specific blood components

## B Sources of blood for transfusion

1. Homologous: random collection of blood by volunteer donors
2. Autologous: donation of a client's own blood before hospitalization; possible when donor's hemoglobin remains higher than 11 g/dL; donations can be saved for 5 weeks
3. Directed donation: donation of blood by a donor for a specific client
4. Blood salvage: client's blood is suctioned from a closed body cavity (e.g., operative site, trauma site, joint) into a cell-saver machine, processed, and transfused back into the client; must be used within 6 hours of collection; contains high levels of potassium

## C Blood components and use

1. Whole blood: volume replacement for blood loss
2. Packed RBCs: increase RBC mass
3. Platelets: increase platelets to prevent bleeding related to thrombocytopenia
4. Fresh frozen plasma: contains plasma, antibodies, clotting factors
5. Cryoprecipitate: contains factor VIII, fibrinogen, and factor XIII to treat hemophilia
6. Albumin: volume expander to treat hypoproteinemia
7. Plasma protein factor: to treat some types of hemophilia
8. IV gamma globulin: contains immunoglobulin G (IgG) antibodies to treat immunodeficiency

## D Nursing care

1. Obtain and document informed consent
2. Check that blood or blood components are typed and cross-matched for compatibility; follow agency policy; two nurses should verify blood type, Rh factor, client identification, blood numbers, and expiration date
3. Blood must be administered within 30 minutes of arrival on unit
4. Obtain baseline vital signs before administration and monitor every 5 minutes for 15 minutes and then every 15 minutes during the transfusion
5. Initiate an IV with normal saline infusing through a large-bore catheter and a blood administration set containing a filter; solutions containing glucose should not be used
6. Maintain standard precautions when handling blood and IV equipment; assure client that risk for acquired immunodeficiency syndrome (AIDS) is minimal because blood is screened
7. Invert blood container gently to suspend RBCs within the plasma
8. Administer at appropriate rate
  - a. Platelets, plasma, and cryoprecipitate may be infused rapidly; assess for signs of circulatory overload
  - b. Blood transfusions should be completed within 4 hours because potential for bacterial contamination increases over time
  - c. Administer slowly for first 15 minutes to detect transfusion reaction
  - d. Use IV controller to provide safe infusion rate; ensure that IV controller is appropriate for blood administration
9. Monitor for signs of hemolytic reaction: usually occurs within first 10 to 15 minutes; shivering, headache, flank pain, increased pulse and respiratory rates, hemoglobinuria, oliguria, progressive signs of shock and renal failure

10. Monitor for signs of febrile reaction: usually occurs within 30 minutes; chills, fever, muscle stiffness
11. Monitor for allergic reaction: hives, wheezing, flushing, pruritus, joint pain
12. If reaction occurs: stop infusion immediately; replace IV tubing containing blood; maintain patency of IV tubing with normal saline; monitor vital signs and I&O frequently; send blood to the laboratory; send urine specimen to laboratory if a hemolytic reaction is suspected; evaluate hemoglobin and hematocrit laboratory results; monitor urine output; notify health care provider

## ***Bone Marrow Aspiration***

A Definition: puncture to collect tissue from bone marrow of sternum or iliac crest; performed to study cells involved in blood production

B Nursing care: allay anxiety; explain pain is brief, only occurs during aspiration, and conscious sedation may be used; position to expose site; apply pressure for several minutes after procedure; monitor for signs and symptoms of bleeding and infection

## ***Cardiac Catheterization***

A Definition: introduction of a catheter into heart via a peripheral vessel

1. Injection of contrast material to visualize chambers, coronary circulation, and great vessels
2. Withdrawal of blood samples to evaluate cardiac function
3. Measurement of pressures within chambers and blood vessels (e.g., pulmonary wedge pressure)
4. Electrophysiological (EP) study may be done using a catheter with electrodes to assess certain dysrhythmias and, if needed, treated with ablation to destroy ectopic foci

B Nursing care

1. Precatheterization
  - a. Inform of purpose, possible complications (e.g., hemorrhage, myocardial infarction, brain attack), and sensations it causes (e.g., urge to cough, nausea, heat); allow time for verbalization of fears
  - b. Identify allergies to iodine; assess for adequate urine output; hydration and n-acetylcysteine (Mucomyst) may be administered if there is reduced renal function
  - c. Maintain nothing by mouth (NPO [nil per os]) for 8 to 12 hours before; administer prescribed sedatives
2. Postcatheterization
  - a. Monitor vital signs frequently; cardiac dysrhythmias are more common during procedure but may occur afterward
  - b. Assess puncture site for bleeding; use pressure at insertion site (e.g., commercial hemostatic device, sandbags or ice packs)
  - c. Assess involved extremity for signs of ischemia (e.g., absence of peripheral pulses, changes in sensation, color, and temperature)
  - d. Maintain bed rest for prescribed number of hours; maintain in supine position;

- prevent hip flexion  
e. Increase fluids to eliminate dye

## Cardiac Monitoring

(Figure 6-4: Events of the cardiac cycle)

**FIGURE 6-4** Events of the cardiac cycle. (From Ignatavicius DD, Workman ML: *Medical-surgical nursing: critical thinking for collaborative care*, ed 6, St. Louis, 2010, Saunders.)

### A Definition

1. Electric observation of conductivity patterns of heart using skin electrodes and a monitoring device; heart's electric activity is conducted to skin surface by ionized fluids bathing cells and tissues
2. Used when danger of dysrhythmias is apparent (e.g., heart disease, surgery, invasive procedures)
3. Conduction from SA node through atria causes atrial contraction and gives rise to the P wave; conduction from AV node down bundle of His and bundle branches to Purkinje's fibers, which extend to lateral walls of the ventricles, causes ventricular contraction, which gives rise to the QRS wave; ventricular repolarization is associated with the T wave; late ventricular repolarization is associated with the U wave
4. Holter monitor assesses dysrhythmias by recording cardiac tracings during routine activities throughout a 24-hour period

5. Stress test assesses cardiac conduction and function after being challenged (e.g., treadmill or bicycle exercise, stimulatory medication)

## B Nursing care

1. Explain procedure and attempt to allay anxiety
2. Prepare skin on chest for electrode attachment; cleanse area with alcohol to remove dirt and oils; shave area if necessary
3. Place electrodes on skin and attach to monitor cable as indicated: RA (attach to right upper arm or chest); LA (attach to left upper arm or chest); RL (attach to right leg or lower chest [ground]); LL (attach to left leg or lower chest); turn on monitor scope and set the sensitivity when a clear picture is obtained; set the alarm and readout attachment (if available) to document any change in cardiac activity
4. Identify rhythm and intervene appropriately; intervene immediately when life-threatening dysrhythmias occur because if anoxia lasts for more than 4 minutes, brain damage results
  - a. Normal sinus rhythm (NSR): ventricular and atrial rate of 60 to 100 beats/min; regular rhythm; a P wave (representing atrial depolarization) precedes each QRS complex (representing ventricular depolarization); PR interval (representing conduction of an impulse from the SA node through the AV node) is 0.12 to 0.20 second; T wave after each QRS complex (representing repolarization of the ventricles)
  - b. Sinus bradycardia: same as NSR, but rate less than 60; atropine may be administered if symptomatic
  - c. Sinus tachycardia: same as NSR, but with rate greater than 100; beta blockers, calcium channel blockers may be administered and catheter ablation may be performed if severe
  - d. Premature atrial complexes or beats
    - (1) An ectopic focus fires an impulse before the next sinus impulse is due; a pause follows the premature atrial complex; may cause palpitations; atrial irritability often caused by stress, fatigue, caffeine, nicotine, alcohol
    - (2) Treatment includes elimination of causative agent, antidysrhythmics
  - e. Atrial fibrillation and flutter ([Figure 6-5: Atrial fibrillation](#)):

**FIGURE 6-5** Atrial fibrillation. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

- (1) Results from rapid firing of atrial ectopic foci; not all impulses conducted to ventricles
  - (a) Fibrillation: atrial rate of 300 to 600/min; ECG shows no P waves,

rather irregular forms; pulse deficit is common; danger from blood pooling in quivering atria leads to emboli formation

(b) Flutter: atrial rate of 250 to 400/min, P waves on ECG have saw-tooth appearance

(2) Administer prescribed medications: antidysrhythmics; anticoagulant until rhythm is controlled to reduce risk of brain attack (cerebral vascular accident [CVA]) caused by atrial thrombi; prepare for cardioversion; catheter ablation if dysrhythmia is prolonged

(3) Monitor vital signs, oxygen saturation, and potassium levels

f. First-degree atrioventricular (AV) block: conduction of impulse from atria is slowed; PR interval on ECG is consistent, but greater than 0.20 seconds

g. Second-degree AV block type I (Wenckebach): repeating pattern in which conduction of atrial impulse is progressively prolonged until it is completely blocked; ECG shows increasingly long PR interval until a QRS complex does not follow a P wave

h. Second-degree AV block type II: conduction of atrial impulses is intermittently blocked every second, third, fourth beat, etc.; P waves may precede each QRS complex

i. Third-degree atrioventricular block (complete heart block) ([Figure 6-6: Third-degree heart block](#))

**FIGURE 6-6** Third-degree heart block. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

(1) No electric communication between atria and ventricles and each beat independently; does not provide long-term adequate circulation; syncope, heart failure, or cardiac arrest may ensue

(2) Document dysrhythmia and notify health care provider; administer medications per protocol; prepare for pacemaker insertion (see [Implantable Cardiac Devices under Related Procedures](#))

j. Premature ventricular complexes or beats ([Figure 6-7: Premature ventricular complexes](#))

**FIGURE 6-7** Premature ventricular complexes: normal sinus rhythm with multifocal PVCs. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

- (1) Originate in ventricles and occur before next expected sinus beat; can be life-threatening when they occur close to a T wave because cardiac repolarization is disrupted and ventricular fibrillation may ensue
- (2) Administer medications per protocol; document dysrhythmia and notify health care provider; institute antidysrhythmics as prescribed; monitor vital signs, oxygen saturation, and potassium levels

k. Ventricular tachycardia ([Figure 6-8: Ventricular tachycardia](#))

**FIGURE 6-8** Ventricular tachycardia. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

- (1) Series of three or more bizarre premature ventricular complexes that occur in a regular rhythm; results in decreased cardiac output and may rapidly convert to ventricular fibrillation
- (2) Administer medications per protocol (e.g., amiodarone [Cordarone]); perform cardioversion if medications fail; be prepared to perform defibrillation and cardiopulmonary resuscitation; document dysrhythmia and notify health care provider; prepare for possible implantable cardioverter defibrillator (ICD) insertion; monitor vital signs, provide oxygen

l. Ventricular fibrillation ([Figure 6-9: Ventricular fibrillation](#))

**FIGURE 6-9** Ventricular fibrillation. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

- (1) Repetitive rapid stimulation from ectopic ventricular foci to which ventricles are unable to respond; ventricular contraction is replaced by uncoordinated twitching; circulation ceases and death ensues without treatment; death may be prevented by cardiopulmonary resuscitation (CPR) and defibrillation
- (2) Defibrillate immediately; inject medications per protocol; institute CPR; document dysrhythmia and notify health care provider; monitor oxygen saturation, and potassium levels

m. Cardiac standstill (asystole)

- (1) No cardiac activity (flat line on ECG tracing); terminates in death unless intervention is immediate
- (2) Institute CPR; document dysrhythmia and notify health care provider; cardiac stimulants may be given via IV or intracardiac route; pacemaker insertion may be indicated (see [Implantable Cardiac Devices under Related Procedures](#))

## ***Cardioversion***

A Definition: elective or emergent procedure during which current is administered to the myocardium in a synchronized fashion to depolarize all cells simultaneously, allowing SA node to resume pacemaker function; may be useful in treating tachydysrhythmias, atrial fibrillation, supraventricular tachycardia, and ventricular tachycardia

B Nursing care

1. Obtain informed consent for elective cardioversion
2. Maintain NPO, verify patent IV line, administer oxygen, and have suction available
3. Ensure that no one is touching bed/client when shock is delivered
4. Monitor cardiac status for dysrhythmias for several hours after procedure

## ***Basic Life Support (Cardiopulmonary Resuscitation) by Health Care Providers***

(Recommendation of American Heart Association in collaboration with the International Liaison Committee on Resuscitation [ILCOR], 2010)

A Definition: institution of external cardiac compression and ventilation to promote blood flow to heart and brain; CPR sequence C-A-B (circulation, airway, breathing)

B Nursing care

1. Assess level of consciousness if found unconscious: shake victim's shoulder and shout, "Are you OK?"; if no response, call for help or activate emergency medical services (EMS) system
2. Assess circulation; take no more than 10 seconds to palpate carotid pulse (adults) or brachial pulse (children)
3. Deliver 30 external cardiac compressions initially; ensure that victim is on a firm surface and in the supine position; place heel of hand over lower half of body of

sternum between the nipples, interlock hands, and compress chest; ensure complete recoil between compressions (see [Table 6-1](#) for details concerning compressions and ventilations)

**Table 6-1**

Component	Adults	Children	Infants
Depth of Compressions	At least 2 inches	At least $\frac{1}{3}$ AP diameter About 2 inches	At least $\frac{1}{3}$ AP diameter About $1\frac{1}{2}$ inches
Rate of Compressions	At least 100/minute Rotate health care provider every 2 minutes Minimize interruption to less than 10 seconds		
Ratio of Compressions to Ventilations	30 : 2 (1 or 2 Rescuers)	30 : 2 (Single Rescuer) 15 : 2 (2 Rescuers)	
Ventilations with Advanced Airway Placement	1 Ventilation every 6 to 8 seconds (8 to 10 breaths/minute) Asynchronous with chest compressions About 1 second per breath Visible chest rise		

4. After initial 30 compressions, assess and establish an airway (in less than 10 seconds); use head tilt–chin lift maneuver (jaw thrust without hyperextension of neck if cervical injury is suspected); determine whether air is being exchanged by observing whether chest is moving, listening for whether air can be heard escaping during exhalation, and determining whether air can be felt during exhalation
5. Initiate rescue breathing by giving 2 breaths while maintaining head-tilt or jaw-thrust maneuver and pinching of victim's nostrils; use pocket mask or bag mask if available
6. Maintain ventilation/compression ratio depending on one or two rescuers and before or after advanced airway placement; reassess carotid pulse after first five cycles and then every few minutes
7. Defibrillate using AED (automated external defibrillator); part of basic life support (BLS) for health care providers; minimize interruptions before and after shock; resume with compressions first
8. Place in recovery position if pulse and respirations resume; continue to monitor breathing regularly
9. Terminate CPR as indicated: return of cardiac rhythm and spontaneous respirations; rescuer exhaustion; health care provider-ordered cessation
10. Hands only CPR recommended for non–health care providers: activate EMS system

and begin chest compressions “fast and hard” in the center of the chest (100 compressions per minute; depress chest 2 inches)

## ***Implantable Cardiac Devices (Pacemaker, Implantable Cardiac Defibrillator)***

### **A Definition**

1. Pacemakers involve insertion of electrodes into the heart; electrodes are attached to an electronic pulse generator that replaces natural electric stimulation of the heart (SA node) to treat symptomatic bradycardia; biventricular pacing may be used for advanced heart failure
  - a. May be temporary and applied externally or may be permanent and surgically placed under skin
  - b. On-demand pacing: pacemaker stimulates heart to contract only if the ventricular rate falls below a preset rate; most frequently used
  - c. Fixed (asynchronous) pacing: pacemaker is set at a constant rate independent of the intrinsic rhythm
  - d. Number of leads and parts of heart stimulated depend on client’s status and needs
  - e. Universal code using letters indicates details about pacemaker: chambers being paced; chambers being sensed; pacemaker response to sensing; programmability; antitachycardia/defibrillation capability
2. Implantable cardioverter defibrillator (ICD): in addition to the functions of a pacemaker, an ICD has the ability to sense life-threatening dysrhythmias, such as ventricular tachycardia or fibrillation, and deliver an electrical impulse (shock) to restore a normal rhythm

### **B Nursing care**

1. Observe cardiac monitor before, during, and after procedure to verify pacemaker capture (QRS following pacemaker spike) and observe for dysrhythmias; note stimulation threshold; have emergency medications (e.g., lidocaine, atropine sulfate) available, as well as a defibrillator; ensure electrical equipment is grounded; monitor incision for hematoma and infection
2. Teach how to measure pulse rate, to keep a diary of pulse rates and discharges of ICD, to notify health care provider immediately if rate falls below that set on pacemaker, to remain under a health care provider’s supervision because batteries must be replaced periodically; pacemaker function may be checked by special telephone devices
3. Encourage to wear a medical identification tag
4. Teach to avoid high-magnetic fields, hand-held screening devices, and MRI; to request hand searches at security gates (device may trigger airport or store alarms, but generally will not be affected); keep cell phone away from device
5. Explain that if ICD administers shock, others in physical contact with client may feel it, but will not be harmed

## ***Nuclear Medicine Procedures***

A Multiple-gated angiographic radioisotope (MUGA) scan or equilibrium radionuclide angiocardiology (ERNA)

1. Noninvasive test using computer and scintillation camera to study ventricular wall motion
2. Volume of blood pumped during one ventricular contraction is compared with total volume in left ventricle, which yields an ejection fraction
3. Ejection fraction gives important information on ventricular size and wall motion abnormalities

B Myocardial perfusion imaging

1. Intravenous injection of a radioisotope, such as thallium or technetium-99m (TC-99m), which is taken up by heart muscle
2. Damaged myocardial tissue absorbs isotope more slowly and retains it for a longer period
3. Isotope can be injected during and after exercise to determine myocardial perfusion

C Positron emission tomography (PET) scan

1. Positron-emitting isotope is administered intravenously to study patency of vessels
2. Provides detailed information about cardiac circulation
3. Specific nursing care: encourage fluid intake after test to facilitate excretion of isotope

D Magnetic resonance imaging (MRI)

1. Powerful magnetic field and computer generate images of heart and large blood vessels
2. Noninvasive and painless; clients with claustrophobia may require sedation for traditional closed MRIs
3. Contraindicated for clients with pacemaker or metal implants
4. Specific nursing care: remove all jewelry, transdermal patches that contain an aluminumized layer, and equipment (e.g., IV infusion devices, oxygen tank, portable ECG monitor) from room; instruct client to lie still and be prepared to expect an intermittent thumping sound

E General nursing care

1. Review routine medications because some may affect results (e.g., beta blockers)
2. Monitor vital signs before and after test
3. Determine history of allergies and notify radiologist before test
4. Offer emotional support because of apprehension about test and results; allay fears about use of radioactive substances

## ***Hemodynamic Monitoring with Pulmonary Artery Catheter***

A Definition: catheter used to measure pulmonary capillary wedge pressure (PCWP), pulmonary artery pressure (PAP), and right atrial pressure (central venous pressure)

1. Double-lumen or triple-lumen catheter with balloon tip is inserted into a vein and advanced through superior vena cava into right atrium and ventricle, then into pulmonary artery; after balloon is inflated, it is guided further into a distal arterial branch, where it wedges
2. Catheter yields information on circulatory status, left ventricular pumping action,

filling pressures, and vascular tone

## B Nursing care

1. Assist health care provider with catheter insertion into jugular or subclavian vein using sterile technique; obtain chest x-ray to check for placement and complication of pneumothorax
2. Observe insertion site for inflammation
3. Monitor line for patency and air bubbles
4. Take readings with client in supine position if possible with transducer at level of phlebostatic axis (intersection of horizontal line extending from sternal border of fourth intercostal space and midaxillary line) and compare with expected values
  - a. Pulmonary capillary occlusive or wedge pressure: 4 to 12 mm Hg
  - b. Pulmonary artery pressure: systolic—16 to 30 mm Hg; diastolic—8 to 12 mm Hg; mean—15 mm Hg
  - c. Central venous pressure (CVP) or right atrial pressure: 2 to 6 mm Hg; less than 2 mm Hg suggests low blood volume; greater than 6 mm Hg suggests fluid overload
5. Change sterile dressing as per policy
6. Notify health care provider if waveform changes or pressure readings are altered
7. Ensure balloon does not remain inflated after wedge pressure determination
8. Continue to monitor noninvasive indicators of hemodynamic status (e.g., BP mean arterial pressure, jugular vein distension)
9. Keep emergency medications and a defibrillator available

# Major Disorders of the Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

## Hypertension

### *Data Base*

#### A Etiology and pathophysiology

1. Etiology is complex; begins insidiously; changes in arteriolar bed cause increased resistance; increased blood volume may result from hormonal or renal dysfunction; arteriolar thickening causes increased peripheral vascular resistance; abnormal renin release constricts arterioles
  - a. 90% to 95% have an unidentifiable cause (essential or primary hypertension); multiple factors such as the renin-angiotensin-aldosterone mechanism, sympathetic nervous system activity, and insulin resistance may be involved
  - b. 5% to 10% have identifiable causes (secondary hypertension); pathophysiology is related to condition causing the rise in pressure; conditions include renovascular disease; primary hyperaldosteronism; Cushing's syndrome; diabetes mellitus; neurologic disorders; dysfunction of thyroid, pituitary, or parathyroid glands; coarctation of the aorta; and pregnancy
2. Risk factors
  - a. Stress
  - b. Abdominal obesity
  - c. Diet: high sodium, low calcium, low magnesium, and low potassium
  - d. Substance abuse (e.g., cigarettes, alcohol, cocaine)
  - e. Family history
  - f. Increasing age
  - g. Sedentary lifestyle
  - h. Hyperlipidemia: increased LDL and cholesterol levels, decreased HDL level
  - i. African-American heritage
  - j. Type 2 diabetes
  - k. Renal disorders
3. Often asymptomatic; diagnosis requires three assessments of elevated BP on separate occasions
4. Classification of BP by the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC 7) (JNC 8 will be available summer 2011)
  - a. Normal: systolic less than 120 mm Hg and diastolic less than 80 mm Hg
  - b. Prehypertension: systolic 120 to 139 mm Hg or diastolic 80 to 89 mm Hg
  - c. Stage 1 hypertension: systolic 140 to 159 mm Hg or diastolic 90 to 99 mm Hg
  - d. Stage 2 hypertension: systolic 160 mm Hg or more, or diastolic 100 mm Hg or more
5. Hypertension increases risk for coronary artery disease, heart failure, myocardial

infarction, brain attacks (CVAs), retinopathy, and nephropathy

## B Clinical findings

1. Subjective: headache (occipital area); light-headedness; tinnitus; easy fatigue; visual disturbances; palpitations
2. Objective: BP more than 140/90 mm Hg obtained on three separate occasions; retinal changes; renal pathology (e.g., azotemia); epistaxis; cardiac hypertrophy

## C Therapeutic interventions

1. Lifestyle modifications recommended by JNC 7 (JNC 8 will be available summer 2011)
  - a. Weight control or reduction to attain a body mass index of 18.5 to 24.9 kg/m<sup>2</sup>
  - b. Dietary Approaches to Stop Hypertension (DASH) eating plan: increased fruits, vegetables, and low-fat dairy products that are rich in calcium and potassium
  - c. Sodium restriction (less than 2.4 g daily)
  - d. Aerobic exercise at least 30 minutes on most days
  - e. Alcohol moderation (no more than one drink daily for women, two for men)
2. Drug therapy recommended by JNC 7 (JNC 8 will be available summer 2011)
  - a. Prehypertension: only for compelling indications
  - b. Stage 1 hypertension: thiazide diuretics for most; may consider ACEIs, ARBs, CCBs, BBs (see [Antihypertensives under Related Pharmacology](#))
  - c. Stage 2 hypertension: second drug added to thiazide diuretic for most
3. Other interventions: smoking cessation, relaxation modalities such as biofeedback and imagery; antianxiety agent

## ***Nursing Care of Clients with Hypertension***

### **Assessment/Analysis**

1. Vital signs in both upright and recumbent positions; use appropriate cuff (width should be 40% of the arm's circumference); avoid errors of parallax when reading sphygmomanometer
2. Baseline weight
3. Presence of risk factors and clinical evidence of target organ damage

### **Planning/Implementation**

1. Monitor levels of electrolytes, blood urea nitrogen (BUN), creatinine, lipid profile, and urine for protein
2. Encourage weight reduction if indicated; weigh daily to monitor fluid balance when there is threat of heart failure
3. Teach to monitor own BP; a BP of 180/120 mm Hg or higher represents a hypertensive emergency; advise to change position slowly and avoid hot showers to prevent orthostatic hypotension when taking antihypertensives
4. Support expression of emotions; encourage relaxation techniques
5. Reinforce that hypertension is not cured, but controlled
6. Educate client and family regarding drugs (see [Antihypertensives under Related](#)

**Pharmacology**), follow-up care, activity restrictions, smoking cessation, limiting alcohol intake, and diet; note that many salt substitutes contain potassium chloride rather than sodium chloride and may be permitted by health care provider if there is no renal impairment; caution about use of nonsteroidal antiinflammatory drugs (NSAIDs), which can cause hypertension

## **Evaluation/Outcomes**

1. Maintains BP at an acceptable level
2. Adheres to therapeutic regimen
3. Verbalizes need for stress reduction

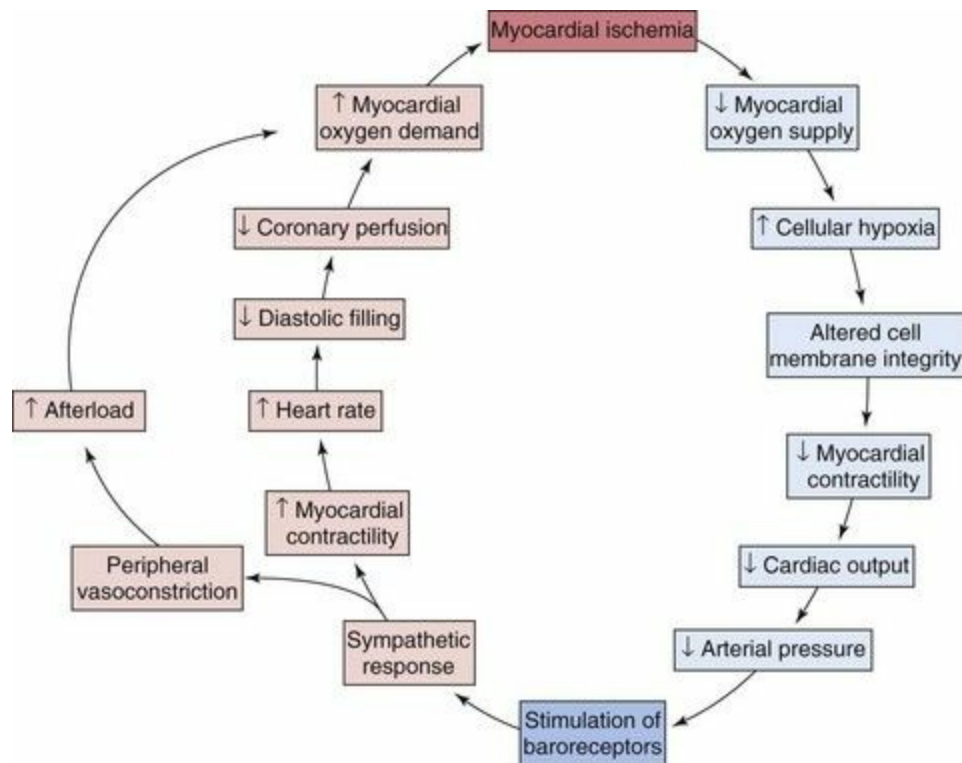

## **Coronary Artery Disease (CAD): Ischemic Heart Disease (IHD), Coronary Heart Disease (CHD), Atherosclerosis, Angina Pectoris, Myocardial Infarction (MI)**

### **Data Base**

A Etiology and pathophysiology

1. Coronary atherosclerosis: deposition of fatty plaques along inner wall of coronary arteries leads to inflammation; macrophages infiltrate endothelium, causing further damage and development of atheromas (fibrous caps over fatty deposits); narrowing and possible obstruction occur; also affects peripheral and cerebral vessels
2. Angina pectoris: episodic pain experienced when the blood oxygen level cannot meet metabolic demands of muscles. In addition to atherosclerosis, this temporary ischemia may be precipitated by coronary artery spasms, strenuous exercise, heavy meals, hyperthyroidism, exposure to cold, and emotional stress; classified as stable, unstable (preinfarction), intractable, variant (Prinzmetal)
3. Myocardial infarction (MI): acute necrosis of heart muscle caused by interruption of oxygen supply to the area (ischemia), resulting in altered function and reduced cardiac output ([Figure 6-10](#): Effects of prolonged myocardial ischemia)

**FIGURE 6-10** Effects of prolonged myocardial ischemia. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

#### 4. Risk factors

- a. Family history
- b. Increasing age, particularly women
- c. Gender: men; women, especially after menopause (estrogen seems to provide some protection)
- d. Race; risk appears higher in African-Americans
- e. Cigarette smoking contributes to vasoconstriction, platelet activation, arterial smooth muscle cell proliferation, and reduced oxygen availability
- f. Hypertension; widened QRS complex (bundle branch block)
- g. Hyperlipidemia: increased total cholesterol; increased LDL (high: 130 to 150 mg/dL; very high: 160 mg/dL or more); increased ratio of total cholesterol or LDL to HDL; low HDL (less than 40 mg/dL); HDL greater than 60 mg/dL seems to help protect against coronary artery disease (CAD); increased triglycerides (high: 200 to 499 mg/dL; very high: 500 mg/dL or more)
- h. Obesity (particularly abdominal obesity)
- i. Sedentary lifestyle (contributes to obesity and reduced HDL)
- j. Type 2 diabetes
- k. Stress; an innate, competitive, aggressive type A personality seems less important than amount of stress and client's psychologic response)
- l. Metabolic syndrome: cluster of signs including hyperlipidemia, low HDL level, abdominal obesity, increased BP, insulin resistance, increased levels of C-reactive protein, and increased fibrinogen level

#### B Clinical findings

##### 1. Subjective:

- a. Retrosternal chest pain that may radiate to arms, jaw, neck, shoulder, or back; pain described as “pressure,” “crushing,” or “viselike”; palpitations, apprehension, feeling of dread/impending doom, dyspnea, nausea, vomiting; pain of angina can be associated with activity and generally subsides with rest; asymptomatic with silent ischemia
- b. Atypical symptoms of angina in women include exertion-related discomfort above waist; burning or tenderness to touch in back, shoulders, arm, jaw, abdomen; overwhelming fatigue; indigestion; feeling of unease

## 2. Objective

- a. ECG changes may reveal ischemia (inverted T wave, elevated ST segment) or evidence of MI (presence of Q wave); a Holter monitor may be used to detect changes associated with activities of daily living (ADLs)
- b. Elevated levels of serum enzymes and isoenzymes with MI
  - (1) Cardiac troponin T (cTnT) levels increase within 3 to 6 hours and remain elevated for 14 to 21 days; accurate for assessing myocardial damage
  - (2) Cardiac troponin I (cTnI) levels rise 7 to 14 hours after an MI and remain elevated for 5 to 7 days; specific for myocardial damage
  - (3) Creatinine kinase (CK) levels elevate 3 to 6 hours after infarction, peaking at 24 hours, and returning to normal within 72 hours
  - (4) MB isoenzyme of creatine kinase (CK-MB) levels elevate 4 to 6 hours after pain, peaking within 24 hours, and returning to normal within 72 hours; specific for myocardial damage
  - (5) Myoglobin levels elevate in 1 to 3 hours; returning to normal within 12 hours
- c. C-reactive protein (CRP): elevation suggests inflammation of the vascular endothelium and coronary artery calcification
- d. Doppler flow studies
- e. Cardiac nuclear scanning (thallium, multigated acquisition scan [MUGA]) or echocardiographic studies help determine extent of vessels involved
- f. Sympathetic nervous system responses: pallor, tachycardia, diaphoresis, vomiting
- g. Signs associated with MI: dysrhythmia, elevated temperature, elevated sedimentation rate, and increased WBCs

## C Therapeutic interventions

### 1. Prevention of MI

- a. Supervised exercise program to avoid ischemia but promote collateral circulation and increase HDL; weight control; smoking cessation; dietary restriction of sodium, cholesterol, and total and saturated fat; management of hypertension, hyperlipidemia, and diabetes
- b. Pharmacologic management: nitrates, beta-blocking agents, calcium channel blocking agents, antilipidemics, antiplatelet agents, ACEIs (see [Related Pharmacology](#))
- c. Supplemental oxygen during anginal attack as needed
- d. Percutaneous coronary interventions (PCIs) such as percutaneous transluminal

coronary angioplasty (PTCA), coronary artery stent placement, and atherectomy to revascularize myocardium

e. Coronary artery bypass graft (CABG) if medical regimen not successful

## 2. Management of acute MI

### a. Improvement of perfusion

- (1) Administration of aspirin immediately
- (2) Beta blockers or angiotensin II receptor blockers for left ventricular systolic dysfunction (LVSD)
- (3) Thrombolytic therapy within 30 minutes of arrival; anticoagulants
- (4) IV nitroglycerin
- (5) ACEIs
- (6) Antidysrhythmics to maintain cardiac function
- (7) PCI within 90 minutes of arrival at emergency department
- (8) Intraaortic balloon pump that inflates during diastole and deflates during systole to decrease cardiac workload by decreasing afterload and increasing myocardial perfusion for cardiogenic shock
- (9) Aspirin, beta blocker, and possible antilipidemic prescribed at discharge

### b. Promotion of comfort and rest

- (1) Analgesics (e.g., IV morphine) to reduce pain, anxiety, and cardiac workload by decreasing preload and afterload
- (2) Oxygen to improve tissue oxygenation
- (3) Maintenance of bed or chair rest to decrease oxygen tissue demands
- (4) Diet therapy: 2 g sodium diet or clear liquids, depending on presence of nausea

### c. Continuous monitoring

- (1) Pulse oximetry
- (2) Cardiac monitoring: rate, evidence of ischemia, and dysrhythmias
- (3) Vital signs
- (4) Hemodynamic monitoring with pulmonary artery catheter (see [Related Procedures](#))

### d. Assessment for complications of MI

- (1) Dysrhythmias
- (2) Cardiogenic shock
- (3) Pulmonary edema caused by acute heart failure
- (4) Thromboembolism
- (5) Extension of MI
- (6) Pericardial effusion and cardiac tamponade

## ***Nursing Care of Clients with Coronary Artery Disease***

### **Assessment/Analysis**

1. History of chest, arm, shoulder, neck, jaw pain
2. Precipitating factors (e.g., exercise, cold)

3. Risk factors (nonmodifiable and modifiable)
4. Vital signs
5. I&O (fluid volume overload is dangerous if cardiac output is compromised)
6. Adventitious breath sounds and dependent edema with impending failure
7. Restlessness, dyspnea
8. Skin: diaphoresis; pallor; cyanosis
9. If MI is suspected, continuous ECG monitoring to detect changes in rate, rhythm, and conduction of impulses; life-threatening dysrhythmias (e.g., ventricular fibrillation and ventricular standstill); dysrhythmias such as premature ventricular complexes close to a T wave, ventricular tachycardia, torsades de pointes (a ventricular tachycardia with a prolonged QT interval that is linked to rapid deterioration), and atrial fibrillation

## Planning/Implementation

1. Teach signs and management of cardiac ischemia (e.g., rest; nitrates; seek emergency care if ineffective)
2. Encourage prophylactic administration of nitrates (see [Related Pharmacology](#))
3. Reinforce need to avoid exertion (e.g., shoveling snow) and exposure to cold; however, emphasize the need for regular exercise approved by health care provider or participation in cardiac rehabilitation program
4. Support involvement in smoking cessation, weight control, and exercise programs
5. Encourage following dietary program
  - a. Low cholesterol, low fat (substitute unsaturated fat for saturated fat), low sodium (2 g daily)
  - b. Replace vegetable oils high in polyunsaturated fatty acids with those high in monounsaturated fatty acids, such as olive oil and canola oil
  - c. Eat fish high in omega-3 fatty acids several times per week (e.g., salmon, tuna, halibut)
  - d. Follow DASH diet; increase intake of high-fiber foods such as fruits, vegetables, cereal grains, and legumes; soluble fiber is particularly effective in reducing blood lipid levels (e.g., oat bran, legumes); low-fat dairy
  - e. Eliminate stimulants such as caffeine (e.g., coffee, tea, chocolate, colas, energy drinks) that can precipitate dysrhythmias
6. Educate about medications (see [Related Pharmacology](#))
7. Provide emotional support regarding alteration in lifestyle
8. Provide care after an acute MI
  - a. Document dysrhythmia and respond per protocol: medication, defibrillation, or CPR
  - b. Reduce cardiac demand: administer oxygen, analgesics, vasodilators, and other medications as prescribed
  - c. Reduce risk for sensory overload: orient to unit and equipment; allow time to express feelings; encourage short visits by significant others
  - d. Use measures to prevent sequelae of diminished activity: thrombophlebitis, pneumonia, constipation, skin breakdown, deconditioning

## Evaluation/Outcomes

1. Remains free of chest pain
2. Verbalizes a reduced level of anxiety
3. Adheres to prescribed regimen (e.g., dietary, pharmacologic, and exercise)
4. Maintains oxygen saturation at 95% on room air

## Inflammatory Disease of the Heart: Pericarditis, Myocarditis, Infective Endocarditis

### **Data Base**

#### A Etiology and pathophysiology

##### 1. Pericarditis

- a. Acute or chronic inflammation of the pericardium
- b. May be idiopathic or result from: bacterial infection (e.g., streptococcal, staphylococcal, gonococcal, meningococcal organisms); viral infection (e.g., coxsackievirus, influenza); mycotic (e.g., fungal) infection; rickettsial and parasitic infestation; trauma; collagen disease; rheumatic fever; neoplastic disease secondary to lung and breast metastasis; 4 to 6 weeks after cardiac surgery or myocardial infarction (Dressler's syndrome—pericarditis caused by antigen-antibody reaction to necrotic myocardium; causes pleural friction rub and fever)
- c. Sequelae: loss of pericardial elasticity or accumulation of fluid within the sac; heart failure or cardiac tamponade

##### 2. Myocarditis

- a. Inflammation of the myocardium
- b. May result from viral, bacterial, mycotic, parasitic, protozoal, or spirochetal infections or infestations; rheumatic fever; endocarditis; impaired immune system
- c. Sequelae: impaired contractility of the heart caused by the inflammatory process; myocardial ischemia and necrosis; heart failure

##### 3. Infective endocarditis

- a. Inflammation of inner lining of heart and valves
- b. May result from bacterial, fungal, or rickettsial infections; rheumatic heart disease; presence of invasive lines or prosthetic valves; IV drug use
- c. Sequelae: structural damage to valves; pump failure; embolization

#### B Clinical findings

1. Subjective: precordial or substernal pain; dyspnea; chills; fatigue and malaise
2. Objective: dysrhythmias; increased cardiac enzymes; fever; positive blood cultures; friction rubs evident on auscultation; petechiae on body and splinter hemorrhages under nails with infective endocarditis

#### C Therapeutic interventions

1. Oxygen therapy and bed rest
2. Antibiotics to relieve underlying infection; corticosteroids; nonsteroidal antiinflammatory agents to suppress rheumatic activity
3. Pericardectomy (surgical removal of scar tissue and pericardium), if indicated

4. Cardiac monitoring

## ***Nursing Care of Clients with Inflammatory Disease of the Heart***

### **Assessment/Analysis**

1. Signs of shock, heart failure, and dysrhythmias
2. Temperature to obtain baseline
3. Distention of neck veins
4. Friction rub and murmur
5. Overt and covert indicators of pain

### **Planning/Implementation**

1. Maintain a tranquil environment to promote maximum rest; medicate for discomfort as needed
2. Administer IV antibiotics as prescribed
3. Monitor temperature and blood cultures to evaluate antibiotic therapy
4. Provide care after cardiac surgery (see [Cardiac Surgery](#))
5. Explain posthospitalization therapy (e.g., lifelong doses of antibiotics prophylactically when undergoing invasive procedures)

### **Evaluation/Outcomes**

1. Verbalizes pain is relieved
2. Achieves afebrile state
3. Maintains vital signs within expected limits
4. Adheres to therapeutic regimen

## **Heart Failure (HF)**

### ***Data Base***

A Etiology and pathophysiology

1. Inability of heart to meet oxygen demands of the body
2. Pump failure may be caused by cardiac abnormalities or conditions that place increased demands on the heart such as cardiac muscle disorders, valvular defects (e.g., mitral valve prolapse with regurgitation, aortic stenosis), hypertension, coronary atherosclerosis, hyperthyroidism, obesity, chronic obstructive pulmonary disease (COPD), and circulatory overload
3. Heart failure may be classified as diastolic (impaired ventricular filling) or systolic (impaired ventricular contraction); determined by ejection fraction
4. When one side of heart “fails,” there is buildup of pressure in the vascular system feeding into that side; signs of right ventricular failure are first evident in the systemic circulation; those of left ventricular failure are first evident in the pulmonary system, causing pulmonary edema; eventually affects both pulmonary and systemic circulation

5. Decreased cardiac output activates the renin-angiotensin-aldosterone mechanism and sympathetic nervous system, leading to vasoconstriction and retention of sodium and water thus increasing cardiac workload

## B Clinical findings

1. Left ventricular heart failure
  - a. Subjective: dyspnea from fluid within lungs; orthopnea; fatigue; restlessness; paroxysmal nocturnal dyspnea
  - b. Objective: decreased oxygen saturation; crackles; peripheral cyanosis; Cheyne-Stokes respirations; frothy, blood-tinged sputum; dry, nonproductive cough; decreased ejection fraction; dyspnea; decreased urine output; S3/S4 summation gallop
2. Right ventricular failure
  - a. Subjective: abdominal pain; fatigue; bloating; nausea
  - b. Objective: jugular vein distention (JVD); dependent, pitting edema that often subsides at night when legs are elevated; ankle edema is frequently the first sign of HF; ascites from increased hydrostatic pressure within portal system; hepatomegaly; anorexia; respiratory distress (e.g., use of accessory muscles of respiration); increased central venous pressure (CVP); diminished urinary output
3. Diagnostic tests
  - a. B-type natriuretic peptide (BNP) rises (normal value is  $<100$  pg/mL); produced by myocardium in response to increased ventricular end-diastolic pressure; functions to promote diuresis and vasodilation, which reduces cardiac workload
  - b. Echocardiogram to assess ventricular function/hypertrophy
  - c. Hemodynamic monitoring for cardiogenic shock
  - d. Electrolytes, hematocrit, hemoglobin, BUN, creatinine, complete blood count, thyroid-stimulating hormone, and ECGs are done to identify underlying causes

## C Therapeutic interventions

1. Rest in high-Fowler or orthopneic position to reduce cardiac workload
2. Morphine to reduce anxiety and dyspnea
3. Oxygen therapy; endotracheal intubation and a ventilator for acute ventricular failure
4. Decrease cardiac workload with diuretics, vasodilators, ACEIs, ARBs, beta blockers, phosphodiesterase inhibitors, and nesiritide (Natrekor)
5. Increase pump performance with digitalis or dobutamine (Dobutrex)
6. Potassium supplements to prevent digitalis toxicity and hypokalemia
7. Hemodynamic monitoring through a multilumen pulmonary artery catheter
8. Sodium-restricted diet to limit fluid retention and promote fluid excretion
9. Paracentesis if ascites exists and is causing respiratory distress
10. Cardiac resynchronization therapy: use of right and left ventricular pacemaker leads to synchronize contractions and improve cardiac output

## ***Nursing Care of Clients with Heart Failure***

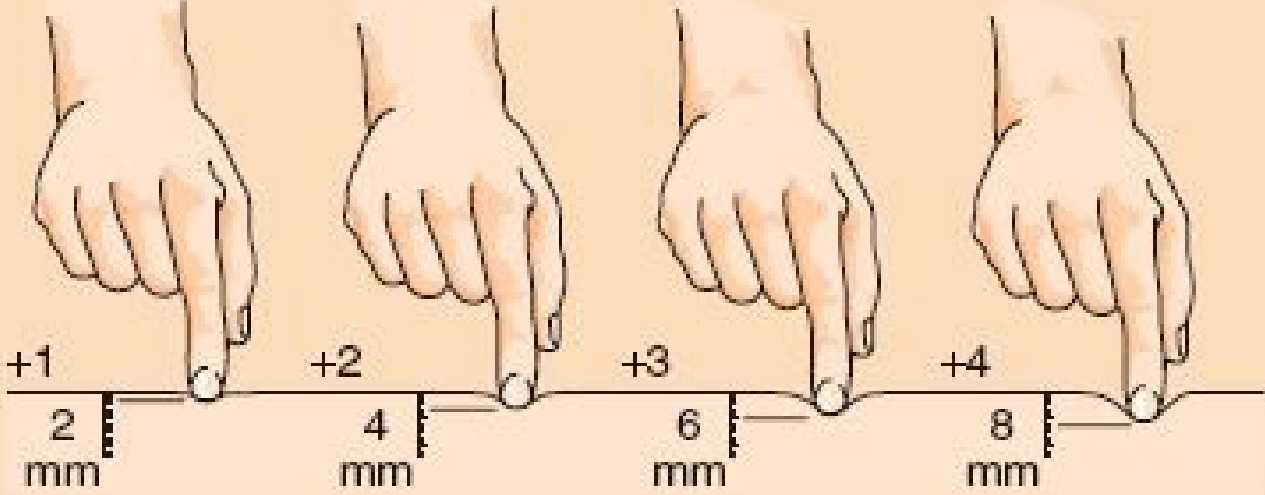

### **Assessment/Analysis**

1. Baseline vital signs, breath sounds, oxygen saturation ( $\text{SaO}_2$ )
2. Daily weight, extent of pitting edema, circumference of edematous extremities, abdominal girth, jugular vein distention (JVD) ([Table 6-2: Pitting Edema Scale](#))

**Table 6-2**  
**Pitting Edema Scale**

Scale	Description	Measurement
1+	Barely perceptible pit	2 mm (3/32 in.)
2+	Deeper pit; rebounds in a few seconds	4 mm (5/32 in.)
3+	Deep pit; rebounds in 10-20 seconds	6 mm (1/4 in.)
4+	Deeper pit; rebounds in >30 seconds	8 mm (5/16 in.)

The illustration shows four hands, each pressing down on a horizontal line to create a pit. Below each pit is a vertical scale bar with a horizontal line indicating the depth of the pit. The pits are labeled +1, +2, +3, and +4 from left to right. The corresponding measurements are 2 mm, 4 mm, 6 mm, and 8 mm respectively.

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.

3. Hemodynamic status (e.g., CVP, PCWP)
4. Electrolyte levels (e.g., sodium, chloride, potassium)
5. I&O

## Planning/Implementation

1. Maintain in high-Fowler or orthopneic position; administer supplemental oxygen
2. Elevate extremities except when in acute distress
3. Monitor vital signs, breath sounds, JVD,  $\text{SaO}_2$
4. Change position slowly and frequently
5. Monitor I&O, daily weight, electrolytes
6. Restrict fluids as ordered
7. Provide small, frequent, low-sodium meals
8. Monitor invasive lines
9. Administer medications as prescribed: cardiac glycosides, antihypertensives, diuretics,

and phosphodiesterase inhibitors (see [Related Pharmacology](#))

10. Help to establish balanced schedule of rest and activity; lifestyle modifications (e.g., weight control, smoking cessation)

11. Teach importance of continued health care provider supervision

## Evaluation/Outcomes

1. Maintains adequate tissue perfusion
2. Reduces peripheral edema/ascites
3. Adheres to pharmacologic and dietary regimen

## Cardiac Surgery

### **Data Base**

#### A Purposes

1. Correct abnormalities: mitral stenosis or regurgitation; aortic stenosis or insufficiency; coronary occlusion; ventricular aneurysm
2. Replace failing heart (cardiac transplantation): terminal heart disease with life expectancy of less than 1 year; viral myocarditis; toxic injury to the myocardium; severe coronary heart disease

B Types of procedures: open (may require cardiopulmonary bypass machine [CPB]) or closed

1. Hypothermia may be used to decrease metabolic rate during cardiac surgery
2. Coronary artery bypass graft (CABG) surgery is done when severe atherosclerotic disease causes ischemia; involves anastomosis of a graft or a segment of a vessel (e.g., internal mammary artery, saphenous vein), bypassing diseased portion of a coronary artery; one or more vessels may be bypassed
3. Cardiac transplantation involves replacement of the diseased heart with one from a compatible donor; requires lifelong antirejection drugs including steroids and immunosuppressants
4. Surgical removal (ablation) of foci and pathways of dysrhythmias; involves mapping cardiac electrophysiologic function to locate sources of dysrhythmic foci; surgical resection is made through a sternotomy
5. Surgical repair or replacement of valves with biological or mechanical prosthetics

### **Nursing Care of Clients after Cardiac Surgery**

## Assessment/Analysis

1. Hemodynamic monitoring, vital signs
2. Airway patency, breath sounds, SaO<sub>2</sub>
3. Tubes (e.g., indwelling urinary, chest, nasogastric) to ensure patency and to assess drainage
4. Incision for signs of hemorrhage or infection

5. Clinical indicators of complications: MI, HF, cardiac tamponade, cerebral ischemia, bleeding, fluid volume excess or deficit, dysrhythmias, renal failure

## Planning/Implementation

1. Monitor hemodynamic functioning
2. Evaluate neurologic signs
3. Rewarm slowly to prevent shivering and monitor temperature for increases because fever and shivering increase workload of the heart
4. Maintain airway; an endotracheal tube with mechanical ventilation will be in place postoperatively; suction secretions as necessary; encourage coughing, deep breathing, and incentive spirometry when artificial airway is removed
5. Monitor I&O; weigh regularly
6. Assess pain (e.g., nature, site, duration, type) and provide relief
7. Monitor arterial blood gases
8. Maintain patency of indwelling urinary catheter; monitor characteristics of urine including specific gravity
9. Provide care related to chest tubes; report if drainage exceeds 200 mL/hr (see Related Procedures, Chest Tubes in [Chapter 7](#))
10. Administer parenteral therapy, including electrolytes and blood
11. Stay with client and explain procedures to limit anxiety and fear; encourage expression of feelings; provide emotional support
12. Assess involved leg if saphenous vein has been used: assess for signs of impaired circulation, edema, or infection (some edema expected when leg is dependent)
13. Monitor for signs of complications
  - a. Hemorrhage that can lead to hypovolemia: decreased BP; increased pulse rate; restlessness; apprehension; lowered CVP; pallor
  - b. Cardiac tamponade caused by collection of fluid or blood within pericardium: decreased arterial pressure; elevated CVP; rapid, thready pulse; diminished output
  - c. HF: dyspnea; elevated CVP; tachycardia; edema
  - d. MI
  - e. Acute renal failure
  - f. Thromboembolic event affecting pulmonary, cerebral, or peripheral circulation
  - g. Infection
  - h. Psychosis resulting from inability to cope with anxiety associated with cardiac surgery or being in an intensive care environment

## Evaluation/Outcomes

1. Achieves adequate cardiac output
2. Verbalizes lower pain levels
3. Performs self-care activities

## Vascular Disease: Thrombophlebitis, Varicose Veins, and

# Peripheral Vascular Disease

## Data Base

### A Etiology and pathophysiology

1. Thrombus: a clot composed of platelets, fibrin, clotting factors, and cellular debris attached to interior wall of an artery or vein
2. Embolus: a clot or solid particle carried by bloodstream; may interfere with tissue perfusion in an artery or vein
3. Arterial disorders involve depriving oxygen to a body part or tissue; affected by BP and collateral circulation
  - a. Reduced blood flow resulting from atherosclerosis, thrombus, or embolus
  - b. Lower extremity arterial disease (LEAD); atherosclerosis leads to blockage of blood supply to lower legs and feet
  - c. Buerger's disease (thromboangiitis obliterans)
    - (1) Peripheral circulation impaired by inflammatory occlusions of peripheral arteries; thromboses of arteries may occur
    - (2) Incidence is highest in young adult males who smoke
  - d. Raynaud's disease
    - (1) Spasms of digital arteries thought to be caused by abnormal response of sympathetic nervous system to cold or emotional stress; usually bilateral; primarily occurs in young females and continues throughout life
    - (2) Raynaud's phenomenon is episodic arterial spasm of the extremities secondary to another disease or abnormality
4. Venous disorders: interfere with transportation of blood back to the heart from the capillary beds; pathophysiologic changes may include impaired smooth muscle around vessels, lack of muscular contraction, damage to intima, incompetent valves; risk factors include immobility, venous stasis, vessel trauma, oral contraceptive use, pregnancy, obesity, and pelvic surgery
  - a. Thrombophlebitis: inflammation of a vein
  - b. Deep vein thrombosis (DVT): thrombophlebitis associated with clot formation
  - c. Venous thromboembolism (VTE): DVT associated with pulmonary embolism
  - d. Varicose veins: occur when veins in lower extremities become dilated and congested, which increases hydrostatic pressure, and tortuous as a result of weakness of valves or loss of elasticity of vessel walls; risk factors include family history, prolonged standing, pregnancy, leg trauma, thrombophlebitis

### B Clinical findings

1. Peripheral arterial disorders
  - a. Subjective: paresthesia; aching to severe or burning pain; lower extremity pain with exercise (intermittent claudication)
  - b. Objective: pallor or dependent rubor; shiny, cool skin; hair loss; thickened nails; gangrenous ulcers of toes or heel; diminished or absent pulses; and decreased ankle-brachial index
2. Thrombophlebitis or DVT

- a. Subjective: may be asymptomatic until embolus is released and occludes organ; calf pain on dorsiflexion of ankle (Homans sign) is not a reliable indicator; this sign should not be elicited because dorsiflexion may dislodge the thrombus
- b. Objective: edema of one leg; redness and warmth of area along the vein; Doppler studies/flow studies of lower extremities indicate obstruction or decreased flow from the area, suggesting thrombus formation; positive D-dimer assay, which indicates products of fibrin degradation in the blood (normal value is <250 mcg/L)

### 3. Varicose veins

- a. Subjective: heaviness and fatigue in legs with cramping; usually relieved when legs are elevated
- b. Objective: positive venogram; positive Trendelenburg test is diagnostic of varicose veins; brown skin discoloration from breakdown of hemoglobin and deposition of ferrous sulfate; edema; stasis ulcers usually develop around ankles and calf from venous insufficiency

## C Therapeutic intervention

### 1. Peripheral vascular disease

- a. Arterial vasodilators and antiplatelet agents
- b. Sympathectomy to sever sympathetic ganglia supplying the area; there is local vasodilation with improved circulation
- c. Bypass grafting
- d. Amputation if vascular supply is severely impaired (see Amputation in Nursing Care of Clients with Neuromusculoskeletal System Disorders in [Chapter 11](#))

### 2. Varicose veins

- a. Sclerotherapy: injection of a chemical irritant into vein
- b. Surgical intervention: ligation of vein above the varicosity and removal of the involved vein; the great saphenous vein may be ligated near the femoral junction (deep veins must be able to accommodate venous flow); early ambulation to prevent formation of thrombi

### 3. Thrombophlebitis

- a. Prophylactic interventions: antiembolism stockings and exercises to promote venous return
- b. Moist heat to promote vasodilation
- c. Elevation of extremity to reduce edema
- d. Anticoagulants to prevent recurrence
- e. Vasodilators to prevent vascular spasm
- f. Thrombolytic therapy to dissolve clot
- g. Transvenous filter or thrombectomy

## ***Nursing Care of Clients with Vascular Disease***

### **Assessment/Analysis**

- 1. Risk factors and subjective data
- 2. Affected extremity for pulses, color, temperature, and circumference; a Doppler scan

facilitates attainment of peripheral pulses

### 3. Mobility of involved extremity

## Planning/Implementation

1. Observe for signs of vascular impairment (e.g., pallor, cyanosis, coolness of involved extremities, and amplitude and symmetry of peripheral pulses)
2. Instruct to avoid cigarette smoking (nicotine constricts vessels, massaging legs), maintaining one position for long periods, and wearing tight clothing that can affect peripheral vessels; reduce weight when indicated; control diabetes, hypertension, and lipid levels; maintain adequate hydration; perform ankle exercises so muscle contractions prevent venous stasis
3. Venous insufficiency: elevate legs to limit edema; apply antiembolism stockings before arising; apply sequential compression device for clients on prescribed bed rest; if thrombophlebitis is suspected, maintain bed rest and notify health care provider
4. Arterial insufficiency: keep extremities warm; instruct to wear gloves when exposed to cold and apply lubricants to keep skin supple; maintain dependent position of extremities to increase arterial flow and limit pain
5. Observe for clinical manifestations of thrombophlebitis and pulmonary embolism (e.g., sudden chest pain, cyanosis, hemoptysis, shock); maintain client on bed rest and notify health care provider if thrombophlebitis or pulmonary embolism is suspected
6. Provide specific care if undergoing vascular surgery: monitor for hemorrhage; notify health care provider if bleeding is suspected; assess neurovascular status of extremity; keep extremity elevated in immediate postoperative period; allow out of bed as ordered (see Amputation, Nursing Care in [Chapter 11](#))
7. Provide specific care after vein ligation: elevate foot of the bed for first 24 hours; observe for signs of hemorrhage; maintain compression dressings; assist with ambulation
8. Provide specific care after endarterectomy and bypass grafting
  - a. Assess circulation of involved area by checking pulses, capillary refill, color, temperature, mobility, and sensory function
  - b. Monitor BP because hypotension increases possibility of thrombus formation; encourage hydration to maintain blood volume and decrease viscosity
  - c. Observe for signs of hemorrhage and pain; changes in skin color; alteration of vital signs
  - d. Ambulate as ordered; sitting should be avoided
9. Administer prescribed medications

## Evaluation/Outcomes

1. Maintains tissue perfusion
2. Verbalizes reduction in pain

## Aneurysms

# **Data Base**

## **A Etiology and pathophysiology**

1. Distention at site of a weakness in an arterial wall
  - a. Saccular aneurysm: pouchlike projection on one side of artery
  - b. Fusiform aneurysm: entire circumference of arterial wall is dilated
  - c. Mycotic aneurysm: tiny weaknesses in arterial walls resulting from infection
  - d. Dissecting aneurysm: tear in the inner lining of an arteriosclerotic aortic wall causes blood to form a hematoma between layers of the artery, compressing the lumen
2. Causes: congenital weakness; syphilis; trauma; atherosclerosis (most common cause of both thoracic and abdominal aortic aneurysms)
3. Represent surgical emergency if ruptured
4. Thoracic aortic aneurysms occur most frequently in middle-aged males; abdominal aneurysms between 60 and 90 years
5. Risk factors include history of hypertension, obesity, stress, hypercholesterolemia, cigarette smoking, familial tendency

## **B Clinical findings**

1. Thoracic aortic aneurysm
  - a. Subjective: may be asymptomatic; dyspnea; dysphagia; pain resulting from pressure against nerves or vertebrae
  - b. Objective: hoarseness, cough, and aphonia from impingement on laryngeal nerve; unequal pulses and arterial pressure in upper extremities; trachea may be displaced from midline because of adhesions between trachea and aneurysm
2. Abdominal aortic aneurysm
  - a. Subjective: may be asymptomatic; lower back or abdominal pain, which may be severe if aneurysm is leaking; sensory changes in lower extremities if aneurysm ruptures
  - b. Objective: hypertension; pulsating abdominal mass; mottling of lower extremities and increased abdominal girth if aneurysm ruptures
3. Dissecting aortic aneurysm
  - a. Subjective: restlessness; anxiety; severe pain
  - b. Objective: diminished pulses; signs of shock

## **C Therapeutic interventions**

1. Resection/repair of aneurysm with a vascular graft or endovascular stent
2. Aimed at controlling cardiac output and BP by pharmacological therapy because elevated BP increases risk of graft rupture

# **Nursing Care of Clients with Aneurysms**

## **Assessment/Analysis**

1. History of risk factors
2. Pulsation in abdomen (palpate gently)

3. Severe back or abdominal pain (may indicate impending rupture)
4. Peripheral neurovascular status

## Planning/Implementation

1. Monitor neurovascular status of extremities
2. Monitor hemodynamic status, vital signs, SaO<sub>2</sub>, ECG
3. Record I&O, because acute renal failure may occur after surgery
4. Administer prescribed opioids to alleviate pain
5. Apply abdominal binder to provide support when client is coughing, deep breathing, and ambulating
6. Prevent flexion of hip and knees to eliminate pressure on arterial wall

## Evaluation/Outcomes

1. Maintains adequate peripheral circulation
2. Makes lifestyle changes to modify risk factors

## Shock

### Data Base

#### A Etiology and pathophysiology

1. Hypovolemic: occurs when there is loss of fluid resulting in inadequate tissue perfusion; caused by excessive bleeding, diarrhea, or vomiting; fluid loss from fistulas or burns
2. Cardiogenic: occurs when pump failure causes inadequate tissue perfusion; caused by HF, MI, cardiac tamponade
3. Neurogenic: caused by rapid vasodilation and subsequent pooling of blood within peripheral vessels; caused by spinal anesthesia, emotional stress, drugs that inhibit the sympathetic nervous system, spinal injury
4. Anaphylactic: caused by an allergic reaction that results in a massive release of histamine and subsequent vasodilation
5. Septic (similar to anaphylactic): reaction to bacterial toxins (generally gram-negative infections) that causes leakage of plasma into tissues, resulting in hypovolemia

#### B Clinical findings

1. Subjective: apprehension; restlessness; paresis of extremities
2. Objective: weak, rapid, thready pulse; diaphoresis; cold, clammy skin; pallor; decreased urine output; progressive loss of consciousness; decreased mean arterial pressure (normal is 80 to 120 mm Hg)

#### C Therapeutic interventions

1. Correction of underlying cause
2. Fluid and blood replacement
3. Oxygen therapy, ventilator
4. Elevation of lower extremities to ensure circulation to vital organs

5. Cardiac and hemodynamic monitoring
6. Vasoconstricting drugs to increase BP: norepinephrine (Levophed), DOPamine (Intropin), vasopressin (Pitressin)
7. Cardiotonics or inotropic agents to increase cardiac contractility: DOBUTamine (Dobutrex), DOPamine (Intropin), epiNEPHrine (Adrenalin), milrinone (Primacor)
8. Vasodilating drugs to reduce myocardial workload and ischemia: nitroglycerin (Tridil); nitroprusside (Nitropress)
9. Antihistamines: diphenhydrAMINE (Benadryl) and steroids for anaphylactic shock
10. Antibiotics for septic shock based on blood cultures
11. Drotrecogin alfa (Xigris) to interfere with coagulation cascade and decrease mortality from septic shock
12. Intraaortic balloon pump may be used to augment the failing heart

## ***Nursing Care of Clients in Shock***

### **Assessment/Analysis**

1. History of causative and risk factors
2. Fluid I&O over previous 24 hours
3. Signs of covert bleeding: rapid, thready pulse; hypotension; increased respirations; cold, clammy skin
4. Mental status changes: restlessness and confusion progressing to lethargy and decreased level of consciousness
5. Cardiovascular status: ECG, hemodynamic monitoring, peripheral vascular assessment
6. Respiratory status: breath sounds, arterial blood gases, SaO<sub>2</sub>

### **Planning/Implementation**

1. Keep warm; place in supine position
2. Monitor hemodynamic status and vital signs
3. Monitor urine output and specific gravity
4. Allay anxiety
5. Administer intravenous fluids and titrate parenteral vasoactive medications as prescribed
6. Monitor oxygen saturation and provide oxygen therapy as indicated

### **Evaluation/Outcomes**

1. Maintains stable hemodynamic status
2. Maintains urine output >30 mL/hour
3. Remains oriented to time, place, and person
4. Maintains adequate cardiac output

## **Anemias and Blood Disorders**

# Data Base

## A Etiology and pathophysiology

1. Anemia: reduction in concentration of erythrocytes (RBCs) or hemoglobin
  - a. Iron deficiency anemia: most common causes are GI bleeding, menstruation, malignancy; other causes include inadequate dietary intake, malabsorption, and increased demand (e.g., pregnancy)
  - b. Megaloblastic anemia
    - (1) Folate deficiency: insufficient amount of folic acid absorbed or ingested to synthesize DNA, RNA, and proteins; associated with alcoholism, malabsorption, pregnancy, lactation
    - (2) Pernicious anemia: lack of intrinsic factor in the stomach prevents absorption of vitamin B<sub>12</sub>, reducing the formation of adequate numbers of erythrocytes
  - c. Aplastic (hypoplastic) anemia: bone marrow is depressed or destroyed by a chemical or drug, leading to leukopenia, thrombocytopenia, decreased erythrocytes, and decreased leukocytes (agranulocytosis)
  - d. Hemolytic anemia: excessive or premature destruction of RBCs; causes include sickle cell anemia, thalassemia, glucose-6-phosphate dehydrogenase (G-6-PD) deficiency, antibody reactions, infection, and toxins
2. Polycythemia vera: sustained increase in number of erythrocytes, leukocytes, and platelets, with an increased blood viscosity
3. Thrombocytopenic purpura: appears to result from production of an antiplatelet antibody that coats surface of platelets and facilitates their destruction by phagocytic leukocytes

## B Clinical findings

1. Subjective: fatigue, headache, paresthesias, dyspnea; sore mouth with pernicious anemia; bleeding gums and epistaxis with thrombocytopenic purpura
2. Objective
  - a. Ankle edema
  - b. Dry, pale mucous membranes
  - c. Pallor except with polycythemia vera and hemolytic anemia
  - d. Iron deficiency anemia: decreased levels of hemoglobin, erythrocytes, ferritin; increased iron-binding capacity; megaloblastic condition of blood
  - e. Pernicious anemia: beefy red tongue, lack of intrinsic factor, positive Romberg's test (loss of balance with eyes closed)
  - f. Aplastic anemia: fever; bleeding from mucous membranes; decreased levels of leukocytes, erythrocytes, and platelets
  - g. Hemolytic anemia: increased reticulocytes and unconjugated bilirubin levels; jaundice
  - h. Polycythemia vera: increased hemoglobin level, purple-red complexion
  - i. Thrombocytopenic purpura: low platelet count, ecchymotic areas, hemorrhagic petechiae

## C Therapeutic interventions

1. Improvement of diet: include ascorbic acid, which enhances iron uptake
2. Supplements: iron, vitamin B<sub>12</sub>, folic acid
3. Blood transfusions (except for polycythemia vera)
4. Oxygen as needed
5. Epoetin (Epogen, Procrit) to stimulate bone marrow function
6. Aplastic anemia: bone marrow transplant (BMT); peripheral blood stem cell transplant (PBSCT); immunosuppressive therapy
7. Hemolytic anemia: splenectomy if indicated
8. Polycythemia vera: routine phlebotomy; low-iron diet; hydroxyurea (Droxia, Hydrea) to suppress bone marrow

## ***Nursing Care of Clients with Anemias and Blood Disorders***

### **Assessment/Analysis**

1. History of dietary habits, symptoms, and causative agents
2. Status of skin, mucous membranes, and sclera
3. Baseline vital signs

### **Planning/Implementation**

1. Teach dietary modifications and medication administration; emphasize foods high in iron (e.g., spinach, raisins, liver)
2. Help to balance rest and activity
3. Explain need for prevention of hemorrhage related to thrombocytopenia
4. Provide postoperative care if splenectomy is performed; encourage deep breathing and coughing; assess for abdominal distention that may reflect hemorrhage
5. Polycythemia vera: explain need for repeated phlebotomies and interventions to prevent DVTs

### **Evaluation/Outcomes**

1. States/selects dietary sources of iron, folic acid, and vitamin B<sub>12</sub>
2. Verbalizes need for and continues long-term therapeutic supervision
3. Performs activities of daily living
4. Remains afebrile and injury-free

## **Disseminated Intravascular Coagulation (DIC)**

### ***Data Base***

#### A Etiology and pathophysiology

1. Response to overstimulation of clotting and anticlotting processes as a result of injury or disease; massive amounts of microthrombi affect microcirculation
2. Complicated by hemorrhage at various sites as a result of fibrinolytic response

3. Multiple system failure may occur (e.g., circulatory, respiratory, GI, renal, neurologic) from bleeding or thrombosis

#### B Clinical findings

1. Subjective: restlessness, anxiety
2. Objective
  - a. Low fibrinogen level; prolonged prothrombin and partial thromboplastin times; reduced platelets; positive D-dimer assay
  - b. Hemorrhage, both subcutaneous and internal; petechiae; signs of organ failure

#### C Therapeutic interventions

1. Relieve underlying cause
2. Heparin to prevent formation of thrombi
3. Transfusion of blood products
4. Antifibrinolytic therapy to prevent bleeding if necessary

## ***Nursing Care of Clients with Disseminated Intravascular Coagulation***

### **Assessment/Analysis**

1. History of causative factors (e.g., septicemia, obstetric emergencies, and septic shock)
2. Bleeding; abnormal coagulation profile

### **Planning/Implementation**

1. Observe for bleeding; replace fluids as ordered
2. Minimize skin punctures; prevent injury
3. Monitor for renal, cerebral, and respiratory complications
4. Provide emotional support

### **Evaluation/Outcomes**

1. Maintains circulation to all tissues
2. Verbalizes a decrease in anxiety
3. Maintains adequate cardiac output

## **Leukemia**

Also see Leukemia in Nursing Care of Preschoolers in [Chapter 32](#).

### ***Data Base***

#### A Etiology and pathophysiology

1. Uncontrolled proliferation of WBCs; classified according to type of WBC affected
  - a. Acute lymphocytic leukemia (ALL): primarily occurs in children
  - b. Acute myeloid leukemia (AML): leukocytes are immature and abnormal; occurs throughout life cycle; incidence increases with age; prognosis is poor with or without chemotherapy

- c. Chronic myeloid leukemia (CML): results from abnormal production of granulocytic cells; occurs after the second decade; majority have Philadelphia chromosome
- d. Chronic lymphocytic leukemia (CLL): results from increased production of leukocytes and lymphocytes and proliferation of cells within bone marrow, spleen, and liver; occurs most commonly in persons 50 to 70 years old; life expectancy is 2.5 to 14 years

- 2. Incidence highest in children aged 2 to 6 years; declines until age 35, then increases steadily
- 3. Etiology unknown, although genetic factors and exposure to certain toxic substances such as radiation seem to increase incidence

#### B Clinical findings

- 1. Subjective: malaise, bone pain
- 2. Objective: anemia, thrombocytopenia, elevated leukocytes, decreased platelets, petechiae, ecchymoses, gingival bleeding, fever, infection

#### C Therapeutic interventions

- 1. Chemotherapy
- 2. Transfusions of whole blood or blood fractions
- 3. Analgesics
- 4. Bone marrow transplant; peripheral blood stem cell transplant
- 5. Radiation to areas of lymphocytic infiltration
- 6. Granulocytic growth factors for neutropenia

## ***Nursing Care of Clients with Leukemia***

### **Assessment/Analysis**

- 1. History of exposure to toxins
- 2. Overt and covert bleeding
- 3. Baseline vital signs; signs and symptoms of anemia, thrombocytopenia, and neutropenia

### **Planning/Implementation**

- 1. Discuss importance of follow-up care with client and family
- 2. Provide emotional support
- 3. Provide specific nursing care related to chemotherapeutic therapy, transfusion, or diagnostic tests
- 4. Maintain a safe, injury-free environment because of increased risk of bleeding
- 5. Use appropriate infection control techniques; initiate neutropenic precautions as needed (e.g., private room; no flowers, fresh fruit or vegetables)
- 6. Pace care to limit fatigue and assist as necessary
- 7. Offer nutrient-dense food and adequate fluid intake

## Evaluation/Outcomes

1. Remains free from bleeding episodes
2. Verbalizes a decrease in anxiety
3. Plans strategies to avoid fatigue
4. Remains free from infection

## Lymphoma

### Data Base

#### A Etiology and pathophysiology

1. Types
  - a. Hodgkin's disease: proliferation of malignant cells (Sternberg-Reed cells) within lymph node(s) usually on one side of the neck; relatively rare with good cure rate; peak incidence in young adult males, second peak when older than 50 years of age
  - b. Non-Hodgkin's lymphoma: 95% involve B lymphocytes, which become infiltrated with malignant cells that spread unpredictably; increased incidence with aging; average age at diagnosis is during sixth decade; becoming increasingly prevalent (sixth most common cancer)
2. All tissues may eventually be involved, but chiefly lymph nodes, spleen, liver, tonsils, and bone marrow
3. Cause is unknown; impaired immune function linked to increased incidence
4. Classification by staging and presence or absence of systemic symptoms

#### B Clinical findings

1. Subjective: pruritus; anorexia; dyspnea and dysphagia caused by pressure from enlarged nodes
2. Objective
  - a. Enlarged lymph nodes; cervical nodes usually are involved first
  - b. Confirmed by histologic examination of a lymph node
  - c. Progressive anemia
  - d. Elevated temperature
  - e. Spleen and liver may enlarge
  - f. Pressure from enlarged lymph nodes may cause dyspnea, edema, and obstructive jaundice
  - g. Thrombocytopenia if spleen and bone marrow involved

#### C Therapeutic interventions

1. Radiotherapy
  - a. Vital organs must be shielded
  - b. Potential side effects: nausea; skin rashes; dry mouth; dysphagia; infections; pancytopenia
2. Chemotherapy: see Neoplastic Disorders, Related Pharmacology, in [Chapter 3](#)
3. Bone marrow transplant; peripheral blood stem cell transplant
4. Surgical intervention includes excision of masses to relieve pressure on other organs

# ***Nursing Care of Clients with Lymphomas***

## **Assessment/Analysis**

1. Lymph nodes to determine enlargement
2. Temperature for baseline
3. Liver and spleen to determine enlargement
4. Complete blood count (CBC) and liver profile for baseline data

## **Planning/Implementation**

1. Provide emotional support
2. Protect from infection
3. Monitor temperature
4. Observe for signs of anemia; provide adequate rest
5. Examine sclera and skin for signs of jaundice
6. Encourage high-nutrient dense foods; monitor for anorexia and nausea; prevent dehydration

## **Evaluation/Outcomes**

1. Remains afebrile
2. Conserves energy
3. Verbalizes feelings related to therapy/prognosis

# CHAPTER 7

# Nursing Care of Clients with Respiratory System Disorders

---

# Overview

## Review of Anatomy and Physiology

### *Structures and Functions of the Respiratory System*

(Figure 7-1: The respiratory system)

**FIGURE 7-1** The respiratory system. The inset shows the alveolar sacs where the interchange of oxygen and carbon dioxide takes place through the walls of the grapelike alveoli. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

- A Upper portion of respiratory system filters, moistens, and warms air during inspiration
1. Nose: lining consists of ciliated mucosa; divided by septum; turbinates (conchae) projected from lateral walls; contains olfactory receptors for smell; aids in phonation
  2. Paranasal sinuses drain into nose: frontal, maxillary, sphenoidal, ethmoidal; aid in phonation
  3. Pharynx: nasopharynx, oropharynx, and laryngopharynx; composed of muscle with mucous lining; contains tonsils, adenoids, and other lymphoid tissue that help destroy

incoming bacteria

4. Larynx: formed by cartilage including thyroid cartilage (Adam's apple), epiglottis (lid cartilage), cricoid (signet ring cartilage), and vocal cords (fibroelastic bands stretched across hollow interior of larynx); paired vocal cords (folds) and posterior arytenoid cartilages form the glottis; voice production—during expiration, air passing through larynx causes vocal cords to vibrate; short, tense cords produce a high pitch; long, relaxed cords, a low pitch
  5. Trachea: smooth muscle walls contain C-shaped rings of cartilage that keep it open at all times; lined with ciliated mucosa; extends from larynx to bronchi; 10 to 12 cm long; furnishes open passageway for air going to and from lungs
- B Lower portion of respiratory system consists of lungs, which enable exchange of gases between blood and air to regulate arterial  $PO_2$ ,  $PCO_2$ , and pH; left lung has two lobes and right lung has three lobes
1. Bronchi: right and left, formed by branching of trachea; right bronchus slightly larger and more vertical than left; each primary bronchus branches into segmental bronchi in each lung; primary and segmental bronchi contain C-shaped cartilage
  2. Bronchioles: small branches off secondary bronchi, distinguished by lack of C-shaped cartilage and a duct diameter of about 1 mm; bronchi further branch into terminal bronchioles, respiratory bronchioles, and then alveolar ducts
  3. Alveoli: microscopic sacs composed of a single layer of squamous epithelial cells (type I cell) enveloped by a network of pulmonary capillaries that allow for rapid gas exchange; type II cells produce surfactant to prevent alveolar collapse, and type III cells are macrophages that protect against bacteria by phagocytosis
  4. Covering of lung: visceral layer of pleura that joins with parietal pleura lining the thorax and diaphragm; space between these two linings is the pleural space and contains a small amount of fluid to eliminate friction; negative pressure in pleural space relative to atmospheric pressure is essential for breathing

## ***Physiology of Respiration***

### A Mechanism of breathing

1. Following phrenic nerve stimulation, diaphragm and other respiratory muscles contract
2. Thorax increases in size
3. Intrathoracic and intrapulmonic pressures decrease
4. Air rushes from positive pressure in atmosphere to negative pressure in alveoli
5. Inspiration is completed with stimulation of stretch receptors
6. Expiration occurs passively as a result of recoil of elastic lung tissue

### B Control of respiration

1. Alveolar stretch receptors respond to inspiration by sending inhibitory impulses to inspiratory neurons in brainstem that prevent lung overdistention (Hering-Breuer reflex)
2. Central and peripheral chemoreceptors stimulate respirations in response to lowered

pH, increased  $\text{PCO}_2$ , or decreased  $\text{PO}_2$

3. Medulla oblongata and pons control rate and depth of respirations

C Amount of air exchanged in breathing

1. Directly related to gas pressure gradient between atmosphere and alveoli

2. Inversely related to resistance that opposes airflow

3. Positions such as orthopneic and semi- to high-Fowler lower abdominal organs and reduce pressure against diaphragm

4. Influenced by lung volumes and capacities (pulmonary function evaluated with a spirometer: see [Figure 7-2](#): Lung volumes and capacities)

**FIGURE 7-2** Lung volumes and capacities (illustrated by spirometry tracing). (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.).

- Tidal volume: average amount expired after a regular inspiration; expected volume is approximately 500 mL
- Expiratory reserve volume (ERV): largest additional volume of air that can be forcibly expired after a regular inspiration and expiration; expected volume is 1000 to 1200 mL
- Inspiratory reserve volume (IRV): largest additional volume of air that can be forcibly inspired after a regular inspiration; expected volume is 3000 mL
- Residual volume: air that cannot be forcibly expired voluntarily from lungs; expected volume is 1200 mL; increased in chronic obstructive pulmonary disease (COPD) as lungs lose elasticity and ability to recoil, resulting in air trapping
- Vital capacity: amount of air that can be forcibly expired after forcible inspiration; varies with size of thoracic cavity, which is determined by various factors (e.g., size of rib cage, posture, volume of blood and interstitial fluid in lungs, size of heart); expected capacity is about 4600 mL; decreased with COPD, neuromuscular disease, atelectasis
- Forced expiratory volume (FEV): volume of air that can be forcibly exhaled within a specific time, usually 1 second; expected volume is decreased with increased airway resistance (e.g., bronchospasm, COPD)
- Inspiratory capacity: largest amount of air that can be inspired after a regular exhalation; expected capacity is about 3500 mL

- h. Functional residual capacity: amount of air left in the lungs after a regular exhalation; expected capacity is about 2300 mL; increased with COPD
- i. Total lung capacity: amount of air in lungs after maximum inhalation; equal to sum of tidal volume, residual volume, and inspiratory and expiratory reserve volumes; expected capacity is about 5800 mL; increased with COPD; decreased with atelectasis and pneumonia

#### D Diffusion of gases between air and blood

1. Occurs across alveolar-capillary membranes (in lungs between air in alveoli and venous blood in lung capillaries); adequate diffusion depends on a balanced ventilation-perfusion (V/Q) ratio
2. Direction of diffusion
  - a. Oxygen: net diffusion toward lower oxygen pressure gradient (from alveolar air to blood)
  - b. Carbon dioxide: net diffusion toward lower carbon dioxide pressure gradient (from blood to alveolar air)
3. V/Q ratios
  - a. Expected: balance between alveolar ventilation and capillary blood flow to facilitate gas exchange
  - b. Low V/Q ratio: alveoli are poorly ventilated, but capillary blood flow is adequate; blood is shunted past alveoli without adequate gas exchange (e.g., atelectasis, pneumonia)
  - c. High V/Q ratio: alveolar ventilation is adequate, but capillary blood flow is not; adequate gas exchange does not take place because of dead space (e.g., pulmonary embolism, cardiogenic shock)
  - d. Absence of ventilation and perfusion: causes a silent unit with no gas exchange (e.g., pneumothorax)

E Blood transports oxygen as a solute and primarily as oxyhemoglobin; oxygen saturation of hemoglobin ( $\text{SaO}_2$ ) is 95% to 100%

#### F Blood transports carbon dioxide

1. Primarily as a bicarbonate ion ( $\text{HCO}_3^-$ ) formed by ionization of carbonic acid; in lungs the molecule splits in the presence of carbonic anhydrase to form carbon dioxide ( $\text{CO}_2$ ) and water ( $\text{H}_2\text{O}$ );  $\text{CO}_2$  diffuses into the alveoli and the majority of water is retained
2. As a solute in plasma
3. In combination with hemoglobin (carboxyhemoglobin)

#### G Normal breath sounds ([Figure 7-3](#): Breath sounds in the ill and well client)

**FIGURE 7-3** Breath sounds in the ill and well client. (From Seidel et al: *Mosby's guide to physical examination*, ed 7, St. Louis, 2011, Mosby.)

1. Bronchial sounds (over trachea, larynx): result of air passing through larger airways; sounds are loud, harsh, high-pitched; expiration longer than inspiration
2. Vesicular sounds (over entire lung field except large airways): result of air moving in and out of alveoli; may reflect sound of air in larger passages that is transmitted through lung tissue; sounds are quiet, low-pitched; inspiration longer than expiration
3. Bronchovesicular sounds (near main stem bronchi); result of air moving through smaller air passages; sounds are moderately pitched, breezy; inspiratory and expiratory phases equal

#### H Adventitious breath sounds (see [Figure 7-3](#))

1. Fine crackles
  - a. Result of sudden opening of small airways and alveoli that contain fluid
  - b. Short, high-pitched bubbling sounds; sounds may be simulated by rubbing a few strands of hair between fingers next to the ear
  - c. Most common during height of inspiration
  - d. Associated with pneumonia and pulmonary edema
2. Coarse crackles
  - a. Rush of air passing through airway intermittently occluded by mucus
  - b. Short, low-pitched bubbling sounds
  - c. Most common on inspiration and at times expiration
  - d. Associated with pneumonia, COPD, and pulmonary edema
3. Wheezes
  - a. Result of air passing through narrowed small airways
  - b. Sounds are high-pitched and musical (sibilant wheezes), or low-pitched and rumbling (sonorous wheezes or rhonchi)
  - c. Most common on expiration
  - d. Associated with asthma and with conditions that cause partial obstruction of

airway by mucus, foreign body, or tumor

#### 4. Pleural friction rub

- a. Result of roughened pleural surfaces rubbing across each other
- b. Sounds are crackling, grating
- c. Most common during height of inspiration
- d. Associated with conditions that cause inflammation of pleura

## Review of Microorganisms

### A Bacterial pathogens

1. *Bordetella pertussis*: small, gram-negative coccobacillus; causes pertussis or whooping cough
2. *Streptococcus pneumoniae*: gram-positive, encapsulated diplococcus; causes pneumococcal pneumonia; often responsible for sinusitis, otitis media, and meningitis
3. *Haemophilus influenzae*: small, gram-negative, highly pleomorphic bacillus; causes acute meningitis and upper respiratory tract infections
4. *Klebsiella pneumoniae* (Friedländer's bacillus): gram-negative, encapsulated, non-spore-forming bacillus; causes pneumonia and urinary tract infections
5. *Mycobacterium tuberculosis* (tubercle bacillus): acid-fast actinomycete causes tuberculosis (TB)
6. *Pseudomonas aeruginosa*: gram-negative, non-spore-forming bacillus; often cause of facility-acquired infections; respiratory equipment can be source; causes pneumonia, urinary tract infections, and sepsis that complicates severe burns
7. *Staphylococcus aureus*: gram-positive coccus; misuse of antimicrobial agents led to emergence of methicillin-resistant *Staphylococcus aureus* (MRSA)

B Rickettsial pathogen: *Coxiella burnetii*; only *Rickettsia* species not associated with a vector; causes Q fever, an infection clinically similar to primary atypical pneumonia

### C Viral pathogens

1. DNA viruses: adenoviruses cause acute respiratory tract disease, adenitis, pharyngitis, and other respiratory tract infections, as well as conjunctivitis
2. RNA viruses
  - a. Coronaviruses: frequently associated with a mild upper respiratory tract infection; severe acute respiratory syndrome (SARS) associated coronavirus (SARS-CoV) causes an atypical pneumonia with a high morbidity and mortality
  - b. Picornaviruses: cause poliomyelitis, Cocksackie disease, common cold
  - c. Retroviruses: invade T lymphocytes and are associated with malignancies, human immunodeficiency virus (HIV), and acquired immunodeficiency syndrome (AIDS)
  - d. Orthomyxoviridae (influenza viruses): frequently associated with influenza (flu); a novel strain of influenza A virus (H1N1) was responsible for the 2009 flu pandemic

### D Fungal pathogens

1. *Histoplasma capsulatum*: dimorphic fungus producing chlamydospores in infected tissue; causes histoplasmosis

2. *Aspergillus fumigatus*: rapidly proliferating fungus found in soil; inhalation of spores can cause pneumonia
3. *Pneumocystis jiroveci*: unicellular organism thought to be transmitted by airborne droplets; causes pneumonia

## Related Pharmacology

### ***Bronchodilators and Antiasthmatics***

#### A Description

1. Reverse bronchoconstriction, thus opening air passages in lungs
2. Stimulate beta-adrenergic sympathetic nervous system receptors, relaxing bronchial smooth muscle, or inhibiting inflammation and reducing edema
3. Available in oral, parenteral (intramuscular [IM], subcutaneous [Sub-Q], IV), rectal, and inhalation preparations

#### B Examples

1. Beta agonists act at beta-adrenergic receptors in bronchi and bronchioles to relax smooth muscle; this increases respiratory volume and inhibits histamine release from mast cells suppressing reaction to allergens; e.g., albuterol (Proventil); isoproterenol (Isuprel); epiNEPHrine (Adrenalin, Sus-Phrine); metaproterenol (Alupent); terbutaline (Brethine); salmeterol (Serevent), which is long-acting
2. Xanthines act directly on bronchial smooth muscle, decreasing spasm and relaxing smooth muscle of the vasculature; are used less frequently because of side effects and drug interactions; e.g., aminophylline, theophylline (Elixophyllin, Theo-Dur), oxtriphylline (Choledyl), dyphylline (Dilor)
3. Anticholinergics inhibit action of acetylcholine at receptor sites on bronchial smooth muscle and prevent bronchospasm; e.g., ipratropium (Atrovent)
4. Inhaled steroids exert antiinflammatory effect on airways; e.g., fluticasone (Flovent, Flonase); budesonide (Pulmicort Turbuhaler); beclomethasone (Beclovent, Beconase, Vanceril); triamcinolone (Azmacort); combination product—fluticasone and salmeterol (Advair Diskus)
5. Leukotriene receptor antagonists block action of leukotriene to reduce bronchoconstriction and inflammation associated with asthma; e.g., montelukast (Singulair), zafirlukast (Accolate), zileuton (Zyflo)

C Major side effects: dizziness (decrease in blood pressure); central nervous system (CNS) stimulation (sympathetic stimulation); palpitations and hypertension (beta-adrenergic stimulation); gastric irritation (local effect)

#### D Nursing care

1. Question if prescribed for clients with hypertension, hyperthyroidism, and cardiovascular dysfunction
2. Question if prescribed concurrently with CNS stimulants (adrenergics) and bronchoconstricting agents (beta blockers)
3. Administer with food during waking hours
4. Assess vital signs, breath sounds, oxygen saturation with pulse oximeter

5. Assess intake and output (I&O)
6. Teach use of metered-dose inhalers (MDIs), spacers, and peak flow meters: rinse mouthpiece, cap, and mouth after each use; oropharyngeal fungal infections are common with inhaled steroids
7. Explain importance of adhering to therapy to decrease need for short-acting beta agonists
8. Explain that stimulants and some over-the-counter medications should be avoided because they may act as antagonists

## ***Mucolytic Agents and Expectorants***

### **A Description**

1. Liquefy secretions in respiratory tract, promoting a productive cough
2. Mucolytics act directly to break up mucus plugs in tracheobronchial passages; available in inhalation preparations (oral form of acetylcysteine is used to treat acetaminophen toxicity)
3. Expectorants act indirectly to liquefy mucus by increasing respiratory tract secretions via oral absorption; available in oral preparations

**B Examples:** mucolytic—acetylcysteine (Mucomyst); expectorants—guaifenesin (Mucinex); potassium iodide (SSKI)

**C Major side effects:** gastrointestinal (GI) irritation (local effect); skin rash (hypersensitivity); oropharyngeal irritation and bronchospasm with mucolytics

### **D Nursing care**

1. Promote adequate fluid intake
2. Encourage coughing and deep breathing
3. Avoid offering fluids immediately after administering liquid expectorants
4. Assess respiratory status
5. Have suction apparatus available

## ***Antitussives***

### **A Description**

1. Suppress cough reflex
2. Inhibit cough reflex either by direct action on medullary cough center or by indirect action peripherally on sensory nerve endings
3. Available in oral preparations

**B Examples:** opioid—codeine, hydrocodone (Hycodan); dextromethorphan hydrobromide (Robitussin), benzonatate (Tessalon); diphenhydrAMINE (Benadryl) is an antihistamine that may be used for coughs

**C Major side effects:** drowsiness (CNS depression); nausea (GI irritation); dry mouth (anticholinergic effect of antihistamine in combination products)

### **D Nursing care**

1. Provide adequate fluid intake
2. Avoid offering fluids immediately after administering liquid preparations

3. Encourage high-Fowler position
4. Question if prescribed postoperatively, concurrently with CNS depressants, or for clients with a head injury or asthma
5. Maintain safety precautions after administration; teach to avoid hazardous activity

## ***Opioid Antagonist***

### A Description

1. Displace opioids at respiratory receptor sites via competitive antagonism
2. Reverse respiratory depression caused by opioid overdose
3. Available in parenteral (IV, Sub-Q, IM) preparations

### B Example: naloxone

### C Major side effects: CNS depression (acts on opioid receptors in CNS); nausea, vomiting

### D Nursing care

1. Assess vital signs, especially respirations
2. Have oxygen and emergency resuscitative equipment available
3. Continue to monitor after effects of naloxone wear off because opioids have a longer duration of action

## ***Antihistamines***

### A Description

1. Block action of histamine at H<sub>1</sub> receptor sites via competitive inhibition; exert antiemetic, anticholinergic, and CNS depressant effects
2. Relieve symptoms of the common cold and allergies that are mediated by histamine
3. Available in oral and parenteral (IM, IV) preparations

### B Examples: brompheniramine (Dimetane); diphenhydramine (Benadryl); loratadine (Claritin); fexofenadine (Allegra); cetirizine (Zyrtec)

### C Major side effects

1. Drowsiness and dizziness particularly for first-generation antihistamines (CNS depression); GI irritation (local effect); dry mouth (anticholinergic effect)
2. Excitement (paradoxical effect)

### D Nursing care

1. Question if prescribed concurrently with CNS depressants
2. Teach to avoid engaging in hazardous activities
3. Administer with food or milk to avoid GI irritation
4. Offer gum or hard candy to promote salivation
5. Teach to avoid using antihistamines as a hypnotic, especially older adults

## ***Antituberculars***

### A Description

1. Treat TB; administered in combination (first-line and second-line drugs) over a prolonged time period to reduce possibility of mycobacterial drug resistance
2. Available in oral and parenteral (IM) preparations

## B Examples

### 1. First-line drugs

- a. Ethambutol (Myambutol): interferes with mycobacterial RNA synthesis
- b. Isoniazid (INH, Nydrazid): interferes with mycobacterial cell-wall synthesis
- c. Pyrazinamide (PZA): bacteriostatic; mechanism unknown
- d. Rifampin (Rifadin), rifabutin (Mycobutin), rifapentine (Priftin): interfere with mycobacterial RNA synthesis
- e. Streptomycin sulfate: inhibits mycobacterial protein synthesis
- f. Combination drugs: isoniazid (INH)/rifampin (Rifamate); INH/rifampin/PZA (Rifater)

### 2. Second-line drugs inhibit mycobacterial cell metabolism: capreomycin (Capastat) and cycloserine (Seromycin)

## C Major side effects

1. GI irritation (direct tissue irritation)
2. Suppressed absorption of fat and B complex vitamins, especially folic acid and B<sub>12</sub>; depletion of vitamin B<sub>6</sub> by INH
3. Dizziness (CNS effect)
4. CNS disturbances (direct CNS toxic effect)
5. Hepatotoxicity (direct liver toxic effect)
6. Blood dyscrasias (decreased red blood cells [RBCs], white blood cells [WBCs], platelet synthesis)
7. Streptomycin: ototoxicity (direct auditory [eighth cranial] nerve toxic effect); nephrotoxicity
8. Ethambutol: visual disturbances (direct optic [second cranial] nerve toxic effect)
9. Rifampin: orange-red discoloration of all body fluids; increases metabolism of corticosteroids, opioids, warfarin (Coumadin), oral contraceptives, and hypoglycemics
10. INH: inhibits phenytoin metabolism; peripheral neuritis

## D Nursing care

1. Support natural defense mechanisms; encourage intake of foods rich in immune-stimulating nutrients (e.g., vitamins A, C, and E, and the minerals selenium and zinc)
2. Obtain sputum specimens for acid-fast bacillus
3. Monitor blood work during therapy (e.g., liver enzymes)
4. Instruct to take medications as prescribed; reinforce need for medical supervision; when adherence to the therapeutic regimen is an issue, mandated directly observed therapy ensures treatment is ongoing
5. Offer emotional support during long-term therapy
6. Use safety precautions (e.g., supervise ambulation) if CNS effects are manifested
7. Instruct regarding nutritional side effects of medications and encourage foods rich in B complex vitamins
8. Encourage to avoid alcohol during therapy
9. Ethambutol: encourage frequent visual examinations
10. Rifampin: teach that body fluids may appear orange-red; monitor for drug interactions; decreases effectiveness of oral contraceptives

11. Streptomycin: encourage frequent auditory examinations
12. INH: administer pyridoxine as prescribed to prevent neuritis
13. Instruct to avoid exposing others to respiratory droplets from coughing and to dispose of tissues in a moisture-proof container until no longer contagious (2 to 8 weeks)
14. Evaluate response to medication

## Related Procedures

### ***Abdominal Thrust (Heimlich Maneuver)***

A Definition: short, abrupt pressure against abdomen, two fingerbreadths above umbilicus, to raise intrathoracic pressure; external compression forces out residual lung volume, which will dislodge the obstruction, such as a bolus of food or a foreign body

B Signs and symptoms of obstruction

1. Partial: noisy respirations, stridor, dyspnea, light-headedness, dizziness, flushing of face, bulging of eyes, repeated coughing
2. Total: universal choking sign (thumb and forefinger encircling throat), cessation of breathing, inability to speak or cough, extension of head, facial cyanosis, bulging of eyes, panic, unconsciousness

C Nursing care

1. Assess no longer than 3 to 5 seconds
  - a. Ask, "Are you choking?"
  - b. Determine whether person can speak or cough
  - c. Observe for universal choking sign
  - d. Assess respirations: observe for rise and fall of chest; listen for escape of air from nose and mouth on expiration; feel for flow of air from nose and mouth
2. Initiate intervention for a partial obstruction
  - a. Allow individual's expulsive cough to dislodge obstruction
  - b. Remove foreign bodies coughed up into the mouth
  - c. Assess for signs of total obstruction
  - d. Activate emergency medical service (EMS) system if person is having difficulty breathing
3. Initiate intervention for a total obstruction
  - a. Standing behind the conscious person, encircle waist and thrust upward and inward against diaphragm with intertwined clenched fists; repeat thrusts until object is expelled or the person becomes unresponsive
  - b. If person becomes unconscious, activate EMS system
  - c. Begin cardiopulmonary resuscitation (CPR)
  - d. Determine patency of airway; remove foreign objects from mouth; attempt rescue breathing
  - e. If an airway cannot be established, an emergency cricothyrotomy may be necessary

# ***Bronchoscopy***

## A Definition

1. Visualization of tracheobronchial tree via a scope advanced through mouth or nose into bronchi
2. Performed to remove foreign body, remove secretions, or obtain specimens of tissue or mucus for diagnostic study

## B Nursing care

1. Obtain informed consent
2. Keep nothing by mouth (NPO) for 6 to 8 hours before procedure
3. Administer prescribed preprocedure medications to produce sedation and decrease anxiety
4. Inform to expect some soreness, dysphagia, and hemoptysis after procedure
5. Advise to avoid coughing or clearing throat
6. Observe for signs of hemorrhage and/or respiratory distress; keep head of bed elevated
7. Monitor vital signs until stable
8. Do not allow fluids until gag reflex returns; protect airway until local anesthetic dissipates

# ***Chest Physiotherapy***

A Definition: activities to mobilize respiratory secretions that may lead to atelectasis and/or pneumonia

## B Types of interventions

1. Incentive spirometer: mechanical device that promotes maximum inspiration and loosens secretions; measures air inspired, provides visual feedback
2. Percussion (clapping): cupped hands repeatedly strike chest wall over congested areas; loosens secretions
3. Vibration: palmar surface of hands placed on chest over congested area and vibrated as client exhales; loosens secretions
4. Postural drainage: placed in various positions to permit gravity drainage of congested lung segments

## C Nursing care

1. Assess baseline breath sounds, oxygen saturation with pulse oximeter (maintain at 90% or more), and ability to tolerate procedure
2. Administer prescribed bronchodilators, mucolytics, analgesics
3. Position client
  - a. Fowler position for incentive spirometry and to drain upper lung segments
  - b. Side-lying and prone positions with head lower than affected segment for postural drainage
4. Teach use of incentive spirometer
  - a. After exhaling, form seal around mouthpiece with lips
  - b. Take slow, continuous deep breath and hold indicator afloat for several seconds before exhaling

c. Repeat 10 times per hour or as per protocol

5. Perform percussion and vibration for several minutes over affected areas being managed with postural drainage
6. Encourage coughing and expectoration of secretions; provide tissues and appropriate receptacle
7. Allow rest periods as needed; avoid scheduling near meal times
8. Evaluate color and amount of secretions and quality of breath sounds after procedure
9. Encourage a 2- to 3-L fluid intake daily to liquefy secretions

## Chest Tubes

### A Definition

1. Placement of tubes and use of suction to return negative pressure to intrapleural space; expands lungs by removing positive pressure from pleural space
2. Placement of tube in second or third intercostal space removes air from intrapleural space
3. Placement of tube at a lower site, usually eighth or ninth intercostal space, drains blood or fluid from intrapleural space ([Figure 7-4: Chest tube placement](#))

**FIGURE 7-4** Chest tube placement. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.)

### B Commercial drainage systems

1. Wet suction water-seal drainage system (e.g., PleurEvac, Atrium Ocean ([Figure 7-5, A and B: Chest drainage systems](#)))

**FIGURE 7-5** Chest drainage systems. (A, From Ignatavicius DD, Workman ML: *Medical-surgical nursing: critical thinking for collaborative care*, ed 6, St. Louis, 2010.) (B and C, From Black JM, Hawks JH: *Medical-surgical nursing: clinical management for positive outcomes*, ed 8, St. Louis, 2009, Saunders.)

- a. Calibrated collection chamber for drainage
  - b. Water-seal chamber: prevents atmospheric air from entering pleural space; fluid level fluctuates with respirations until lung is fully expanded; continuous bubbling may indicate air leak; requires instillation of sterile water to 2-cm level when being set up for use
  - c. Suction control chamber: controls amount of suction, requires instillation of sterile fluid usually to 20 cm level; steady bubbling indicates suction level is maintained
2. Dry suction water-seal drainage system (e.g., Atrium Oasis): has three chambers like water-seal drainage, but does not require fluid in suction control chamber; quieter than traditional water-seal drainage (Figure 7-5, C: Chest drainage systems)
  3. One-way valve systems (e.g., Heimlich valve): used to remove air and small amounts of fluid from pleural space; valve prevents air from reentering pleural space

#### C Nursing care

1. Monitor respiratory status (e.g., respiratory rate, depth, and rhythm; use of accessory muscles; oxygen saturation; breath sounds)
2. Ensure that tubing is not kinked and is positioned on mattress to avoid dependent loops; tape all connections to prevent separation
3. “Milking and stripping” chest tubes is contraindicated because it increases negative intrapleural pressure; it does not significantly affect tube patency
4. Maintain drainage system below level of chest
5. Turn client frequently; ensure that chest tubes are not compressed and are free of restrictions to prevent accidental dislodgement
6. Monitor and mark drainage in system; report drainage on dressing immediately, since this is not expected
7. Observe for fluctuation of fluid in water-seal chamber (tidaling); level will rise on inhalation and fall on exhalation; if there are no fluctuations, either the lung has expanded fully or the chest tube is clogged; length of time for lung expansion depends on etiology

8. Palpate area around chest tube insertion site for crepitus, which indicates that air is leaking into subcutaneous tissue (subcutaneous emphysema)
9. Situate drainage system to avoid being tipped over (e.g., hung from frame of bed, in stand that comes with device, on flat surface)
10. Place two clamps at bedside for use when changing systems or if a leak is suspected; clamps are used judiciously and only in emergency situations because they can cause tension pneumothorax
11. Encourage movement, coughing, and deep breathing every 2 hours, splinting as needed; assess breath sounds; effective pain management improves performance
12. Assess for tracheal deviation, a sign of tension pneumothorax
13. Confirm that chest radiography was done before removal of chest tubes
14. If wall suction is stopped, ensure that system is open to atmosphere so air from the pleural space can escape
15. Instruct to exhale or bear down while holding breath (Valsalva maneuver) as tube is withdrawn; apply a gauze dressing immediately and firmly secure to make an airtight dressing

## ***Mechanical Ventilation***

A Definition: mechanical device to maintain ventilation and oxygenation using positive or negative pressure

B Types of ventilators

1. Negative pressure ventilators create a negative pressure chamber around the chest decreasing intrathoracic pressure to allow for passive inhalation; used infrequently (e.g., chest cuirass fitted to the individual [a refinement of the iron lung])
2. Positive pressure ventilators
  - a. Pressure-cycled: delivers a volume of gas with positive pressure during inspiration; used for short term
  - b. Volume-cycled: delivers a preset tidal volume of inspired gas regardless of pressure; most commonly used
  - c. Time-cycled: delivers volume of gas for a predetermined inspiratory time; not generally used for adults

C Modes of ventilation

1. Controlled mandatory ventilation (CMV): specified volume and rate of gas is delivered with no triggering of the machine by the client; medications may be administered to decrease client's respiratory response (e.g., pancuronium bromide [Pavulon], morphine)
2. Assist-control ventilation (ACV): client's inhalations trigger machine to deliver a preset volume; as a result the rate may vary; however, if apnea occurs, the machine will initiate respirations at a preset tidal volume and rate
3. Intermittent mandatory ventilation (IMV): a predetermined tidal volume and number of breaths per minute are delivered; client controls respirations between mechanical ventilations; rate can be gradually reduced as client is weaned from ventilator; rarely used

4. Synchronized intermittent mandatory ventilation (SIMV): same as IMV but ventilator breaths are synchronized with client's breaths; often used for weaning
5. Pressure support ventilation (PSV): client initiates all breaths, which are then supplemented by positive pressure, improving tidal volume and reducing respiratory efforts; may be used alone or with SIMV or continuous positive airway pressure (CPAP)
6. Positive end-expiratory pressure (PEEP): maintains positive pressure at the end of expiration to keep alveoli open, increasing functional residual capacity (FRC)
7. Proportional assist ventilation (PAV): synchronizes with and augments client's inspiratory efforts proportionately; rarely used
8. CPAP: similar to PEEP but exerts positive pressure throughout respiratory cycle; client must be breathing spontaneously; used with intubation during weaning from a ventilator; used without intubation, but with a tight-fitting face or nose mask; used for sleep apnea or heart failure
9. Bi-level positive airway pressure ventilation mode (BiPAP): noninvasive method to deliver air through nose and mouth; inspiratory positive airway pressure (IPAP) and expiratory positive airway pressure (EPAP) are different; will deliver breath if client's rate falls below preset frequency

#### D Nursing care

1. Maintain ventilator settings and notify respiratory department and health care provider if distress occurs
2. Maintain sealed system between ventilator and client so that volume to be delivered is kept constant and air is not lost around tubing; this is accomplished by inflating the cuff of the endotracheal tube or tracheostomy tube to the minimum occlusive volume
3. Prevent high-pressure alarm: perform suction as needed (humidified oxygen helps liquefy secretions); use bite block if client is biting endotracheal tube; consult with health care provider about need for sedative or neuromuscular blocking agent if client seems to "fight" or "buck" ventilator
4. Prevent low-pressure alarm: secure connections between tubes and ventilator, maintain endotracheal or tracheostomy tube cuff pressure; may need to ventilate manually if caused by ventilator problem
5. Assess for signs of respiratory insufficiency (e.g., adventitious breath sounds, hypoventilation, tachypnea, cyanosis, changes in sensorium)
6. Check pulse oximeter and blood gases to determine effectiveness of ventilation
7. Establish means of communication because client will be unable to speak while on a ventilator
8. Provide oral care, and suction oral cavity as needed
9. Provide tracheostomy care or endotracheal tube care as per agency policy
10. Participate with respiratory therapist to gradually increase spontaneous breathing trials (SBTs) to wean hemodynamically stable client from ventilator; may use CPAP for support; a T-piece can be used to supply supplemental oxygen through the artificial airway during trials

## Oxygen therapy

A Definition: supplemental oxygen to prevent or treat tissue hypoxia

B Methods: depend on client's condition

1. Nasal cannula: 1 to 6 L/min (24% to 43%); least restrictive
2. Simple mask: 5 to 8 L/min (40% to 60%)
3. Partial rebreathing mask: 8 to 11 L/min (50% to 90%)
4. Nonrebreather mask: 12 to 15 L/min (90% to 100%)
5. Venturi mask: delivers precise percentage of oxygen inspired (Figure 7-6: Venturi mask)

**FIGURE 7-6** Venturi mask. (From Potter PA, Perry AG: *Fundamentals of nursing*, ed 7, St. Louis, 2009, Mosby.)

C Nursing care

1. Monitor for signs of hypoxia (e.g., agitation, confusion, lethargy, pallor, diaphoresis, tachycardia, cyanosis [late])
2. Monitor arterial oxygen saturation with pulse oximeter
  - a. Attach sensor, usually to finger or earlobe; avoid extremity with impediment to blood flow
  - b. Check preset alarm for oxygen saturation ( $\text{SaO}_2$ ); if less than 85%, adjustment is needed
3. Maintain safety precautions because oxygen supports combustion (e.g., ensure that all health team members are aware of oxygen in use, examine electrical devices for faulty wiring; be aware of location of fire extinguishers and oxygen turn-off valve)
4. Verify that client does not have COPD before administering a high concentration of oxygen because  $\text{CO}_2$  narcosis may develop

5. Ensure that oxygen with a flow rate greater than 4 L/min is humidified to prevent drying of secretions
6. Specific care related to method
  - a. Cannula—care for nares with water-soluble lubricant; ensure that client is not a mouth breather
  - b. Rebreather masks—ensure that bag does not deflate completely
  - c. Venturi mask—set L/min to deliver specified  $\text{FiO}_2$ ; use appropriate adapter or setting on attachment to mix room air with oxygen; ensure ports are not obstructed

## ***Suctioning of Airway***

### **A Definition**

1. Mechanical aspiration of mucous secretions from tracheobronchial tree by application of negative pressure
2. Helps to maintain a patent airway, obtain a sputum specimen, or stimulate coughing
3. May be nasotracheal, oropharyngeal, or through an endotracheal or tracheostomy tube

### **B Nursing care**

1. Place in semi-Fowler position
2. Obtain vital signs and auscultate breath sounds for presence of secretions
3. Assess functioning of equipment before and after use
4. Hyperoxygenate before suctioning by increasing flow rate; encourage deep breathing or manually ventilate with 100% oxygen
5. Lubricate sterile suction catheter with sterile saline, water, or water-soluble gel
6. Insert catheter: if tracheal suction is being used, insert to end of tube (approximately 4 inches); if nasotracheal suction is being used, insert until cough reflex is induced or resistance is met; when resistance is met, withdraw catheter 2 cm before initiating suction
7. Do not apply negative pressure while catheter is being inserted
8. Rotate and withdraw catheter while negative pressure is applied; do not exceed 10 to 15 seconds
9. Clear catheter with sterile solution and encourage to breathe deeply
10. Discontinue suctioning and hyperoxygenate for distress or oxygen desaturation; reassess vital signs and breath sounds

## ***Thoracentesis***

### **A Definition**

1. Removes fluid or air from pleural space to alleviate respiratory distress or obtain a specimen for diagnostic purposes; needle biopsy of pleura may be performed
2. No more than 1000 mL of fluid should be removed at a time; fluid withdrawn should be sent to laboratory for culture and sensitivity, analysis of glucose and protein levels, and pH determination
3. Complications include pneumothorax from trauma to lung and pulmonary edema

resulting from sudden fluid shifts

#### B Nursing care

1. Obtain informed consent
2. Ensure chest x-ray examination is performed before and after procedure
3. Assess vital signs before, during, and after procedure
4. Inform not to cough during procedure to prevent trauma to lungs
5. Support in the sitting position
6. Identify and record amount, color, and clarity of withdrawn fluid
7. Position on opposite side for 1 hour after the procedure to promote lung expansion if tolerated
8. Observe for coughing, decreased breath sounds, bloody sputum, and rapid pulse rate and report their occurrence immediately
9. Monitor for subcutaneous emphysema (crepitus)

### **Tracheostomy Care**

A Definition: removal of dried secretions in and around tracheal cannula, maintaining a patent airway, preventing infection, and irritation

#### B Nursing care

1. Perform tracheostomy care at least every 8 hours
2. Suction to remove secretions from lumen of tube (see [Suctioning of Airway under Related Procedures](#))
3. Clean inner cannula if present
  - a. Remove disposable inner cannula and replace with new one using sterile technique
  - b. Care for nondisposable inner cannula using surgical aseptic technique: remove and place in soaking solution; remove secretions within cannula with a sterile brush; rinse with normal saline; drain excess saline before reinserting tube; lock inner cannula in place
4. Clean around stoma with saline, using sterile technique; apply antiseptic ointment if ordered
5. Change tracheostomy ties with commercially available Velcro ties or twill tape cut to size, being careful not to dislodge cannula; request assistance to secure tracheostomy tube; secure twill tape ties with double knot
6. Place tracheostomy dressing or fenestrated 4-by-4-inch (unfilled) dressing below stoma to absorb expelled secretions
7. Humidify inhaled air if ordered because air is bypassing usual humidification process in the nasopharynx

# Major Disorders of the Respiratory System

## Pulmonary Embolism and Infarction

### ***Data Base***

#### A Etiology and pathophysiology

1. Emboli develop from thrombi in peripheral circulation or right side of heart; peripheral emboli travel and obstruct the pulmonary artery or its branches
2. Pulmonary infarction: when an embolus lodges in the pulmonary artery causing hemorrhage and necrosis of lung tissue
3. Venous thromboembolism (VTE): when a pulmonary embolism is associated with a deep vein thrombosis
4. Associated with venous stasis resulting from immobility, coagulopathy, vascular disease, surgery, aging, oral contraceptives, obesity, trauma, pregnancy, diabetes, and constrictive clothing

#### B Clinical findings

1. Subjective: sudden onset of severe dyspnea; anxiety; restlessness; sharp pleuritic chest pain (often unilateral)
2. Objective
  - a. Increased temperature, pulse rate, and respirations; violent coughing with hemoptysis; diaphoresis
  - b. Spiral computed tomography (CT) scans of the chest, V/Q scans, and pulmonary angiography identify nonperfused areas of the lung; D-dimer assay to identify end products of fibrin clot degradation in venous blood, a marker for venous clots

#### C Therapeutic interventions

1. Anticoagulation with IV heparin (based on body weight) and warfarin (Coumadin) until international normalization ratio (INR) is therapeutic; warfarin is used for maintenance therapy
2. Thrombolytic therapy if respiratory status is severely compromised; alteplase (Activase), tissue plasminogen activator (t-PA)
3. Angiography; if condition is severe, an embolectomy may be indicated
4. Vena cava interruption; a filter (Greenfield or umbrella) may be implanted in inferior vena cava, preventing passage of large thrombi
5. Infusion of DOBUTamine (Dobutrex) for hypotension

### ***Nursing Care of Clients with Pulmonary Embolism and Infarction***

#### **Assessment/Analysis**

1. Possible causative factors, especially surgery of the pelvic floor or lower extremities
2. Presence of clinical findings

#### **Planning/Implementation**

1. Place in high-Fowler position, administer oxygen
2. Auscultate breath sounds, monitor oxygen saturation, and electrocardiogram (ECG)
3. Monitor for signs and symptoms of hypoxemia and right heart failure
4. Administer prescribed thrombolytics/anticoagulants; monitor for bleeding
5. Administer analgesics to reduce pain and decrease anxiety
6. Maintain calm environment
7. Educate regarding anticoagulants and prevention of thrombophlebitis

## **Evaluation/Outcomes**

1. Maintains acceptable breathing patterns
2. Maintains adequate tissue perfusion
3. Verbalizes feelings of control over situation

## **Pulmonary Edema**

### **Data Base**

#### **A Etiology and pathophysiology**

1. Rapid accumulation of fluid in lung tissue and alveolar spaces, resulting from increased hydrostatic pressure within pulmonary system; an acute emergency
2. Causes: left ventricular failure secondary to myocardial infarction; valvular disease; hypertension; circulatory overload secondary to acute renal failure/chronic kidney disease or syndrome of inappropriate antidiuretic hormone (SIADH)

#### **B Clinical findings**

1. Subjective: history of shortness of breath, paroxysmal nocturnal dyspnea, wheezing, and orthopnea; acute anxiety, apprehension, restlessness
2. Objective
  - a. Rapid, thready pulse; tachypnea; pink, frothy sputum; wheezing; crackles; pallor or cyanosis; cold, clammy skin; jugular vein distension (JVD)
  - b. Low  $PO_2$ ; elevated brain natriuretic peptide (BNP), central venous pressure (CVP), and pulmonary artery diastolic and wedge pressures

#### **C Therapeutic interventions**

1. Oxygen in high concentrations may require intubation and mechanical ventilation
2. Fowler position
3. Morphine to reduce anxiety and peripheral resistance
4. Medications to reduce preload and afterload: diuretics to reduce fluid volume; nitroglycerin (nitroprusside [Nipride] or nesiritide [Natrekor]) for vasodilation
5. Treatment of underlying causes
6. Hemodynamic monitoring and possible intraaortic balloon pump (IABP)

### **Nursing Care of Clients with Pulmonary Edema**

## **Assessment/Analysis**

1. Presence of clinical findings (e.g., crackles, wheezes, JVD, frothy or blood-tinged sputum, decreased oxygen saturation)
2. Signs and symptoms of hypoxemia
3. Precipitating factors

## Planning/Implementation

1. Support in orthopneic, high-Fowler, or semi-Fowler position with legs dependent
2. Monitor and record vital signs, oxygen saturation, ECG, and I&O
3. Maintain a reassuring environment and administer morphine to allay anxiety
4. Administer oxygen; suction secretions as needed to maintain a patent airway
5. Administer and monitor effects of medications that reduce preload and afterload
6. Prevent complications of bed rest (e.g., pressure ulcers, venous stasis, constipation, deconditioning)
7. Educate regarding pharmacologic regimen and prevention of heart failure

## Evaluation/Outcomes

1. Demonstrates activity tolerance within level of cardiac function
2. Maintains adequate gas exchange
3. Verbalizes decreased anxiety

## Pneumonia

### Data Base

#### A Etiology and pathophysiology

1. Inflammatory disease of lung; may have a collection of pus (empyema), fluid (pleural effusion), or consolidation within pleural space
2. Caused by infectious agent (e.g., bacterial, viral, or fungal) but also may be caused by inhalation of chemicals or aspiration of gastric contents
  - a. Community-acquired pneumonia (CAP): commonly caused by *S. pneumoniae* (pneumococcal), *H. influenzae*, *Legionella pneumophila*, *M. pneumoniae*, *Chlamydia* species (*C. pneumoniae*; *C. psittaci*); viruses
  - b. Hospital-acquired pneumonia (HAP): commonly caused by *S. aureus*, *P. aeruginosa*, *K. pneumoniae*, *Serratia marcescens*, *S. pneumoniae* (pneumococcal), *H. influenzae*; misuse of antimicrobial agents led to emergence of resistant strains such as MRSA
  - c. Aspiration pneumonia: occurs when resident flora of upper respiratory tract, gastric contents, or chemicals are aspirated into lung
  - d. Pneumonias in immunocompromised hosts: commonly associated with *Pneumocystis pneumonia* (PCP) caused by *P. jiroveci* and other fungal pneumonias (e.g., aspergillosis) and *M. tuberculosis*
  - e. Severe acute respiratory syndrome (SARS): atypical pneumonia caused by a coronavirus (SARS-CoV); 1993 outbreak started in Asia and spread globally
3. Risk factors: age (older adult), COPD, alcoholism, smoking, neutropenia, ineffective

cough, immobility, HIV infection, endotracheal intubation

4. Pneumonia commonly spread by respiratory droplets

#### B Clinical findings

1. Subjective: lassitude; dyspnea; chest pain that increases on inspiration

2. Objective

a. Elevated temperature, increased WBCs

b. Chest x-ray shows pulmonary infiltration

c. Cough with sputum production; culture identifies pathogen

(1) Pneumococcal: purulent, rusty sputum

(2) Staphylococcal: yellow, blood-streaked sputum

(3) *Klebsiella* species: red, gelatinous sputum

(4) Mycoplasmal: nonproductive that advances to mucoid sputum

#### C Therapeutic interventions

1. Culture and sensitivity tests on blood and sputum to determine appropriate antibiotic; specimen must be obtained before antimicrobial therapy is started

2. Antimicrobial therapy initiated within 6 hours of arrival at hospital: antibiotics, antiviral, or antifungal therapy; *Aspergillus* infection is treated with amphotericin B, azole agents such as itraconazole (Sporanox), or newer echinocandin agents such as caspofungin (Cancidas)

3. Respiratory support including oxygen, intubation, and ventilation as needed

4. Nutritional supplementation and fluid and electrolyte replacement

5. Bronchodilators

6. Chest physiotherapy and suctioning as needed

7. For SARS: no effective vaccine or treatment identified; supportive care

8. Global surveillance plan to limit spread (e.g., influenza, SARS)

### **Nursing Care of Clients with Pneumonia**

#### **Assessment/Analysis**

1. Vital signs, breathing patterns, oxygen saturation

2. Color, amount, and consistency of sputum

3. Adventitious sounds on auscultation of lung

4. Mental status changes

#### **Planning/Implementation**

1. Encourage coughing and deep breathing after chest physiotherapy, splinting chest as necessary

2. Collect morning sputum specimen for culture and sensitivity tests in sterile container; notify health care provider if organism is resistant to antibiotic prescribed

3. Increase fluid intake to 3 L daily to thin secretions

4. Encourage semi-Fowler position

5. Monitor for signs of respiratory distress (e.g., labored respirations; cool, clammy skin;

- cyanosis; and change in mental status)
6. Balance rest periods to conserve oxygen with activity to mobilize secretions
  7. Instruct to cover nose and mouth when coughing; dispose of tissues in fluid impervious bag
  8. Administer prescribed antibiotics
  9. Teach preventive measures: role of nutrition and fluids; avoidance of respiratory irritants and people with an active respiratory infection; balance of activity and rest; cessation of smoking; oral hygiene; need for pneumococcal and influenza vaccinations (influenza vaccine recommended for those 50 years or older; pneumococcal vaccine recommended for those 65 years or older)
  10. Follow agency policy regarding transmission-based precautions
  11. Provide nursing care for client with SARS
    - a. Use contact precautions (e.g., gloves, gowns, and eye protection); airborne precautions (N-95 disposable respirators)
    - b. Place in negative-pressure isolation room
    - c. Have client wear surgical mask until infection control precautions can be implemented and during transport in hospital or to home
    - d. Isolate in home for 10 days after resolution of fever and respiratory symptoms
    - e. Teach client and family members transmission-based precautions to be followed in home

## Evaluation/Outcomes

1. Maintains patent airway
2. Maintains adequate oxygen saturation
2. Performs activities of daily living (ADLs) without assistance
3. Abstains from smoking

## Pulmonary Tuberculosis

### Data Base

#### A Etiology and pathophysiology

1. Lung infection caused by *M. tuberculosis*, an acid-fast bacterium, commonly transmitted by inhalation of airborne respiratory droplets
2. Macrophages surround bacilli and form a fibrous tissue mass around a Ghon tubercle; necrosis and calcification of mass within lungs causes bacilli to be dormant; future compromised immune responses can cause the Ghon tubercle to ulcerate and activate bacilli
3. Predisposing factors: substance abuse, diabetes mellitus, antirejection drugs used in organ transplants, HIV infection, cirrhosis, and other debilitating diseases, as well as inadequate nutrition, crowded living conditions, institutions (e.g., prisons, mental health and long-term care facilities), and immigration from countries with high prevalence

4. Emergence of drug-resistant TB has complicated management and treatment
5. Chronic; progressive; reinfection phase involves progression or reactivation of primary lesions after months or years of latency; more common in adults
6. Swallowing infected sputum may lead to laryngeal, oropharyngeal, and intestinal TB; also may involve bone, kidneys, and meninges

#### B Clinical findings

1. Subjective: malaise; pleuritic pain; easy fatigability
2. Objective
  - a. Fever; night sweats; weight loss; cough that progressively becomes worse; hemoptysis
  - b. Chest x-ray film may reveal active or calcified lesions, pleural effusion
  - c. Analysis of sputum and gastric contents demonstrates presence of acid-fast bacilli
  - d. Tuberculin skin test (Mantoux) involves an intradermal injection of purified protein derivative (PPD) from tubercle bacillus extract
    - (1) Determines antibody response to TB bacillus; induration of 10 mm or greater 48 to 72 hours after administration indicates a positive finding; induration of 5 mm may also be significant, particularly for immunocompromised clients
    - (2) Positive finding indicates prior exposure to *M. tuberculosis*; may or may not indicate active disease state (a sudden change from negative to positive requires follow-up); the immunization bacille Calmette-Guérin (BCG), an attenuated vaccine of *Mycobacterium bovis*, may cause a false positive reaction
    - (3) Immunocompromised clients may not have a positive reaction despite being infected with *M. tuberculosis*
  - e. QuantiFERON TB Gold (QFT-G) test detects release of interferon-gamma when blood of a client who has been exposed to TB is incubated with synthetic peptides representing protein present in TB bacillus; results are available in less than 24 hours and more specific than the tuberculin skin test; rarely done because of cost

#### C Therapeutic interventions

1. Multiple antituberculin drugs for 8 weeks in initial treatment phase, followed by 4- to 7-month continuation phase during which two drugs are continued (see [Antituberculars under Related Pharmacology](#))
2. Bed rest until symptoms abate or therapeutic regimen is established
3. Surgical resection of involved lobe if hemorrhage develops or chemotherapy is unsatisfactory; rarely done
4. Isoniazid (INH) preventive therapy (IPT) for 6 to 12 months to immediate contacts; all cases and follow-up of contacts must be reported to public health agency
5. High-carbohydrate, high-protein, high-vitamin diet with supplemental vitamin B<sub>6</sub> to counter INH side effects

### ***Nursing Care of Clients with Pulmonary Tuberculosis***

## Assessment/Analysis

1. Detailed history related to exposure, travel, or BCG inoculation
2. Fatigue, anorexia, low-grade fever, and night sweats
3. Sputum for color, amount, and consistency

## Planning/Implementation

1. Encourage balance in scheduled periods of rest and activity
2. Teach which foods to include in diet and which are nutritious between-meal supplements
3. Help plan a realistic schedule for taking numerous medications
4. Teach importance of continued follow-up and adherence, without variation, to drug regimen that has been established; monitor adherence
5. Instruct to be alert to early symptoms of adverse drug reactions (e.g., optic and peripheral neuritis, eighth cranial nerve damage, nephrotoxicity, hepatitis, dermatitis) and to contact health care provider immediately if any occur
6. Use standard precautions and airborne precautions with high-efficiency particulate air (HEPA) filter; teach techniques to prevent spread of infection to family members and others (e.g., frequent handwashing, covering mouth when coughing, using and disposing of tissues, cleansing eating utensils, and disposing of food wastes (See [Ch 3, Table 3-1: Precautions to Prevent the Spread of Microorganisms](#))
7. Encourage coughing and deep breathing
8. Encourage expression of feelings about disease and the many ramifications (e.g., stigma, isolation, fear) it creates

## Evaluation/Outcomes

1. Performs ADLs without shortness of breath
2. Maintains adequate body weight
3. Adheres to treatment regimen
4. Attains sputum free of *M. tuberculosis*

## Obstructive Airway Diseases

### Data Base

A Etiology and pathophysiology

1. Asthma: reversible bronchospasms, mucosal edema, and increased secretions that last an hour or more; severity classified as mild intermittent, mild persistent, moderate persistent, or severe persistent; status asthmaticus is an asthmatic attack that is difficult to control; asthma is no longer grouped with other diseases that comprise the broad classification of COPD, but it is an obstructive airway disease
2. Chronic obstructive pulmonary disease (COPD): progressive airflow limitation associated with an inflammatory response; four stages classified as mild, moderate, severe, and very severe

- a. Chronic bronchitis: inflammation of bronchial walls with hypertrophy of mucous goblet cells; characterized by a chronic cough
  - b. Emphysema: distended, inelastic, or destroyed alveolar walls that impair diffusion of gases through the alveolar capillary membrane that traps air, making exhalation difficult
3. Traditionally it was believed that clients with COPD become accustomed to an elevated residual carbon dioxide level and did not respond to high carbon dioxide concentrations as the respiratory stimulant; clients responded instead to a drop in oxygen concentration in the blood. Newer theories (e.g., Haldane effect) suggest the adverse effects of administering high concentrations of oxygen are caused by the inability of oxygen-saturated hemoglobin molecules to transport carbon dioxide, leading to increased hypercapnia; this oxygen sensitivity affects a small subset of clients
  4. May precipitate pulmonary hypertension, cor pulmonale, right ventricular heart failure, or pneumothorax

#### B Clinical findings

1. Subjective: anxiety, restlessness, fatigue, weakness, dyspnea, headache, impaired sensorium
2. Objective
  - a. Orthopnea, expiratory wheezing, sonorous breathing, cough
  - b. Decreased forced expiratory volume; increased residual volume
  - c. COPD: barrel chest, cyanosis, clubbing of fingers, use of accessory muscles, pursed lip breathing; increased  $\text{PCO}_2$  and decreased  $\text{PO}_2$ ; polycythemia
  - d. Right ventricular heart failure: distended neck veins, peripheral edema

#### C Therapeutic interventions

1. Medications to reduce airway restriction: bronchodilators, antiasthmatics (see [Related Pharmacology](#) in this chapter)
2. Medications to reduce inflammation: adrenocorticoids (see [Related Pharmacology in Chapter 9](#))
3. Medications to prevent/treat infection: antibiotics, antivirals (see [Related Pharmacology in Chapter 3](#))
4. Medications to liquefy secretions and promote expectoration: mucolytics, expectorants (see [Related Pharmacology](#))
5. Oxygen to maintain at least 90% oxygen saturation
6. Respiratory therapy program: nebulizer therapy, postural drainage, and exercise
7. High-protein soft diet in small, frequent feedings
8. Pneumococcal and influenza vaccines to decrease risk of infection
9. Surgery for end-stage emphysema: lung volume reduction, lung transplant

## ***Nursing Care of Clients with Obstructive Airway Disease***

### **Assessment/Analysis**

1. History of increased symptoms: during early morning, in cold weather, when sleeping, and when smoking
2. Breathing patterns: abdominal, paradoxical, pursed lip, asynchronous; breath sounds; orthopnea
3. Frequency of respiratory tract infections
4. Evidence of chronic and acute hypoxia
5. Nutritional status

## **Planning/Implementation**

1. Monitor vital signs, oxygen saturation, breath sounds, and arterial blood gases
2. Emphasize smoking cessation and avoidance of other external irritants (e.g., dust and allergens)
3. Supervise respiratory exercises, such as pursed-lip or diaphragmatic breathing; orthopneic position aids in exhalation
4. Encourage participation in physical conditioning program
5. Encourage fluids to maintain hydration
6. Teach use of inhalers and other special equipment (e.g., spacer, peak expiratory flow meter)
7. Monitor for signs and symptoms of hypoxia and CO<sub>2</sub> intoxication (CO<sub>2</sub> narcosis) such as restlessness, mental confusion
8. Teach to adjust activities to avoid overexertion and exposure to cold
9. Teach to avoid crowds and people with respiratory tract infections
10. Teach to avoid sedatives or hypnotics, which may compromise respirations
11. Teach to maintain highest resistance possible by attaining adequate rest, eating nutritious food, dressing appropriately for weather conditions, maintaining fluid intake, receiving pneumococcal and influenza vaccinations
12. Teach to identify early symptoms of infection, hypoxia, hypercapnia, or adverse response to medications including glucocorticoids
13. Encourage to continue with health care supervision
14. Encourage to express feelings about disease and therapy
15. Assist to cope with lifelong activity restrictions
16. Teach how to prevent complications of immobility when activity is severely restricted or bed rest becomes necessary
17. Encourage client and family to take an active role in planning therapy

## **Evaluation/Outcomes**

1. Demonstrates pursed-lip breathing and diaphragmatic breathing
2. Adheres to treatment regimen
3. States methods for reducing/controlling feelings of anxiety/fear

## **Pneumothorax/Chest Injury**

## Data Base

### A Etiology and pathophysiology

1. Collapse of a lung resulting from disruption of negative pressure within the intrapleural space caused by presence of atmospheric air in the pleural cavity
2. Surface area for gaseous exchange is reduced, which leads to hypoxia and retention of carbon dioxide (hypercapnia)
3. Types
  - a. Spontaneous or simple: occurs when a weakened area of lung (bleb) ruptures; air moves from lung to intrapleural space, causing collapse; highest incidence is in men 20 to 40 years of age
  - b. Traumatic: disruption of pleural space by invasive chest procedures, laceration (e.g., a stab wound) through chest wall into intrapleural space, or penetration by a fractured rib
  - c. Hemothorax: collection of blood within pleural cavity often accompanies traumatic pneumothorax; blood disrupts negative pressure of pleural space
  - d. Tension: buildup of pressure as air accumulates within pleural space; pressure increases causing lung to collapse; pressure displaces trachea, esophagus, heart, and great vessels toward unaffected side (mediastinal shift), causing increased thoracic pressure, reduced venous return, and decreased cardiac output ([Figure 7-7: Tension pneumothorax](#))

**FIGURE 7-7** Tension pneumothorax. As pleural pressure on the affected side increases, mediastinal displacement ensues, with resultant respiratory and cardiovascular compromise. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.)

4. Flail chest: instability of chest, usually when three or more adjacent ribs are fractured or detached from sternum; caused by blunt trauma (e.g., steering wheel of car)

### B Clinical findings

1. Subjective: sudden unilateral pleuritic chest pain, may be mild discomfort or sharp, that increases on exertion; dyspnea; anxiety; drowsiness
2. Objective

- a. Tachycardia; hypotension; rapid, shallow respirations (asymmetric); diaphoresis; progressive cyanosis
- b. Flail chest: loose chest segment moves inward during inspiration and outward during expiration (paradoxical respiration)
- c. Breath sounds on affected side are diminished or absent
- d. Chest x-ray examination reveals extent of pneumothorax
- e. Increased  $PCO_2$ ; decreased  $PO_2$

#### C Therapeutic interventions

1. Bed rest initially
2. Medications: analgesics, antibiotics
3. Return of negative pressure in intrapleural space by insertion of chest tubes attached to suction
4. Restoration of blood volume loss as a result of trauma

### ***Nursing Care of Clients with Pneumothorax***

#### **Assessment/Analysis**

1. Auscultation of lung fields for diminished or absent breath sounds
2. Chest percussion for hyperresonance and palpation for tracheal deviation toward unaffected side in tension pneumothorax
3. Chest motion during inhalation/exhalation
4. Vital signs, oxygen saturation
5. Skin for changes in color

#### **Planning/Implementation**

1. Maintain constant supervision until stable
2. Maintain patency of chest tubes (see [Chest Tubes under Related Procedures](#))
3. Place in high-Fowler position
4. Manage pain as prescribed
5. Offer fluids frequently
6. Monitor vital signs, particularly respirations; breath sounds; and oxygen saturation

#### **Evaluation/Outcomes**

1. Maintains adequate gas exchange
2. Verifies reduction or absence of chest pain

## **Malignant Lung Tumors**

### ***Data Base***

#### A Etiology and pathophysiology

1. Carcinoma of lungs may be primary or metastatic; leading type of cancer that causes death

2. Incidence highest in men older than 60 years; incidence in women is increasing
3. Risk factor: smoking is most significant; inhalation of carcinogens responsible for 80% to 90% of cases
4. Classification and incidence of lung cancers: adenocarcinoma, 30% to 40%; epidermoid (squamous cell), 30%; small cell (oat cell carcinoma), 20% to 25%; large cell (undifferentiated), 10% to 15%
5. Symptoms may first occur after metastasis to other organs such as lymph nodes, bone, liver, adrenal glands, mediastinal organs, kidneys, and brain
6. Staging based on tumor size, node involvement, and presence of metastasis

#### B Clinical findings

1. Subjective: dyspnea; chills; fatigue; chest pain
2. Objective
  - a. Persistent cough; change in voice quality; hemoptysis; unilateral wheeze; weight loss; clubbing of fingers
  - b. Chest x-ray film reveals pleural effusion and “coin” lesions; CT scans and magnetic resonance imaging (MRI) detect metastasis; bronchial washings and brushings from bronchoscopy, CT-guided needle biopsy, and cytologic test of sputum positive for cancer cells

#### C Therapeutic interventions

1. Surgical
  - a. Lobectomy: removal of one lobe when lesion is limited to one lobe
  - b. Wedge resection: removal of a segment when lesion is limited to one segment; may also be done for biopsy
  - c. Pneumonectomy: removal of an entire lung
  - d. Thoracentesis for pleural effusion (see [Thoracentesis under Related Procedures](#))
2. Radiation therapy may be an adjunct therapy to alleviate symptoms of pain, dyspnea, and hemoptysis
3. Chemotherapy (see Neoplastic Disorders, Related Pharmacology in [Chapter 3](#))

## ***Nursing Care of Clients with Malignant Lung Tumors***

### **Assessment/Analysis**

1. Sputum quantity and characteristics
2. Lung auscultation for breath sounds
3. Chest percussion for dullness over tumors
4. Respirations for shallowness, stridor, and use of accessory muscles
5. Persistent cough

### **Planning/Implementation**

1. Monitor vital signs, breath sounds, oxygen saturation
2. Encourage coughing and deep breathing
3. Change position frequently; semi-Fowler or high-Fowler promotes greater lung

expansion

4. Encourage high-protein, high-calorie diet and supplements
5. Manage pain: analgesics, distraction, relaxation, imagery
6. After pneumonectomy: position on operative side to promote expansion of remaining lung; monitor for signs of mediastinal shift (e.g., displacement of trachea toward operative side)
7. Provide specific care based on therapy: care of client with chest tubes (see [Chest Tubes under Related Procedures](#)), radiation therapy and chemotherapy (see Neoplastic Disorders, General Nursing Care of Clients with Neoplastic Disorders in [Chapter 3](#))

## Evaluation/Outcomes

1. Verbalizes reduction of pain
2. Maintains adequate oxygen saturation
3. Breathes with minimal effort

## Cancer of the Larynx

### Data Base

A Etiology and pathophysiology

1. Carcinoma of the larynx (vocal cords, epiglottis, and laryngeal cartilages); most are squamous cell carcinoma
2. Risk factors: cigarette smoking, secondhand smoke, air pollution, asbestos, chronic respiratory tract infections, heavy alcohol consumption, and voice strain
3. Incidence higher in men 50 to 70 years of age

B Clinical findings

1. Subjective: sore throat; dyspnea; dysphagia; weakness
2. Objective: increasing hoarseness; weight loss; enlarged cervical lymph nodes; foul breath; dysphagia

C Therapeutic interventions

1. Radiation therapy
2. Chemotherapy: not curative; preoperatively—decreases tumor size; postoperatively—decreases metastasis
3. Surgical intervention
  - a. Partial laryngectomy: one vocal cord and part of larynx removed with tumor; performed in early stages
  - b. Total laryngectomy: removal of total larynx with construction of a permanent tracheal stoma
  - c. Radical neck dissection: removal of larynx, surrounding tissue and muscle, lymph nodes, and glands with a permanent tracheal stoma; performed when tumor has metastasized into surrounding tissue and lymph nodes; chest tubes may be needed if thoracic duct leakage occurs; total parenteral nutrition (TPN) may be needed for nutritional support

- d. Laser: eradicates small tumors or vocal cord tumors; used in conjunction with chemotherapy

## ***Nursing Care of Clients with Cancer of the Larynx/Laryngectomy***

### **Assessment/Analysis**

1. Voice for hoarseness
2. Oropharyngeal inspection for masses
3. Neck palpation for masses and nodal enlargement

### **Planning/Implementation**

1. Provide time to discuss diagnosis and ramifications of surgery
2. Encourage client to express feelings; involve client and family in preoperative planning
3. Establish methods of communication that will be used after surgery (e.g., slate board and chalk, pencil and paper, sign language, electronic voice, computer)
4. Observe for obstruction of airway by mucus plugs, edema, or blood (e.g., air hunger, dyspnea, cyanosis, gurgling); keep head elevated
5. Observe for signs of hemorrhage (e.g., increased pulse rate, drop in blood pressure, cold clammy skin, blood on dressing, frequent swallowing)
6. Encourage fluids and use of a humidifier to keep secretions loose
7. Provide specific nursing care for a client with a laryngectomy
  - a. Have suction apparatus and additional laryngectomy tube and surgical instrument set with additional hemostats immediately available in case tube becomes dislodged or blocked
  - b. Suction laryngectomy tube as necessary (see [Suctioning of Airway under Related Procedures](#))
  - c. Expect and accept a period of mourning, but prevent withdrawal from reality by involving in laryngectomy care, keeping channels of communication open, supporting strengths, encouraging return to ADLs
  - d. Provide hydration and humidity to compensate for loss of humidification of air in nasopharynx
  - e. Teach skills necessary to manage altered body functioning: tracheobronchial suctioning; changing, cleaning, and securing laryngectomy tube; caring for skin around stoma; providing humidified air for inspiration to prevent drying of secretions, which can be achieved with a moist dressing or cloth bib
  - f. Arrange for individuals with laryngectomies to visit the client and discuss the rehabilitative process
  - g. Encourage to become involved in speech therapy (e.g., esophageal, electric larynx, tracheoesophageal fistula)
  - h. Teach to avoid activities that may permit water or irritating substances to enter trachea: showers unless wearing a protective cover, swimming, dust, high winds, hair spray, and other volatile substances

- i. Teach to avoid wearing clothes with constricting collars or necklines
- j. Teach that certain activities will be impossible (e.g., sipping through a straw, whistling, blowing nose)

## Evaluation/Outcomes

1. Maintains patent airway
2. Communicates effectively
3. States acceptance of body image

## Acute Respiratory Distress Syndrome (ARDS)

### Data Base

#### A Etiology and pathophysiology

1. Acute lung injury precipitated by trauma, aspiration, prolonged mechanical ventilation, severe infection, prolonged cardiopulmonary bypass, fat or air emboli, shock, smoke inhalation, coagulopathy
2. Involves
  - a. Alveolar capillary damage with loss of fluid and pulmonary edema
  - b. Impaired alveolar gas exchange causing V/Q mismatch and shunting; tissue hypoxia results
  - c. Alteration in surfactant production; decreased lung compliance
  - d. Atelectasis, resulting in labored and inefficient respiration

#### B Clinical findings

1. Subjective: restlessness; anxiety; dyspnea
2. Objective
  - a. Tachycardia; grunting respirations; intercostal retractions; cyanosis
  - b.  $\text{PCO}_2$  initially decreased and later increased; decreased  $\text{PO}_2$ ; chest x-ray study shows pulmonary edema

#### C Therapeutic interventions

1. Treatment of underlying cause
2. Supplemental oxygen
3. Mechanical ventilation with positive end-expiratory pressure (PEEP): PEEP maintains positive pressure within lungs at end of expiration; increases residual capacity, reducing hypoxia; sedative or neuromuscular blocking agents may be needed to facilitate mechanical ventilation
4. Surfactant replacement therapy may be necessary
5. Maintenance of fluid volume and nutrition

## Nursing Care of Clients with Acute Respiratory Distress Syndrome

### Assessment/Analysis

1. Vital signs, especially characteristics of respirations

2. Breath sounds, oxygen saturation, ECG
3. Pain that increases on inspiration

## Planning/Implementation

1. Maintain a patent airway
2. Monitor oxygen saturation and arterial blood gases per protocol
3. Observe behavioral changes and obtain vital signs because confusion and hypertension may indicate cerebral hypoxia
4. Change position frequently; prone position has demonstrated increased oxygenation thought to be due in part to changes in gravitational forces that redistribute perfusion (e.g., lack of compression of beating heart, modified hydrostatic pressures redistribute intrapulmonary gases)
5. Schedule frequent rest periods between therapeutic interventions
6. Establish system for communication when intubated
7. Provide tranquil, supportive environment; sedation is contraindicated because of its depressant effect on respirations unless receiving mechanical ventilation
8. Provide care for client receiving mechanical ventilation (see [Mechanical Ventilation under Related Procedures](#))
9. Auscultate lungs for absent breath sounds that indicates pneumothorax (when on PEEP frail lung tissue may not withstand increased intrathoracic pressure and a pneumothorax results)

## Evaluation/Outcomes

1. Maintains adequate gas exchange
2. Communicates reduction in anxiety
3. Performs activities without respiratory distress or fatigue

## Carbon Monoxide Poisoning

### **Data Base**

#### A Etiology and pathophysiology

1. Carbon monoxide combines with hemoglobin more readily than does oxygen, resulting in tissue anoxia
2. Caused by inadequately vented combustion devices

#### B Clinical findings

1. Subjective: headache; dizziness; confusion; palpitations; weakness
2. Objective
  - a. Skin color usually is cherry pink but may be normal, cyanotic, or flushed; paralysis; loss of consciousness
  - b. ECG changes; elevated carboxyhemoglobin levels (expected level less than 3%; 50% to 70% results in death)

#### C Therapeutic interventions

1. Mechanical ventilation with 100% oxygen until carboxyhemoglobin is reduced to less than 5% and respirations are within expected limits
2. Hyperbaric pressure chamber to increase oxygen concentration and accelerate formation of carbon dioxide, which can be exhaled

## ***Nursing Care of Clients with Carbon Monoxide Poisoning***

### **Assessment/Analysis**

1. History to determine extent of exposure
2. Color of skin
3. Level of consciousness

### **Planning/Implementation**

1. Remove from immediate area of poisoning
2. Maintain respirations; institute cardiopulmonary resuscitation if necessary and continue until help arrives
3. Monitor vital signs, with special concern for respirations and breath sounds
4. Monitor cardiopulmonary and neurologic function
5. Administer oxygen as prescribed
6. Monitor carboxyhemoglobin levels
7. Provide care for client receiving mechanical ventilation (see [Mechanical Ventilation under Related Procedures](#))
8. Determine whether accidental or intentional; obtain a psychiatric referral if cause was intentional

### **Evaluation/Outcomes**

1. Maintains adequate oxygen levels
2. Remains conscious and alert

# CHAPTER 8

# Nursing Care of Clients with Gastrointestinal System Disorders

---

# Overview

## Review of Anatomy and Physiology

### *Functions of the Gastrointestinal System*

#### Digestion

A Changes to food in alimentary canal occur so it can be absorbed and metabolized

B Types

1. Mechanical digestion: movements of alimentary tract that
  - a. Change physical state of foods
  - b. Propel food along alimentary tract
    - (1) Deglutition: swallowing
    - (2) Peristalsis: wavelike movements that squeeze food downward in the tract
    - (3) Sequential contractions: movements that mix gastric and intestinal contents with digestive juices
2. Chemical digestion: series of hydrolytic processes dependent on specific enzymes and chemicals; an additional substance may be necessary to act as a catalyst to facilitate the process

#### Absorption

A Passage of small molecules from food sources through intestinal mucosa into blood or lymph

B Accomplished mainly through movement of molecules against a concentration gradient because of energy (adenosine triphosphate [ATP]) expenditure (active transport) by intestinal cells; makes it possible for water and solutes to move through intestinal mucosa in a direction opposite that expected with osmosis and diffusion

C Majority occurs in small intestine; most water is absorbed from large intestine

#### Metabolism

A Definition: sum of all chemical reactions engaged in energy production and expenditure

B Anabolism: synthesis of various compounds from simpler compounds

C Catabolism: metabolic process in which complex substances are broken down into simple compounds; energy is liberated for use in movement, energy storage, and heat production

D Metabolism of carbohydrates

1. Glucose transport through cell membranes and phosphorylation
  - a. Insulin promotes transport of glucose and amino acids through cell membranes
  - b. Glucose phosphorylation: conversion of glucose to glucose 6-phosphate; insulin increases activity of glucokinase and promotes glucose phosphorylation, which is essential before glycogenesis and glucose catabolism

2. Glycogenesis: conversion of glucose to glycogen for storage in liver and muscle cells
3. Glycogenolysis
  - a. Glycogen is catabolized to glucose 6-phosphate in muscle cells
  - b. Glycogen is converted to glucose in muscle cells; glucagon and epinephrine accelerate liver glycogenolysis
4. Glucose catabolism
  - a. Glycolysis: breakdown of one glucose molecule into two pyruvic acid molecules, with conversion of about 5% of energy stored in glucose to heat and ATP molecules
  - b. Krebs citric acid cycle with the electron transport chain: breakdown of two pyruvic acid molecules into six carbon dioxide and six water molecules; Krebs cycle releases about 95% of energy stored in glucose
5. Gluconeogenesis: chemical reaction that converts protein or fat compounds into glucose; occurs in liver cells
6. Principles of carbohydrate metabolism
  - a. Preferred energy fuel: most cells catabolize glucose first, sparing fats and proteins; when glucose supply becomes inadequate, most cells catabolize fats next; nerve cells require glucose, thus causing proteins to be sacrificed to provide amino acids needed to produce more glucose (gluconeogenesis); small amounts of glucose can be produced from glycerol portion of fats
  - b. Glycogenesis: glucose in excess of 120 to 140 mg per 100 mL of blood brought to liver cells undergoes glycogenesis and is stored as glycogen
  - c. Glycogenolysis: when blood glucose concentration decreases below midpoint of expected level, liver glycogenolysis accelerates and tends to raise blood glucose concentration back toward midpoint of expected level
  - d. Gluconeogenesis: when blood glucose concentration decreases below expected level or when amount of glucose entering cells is inadequate, liver gluconeogenesis accelerates and raises blood glucose levels
  - e. Glucose storage as fat: when blood insulin content is adequate, glucose in excess of amount used for catabolism and glycogenesis is converted to fat

## ***Structures of the Gastrointestinal System***

(Figure 8-1: Structures of the digestive system)

**FIGURE 8-1** Structures of the digestive system. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

## Mouth (Buccal Cavity)

A Lips and cheeks

B Hard palate; soft palate

C Gums (gingivae); teeth

D Tongue

1. Papillae: rough elevations on surface

2. Taste buds: receptors of cranial nerves VII (facial) and IX (glossopharyngeal); located in papillae

E Tonsils: lymphatic tissue that produces lymphocytes; defense against infection

F Salivary glands

1. Parotid, submandibular, and sublingual

2. Produce saliva, mixture of water, mucin, salts, and enzyme salivary amylase (ptyalin)

## Esophagus

A Posterior to trachea; anterior to vertebral column

B Extends from pharynx through an opening in diaphragm (hiatus) to stomach

C Collapsible muscular tube; about 25 cm (10 inches) long

D Secretes mucus; facilitates movement of food

## Stomach

A Size varies in people and according to degree of distention

B Elongated pouch, with greater curve forming lower left border

C In epigastric and left hypochondriac portions of abdominal cavity

D Divisions

1. Fundus: uppermost portion; bulge adjacent to and extending above esophageal opening
2. Body: central portion
3. Pylorus: constricted lower portion

E Sphincters

1. Cardiac: opening of esophagus into stomach
2. Pyloric: opening of pylorus into duodenum

F Secretes gastric juice

1. Stomach wall cells secrete gastrin that stimulates flow of gastric juices
2. Chief cells secrete pepsin
3. Parietal cells secrete hydrochloric acid and intrinsic factor
4. Goblet cells secrete mucin

G Functions: food storage and liquefaction (chyme)

## Small Intestine

A Size: approximately 2.5 cm (1 inch) in diameter; 6.1 m (29 feet) in length when relaxed

B Divisions

1. Duodenum: joins pylorus of stomach; C-shaped
2. Jejunum: middle section
3. Ileum: lower section; no clear boundary between jejunum and ileum

C Functions: digestion and absorption; enzymes include sucrase, lactase, and maltase; cholecystokinin stimulates release of bile from gallbladder

D Processes: mixing movements; peristalsis; secretion of water, ions, and mucus; receives secretions from the liver, gallbladder, and pancreas

## Large Intestine

A Size: approximately 6.3 cm (2.5 inches) in diameter; 1.5 m (5 to 6 feet) long when relaxed

B Divisions

1. Cecum: first 2 to 3 inches
2. Colon: consists of ascending, transverse, descending, and sigmoid colon
3. Rectum: last 7 to 8 inches
4. Anus: terminal opening of alimentary canal

C Functions: water and sodium ion absorption; temporary storage of fecal matter; defecation

D Processes: weak mixing movements, peristalsis, and mass movements

## Vermiform Appendix

A Blind-end tube of cecum just beyond ileocecal valve

B Function: part of immune system

## Liver

A Occupies most of right hypochondrium and part of epigastrium

B Divided into thousands of lobules

C Ducts

1. Hepatic duct: from liver
2. Cystic duct: from gallbladder
3. Common bile duct: formed by union of hepatic and cystic ducts; drains bile into duodenum at sphincter of Oddi

D Functions

1. Carbohydrate metabolism: converts glucose to glycogen by glycogenesis, converts glycogen to glucose by glycogenolysis, and forms glucose from proteins and fats by gluconeogenesis
2. Fat metabolism
  - a. Ketogenesis: fatty acids are broken down into molecules of acetyl coenzyme A (acetyl-CoA) (beta oxygenation), which form ketone bodies (acetoacetic acid, acetone, beta-hydroxybutyric acid)
  - b. Fat storage
  - c. Synthesis of triglycerides, phospholipids, cholesterol, and B complex factor choline
3. Protein metabolism
  - a. Anabolism: synthesis of various blood proteins (e.g., prothrombin, fibrinogen, albumins, alpha and beta globulins, and clotting factors V, VII, IX, and X)
  - b. Deamination: chemical reaction by which amino group splits off from amino acid to form ammonia and a keto acid
  - c. Urea formation: liver converts most of ammonia formed by deamination to urea
4. Secretes bile, substance important for emulsifying fats before digestion and as a vehicle for excretion of cholesterol and bile pigments
5. Detoxifies various substances (e.g., drugs, hormones)
6. Vitamin metabolism: stores vitamins A, D, K, and B<sub>12</sub>; bile salts needed to absorb fat-soluble vitamins A, D, E, and K
7. Chief source is synthesized by bacteria in large intestine; vitamin K is a fat soluble vitamin that requires bile for its absorption

## Gallbladder

A Lies on undersurface of liver

B Sac made of smooth muscle, lined with mucosa arranged in rugae

C Functions: concentrates and stores bile

## Pancreas

A Structure

1. Fish-shaped, with body, head, and tail; extends from duodenal curve to spleen

## 2. Duct and ductless gland

- a. Pancreatic cells: secrete pancreatic juice via duct to duodenum; enzymes include trypsin, lipase, and amylase; stimulated by duodenal hormones secretin and pancreozymin and by parasympathetic impulses
- b. Islets of Langerhans: clusters of cells not connected with pancreatic ducts; composed of alpha and beta cells

## B Functions

1. Pancreatic juice composed of enzymes that help digest carbohydrates, proteins, and fats
2. Islet cells constitute endocrine gland
  - a. Alpha cells secrete the hormone glucagon, which accelerates liver glycogenolysis and initiates gluconeogenesis; tends to increase blood glucose level
  - b. Beta cells secrete insulin, which exerts profound influence on metabolism of carbohydrates, proteins, and fats
    - (1) Accelerates active transport of glucose, along with potassium and phosphate ions, through cell membranes; decreases blood glucose level and increases glucose utilization by cells for either catabolism or anabolism
    - (2) Stimulates production of liver cell glucokinase; promotes liver glycogenesis, which lowers blood glucose concentration
    - (3) Inhibits liver cell phosphatase and therefore inhibits liver glycogenolysis
    - (4) Accelerates rate of amino acid transfer into cells, promoting anabolism of proteins within cells
    - (5) Accelerates rate of fatty acid transfer into cells, promotes fat anabolism (lipogenesis); inhibits fat catabolism

# Review of Nutrients

## Sources of Energy

A Carbohydrates (4 calories per 1 g): sugars (simple) and starches (complex); help provide basic fuel for energy (see Metabolism of Carbohydrates under Functions of the Gastrointestinal System); *food sources*: sugars, honey, fruit, milk, syrups, potatoes, rice, legumes, and products made with flour from grain (e.g., bread, cereal, pasta, crackers, cake, and cookies)

B Proteins (4 calories per g): basically composed of amino acids; necessary for body growth, development, and healthy functioning; maintains nitrogen balance; *food sources*: meat, fish, poultry, dry beans, eggs, nuts, milk, and cheese

C Fats (9 calories per 1 g): include neutral fats, oils, fatty acids, cholesterol, and phospholipids; contribute to cellular transport; dietary source of fuel and fuel reserve; vitamin absorption and transport; insulation and protection afforded by adipose tissue; *food sources*: animal fat, coconut and palm oil, dairy products, whole milk, vegetable oils, butter, margarine, mayonnaise, salad dressings, and baked goods and snacks that contain significant fat

# Vitamins

A Organic compounds needed to catalyze metabolic processes; essential for growth, development, and maintenance of body processes

## B Types

1. Vitamin A: fat-soluble vitamin needed for night vision, healthy epithelium, skeletal and tooth development, and energy regulation
  - a. Sources: carrots, cantaloupe, sweet potatoes, apricots, squash, broccoli, cabbage, spinach and collards, fortified milk products, egg yolk, liver, and kidney
  - b. Deficiency: slow accommodation to dim light, sinus problems, sore throat, epithelial thickening of tissue over the eye
  - c. Excess: yellow discoloration of skin (carotenemia)
2. Vitamin D: fat-soluble vitamin that enhances bone mineralization promoting absorption of calcium, muscle contraction
  - a. Sources: sunlight, cod liver oil, fortified milk, most dairy products
  - b. Deficiency: rickets (soft, fragile bones; skeletal deformities), osteomalacia (softening of bone, causing flexible, brittle bones; skeletal deformities), tetany resulting from low serum calcium level (vitamin D necessary for calcium absorption)
3. Vitamin E: fat-soluble vitamin that is an antioxidant
  - a. Sources: vegetable and peanut oils, whole grains, wheat germ, milk, eggs, meats, fish, and leafy vegetables
  - b. Deficiency: muscle weakness, anemia; rarely occurs
4. Vitamin K: fat-soluble vitamin associated with blood clotting and bone metabolism; majority is produced by intestinal bacteria
  - a. Sources: liver; green, leafy vegetables (e.g., lettuce, spinach, cabbage, kale, broccoli, Brussels sprouts), cauliflower, asparagus
  - b. Deficiency: prolonged antibiotic therapy and fat absorption problems, which contribute to prolonged blood clotting time
5. Vitamin C: water-soluble vitamin; antioxidant; associated with wound and fracture healing, adrenal gland function, iron absorption, and folic acid conversion
  - a. Sources: citrus fruits, tomatoes, green and red peppers, white potatoes, cabbage, broccoli, kale, asparagus, chard, turnip greens, berries, melons, pineapple, and guavas
  - b. Deficiency (scurvy): tender, sore, bleeding gums; loose teeth; small skin hemorrhages and bleeding around joints, stomach, and heart; ends of long bones soften; delayed wound healing
6. B-complex vitamins: B<sub>1</sub> (thiamine), B<sub>2</sub> (riboflavin), B<sub>3</sub> (niacin), B<sub>6</sub> (pyridoxine), folic acid, B<sub>12</sub> (cyanocobalamin), B<sub>5</sub> (pantothenic acid), and biotin; function as coenzymes
  - a. Sources: enriched grains; each has its own source (e.g., B<sub>1</sub>—pork, wheat germ; B<sub>2</sub>—milk; B<sub>3</sub>—legumes; B<sub>6</sub>—organ meats; folic acid—orange juice, green leafy vegetables; biotin—egg yolks, liver)
  - b. Deficiency: each has its own clinical findings; often seen in clients who drink an

excessive amount of alcohol, experience weight loss, consume excessive sugar; may turn urine bright yellow

## **Minerals**

A Inorganic substances that regulate body functions; help build body tissues; most important minerals: calcium, sodium, potassium, iron, iodine, and fluorine (see [Table 3-4: Fluid/Electrolyte Imbalances: Etiology, Assessments, and Treatments](#))

B Types

### 1. Calcium

- a. Needed for bone and tooth growth, coagulation, nerve conduction, and muscle contraction
- b. Sources: milk and dairy products, leafy green vegetables, whole grains, nuts, legumes, and seafood

### 2. Sodium

- a. Major role in fluid balance, transmission of electrochemical impulses along nerve and muscle membrane
- b. Sources: table salt, processed foods, milk and milk products (for additional foods, see [Low Sodium Diet under Review of Diets](#))

### 3. Potassium

- a. Regulates fluid balance, conduction of nerve impulses, and muscle contraction, especially the heart
- b. Sources: oranges, bananas, dried apricots or peaches, cantaloupe, prune juice, baked potato with skins, sweet potato, raisins, pinto beans, winter squash, lima beans, broccoli

### 4. Iron

- a. Essential to hemoglobin and myoglobin formation, constituent of enzyme systems
- b. Sources: liver, lean meat, eggs, spinach, fortified cereals, dried beans

### 5. Iodine

- a. Component of thyroid hormones, which help regulate metabolism, cell function and growth
- b. Sources: saltwater fish, shellfish and seaweed, table salt fortified with iodine

### 6. Fluoride (ionized form of fluorine)

- a. Maintains bone structure and strengthens tooth enamel
- b. Sources: added to water, toothpaste, mouthwashes, and provided with supplements

## **Review of Diets**

A MyPlate dietary guidelines: recommended by the U.S. Department of Agriculture, Center for Nutrition Policy and Promotion ([Figure 8-2: MyPlate](#)); includes food groups appropriate for a healthy diet

**FIGURE 8-2** MyPlate advocates building a healthy plate by making half of your plate fruits and vegetables and the other half grains and protein. Avoiding oversized portions, making half your grains whole grains, and drinking fat-free or low-fat (1%) milk are additional recommendations for a healthy diet. (From U.S. Department of Agriculture, Center for Nutrition Policy and Promotion; available at [www.choosemyplate.gov](http://www.choosemyplate.gov).)

#### B Clear liquid diet

1. Minimizes stimulation of gastrointestinal (GI) tract; for clients with nausea and vomiting
2. Permitted: clear broth, bouillon, clear juices, plain gelatin, fruit-flavored water, ices, ginger ale, black coffee, tea

#### C Full liquid diet

1. For client with GI disturbance or inability to tolerate solid or semisolid food; may follow clear liquid diet postoperatively
2. Permitted: all foods on clear liquid diet plus milk and items made with milk, such as cream soups, milk drinks, sherbet, ice cream, puddings, custard, yogurt

#### D Soft diet

1. For clients who have difficulty chewing or swallowing
2. Permitted: all foods on clear and full liquid diets plus soft, refined cereals, pasta, rice, white bread and crackers, eggs, cheese, shredded or chopped meat, potatoes, cooked vegetables, soft cake, bread pudding, cooked fruits, and a few soft, ripe, plain fruits without membranes or skins

E Regular diet: full, well-balanced diet of all foods as desired and tolerated; generally 2000 calories or as ordered by health care provider

#### F Low-residue diet

1. Minimizes fecal volume and residue; used for severe diarrhea, partial bowel obstruction, and during acute episode of inflammation of bowel; can be used in progression to regular diet
2. Excluded: milk and milk products, food with seeds, nuts, grains, and raw or dried

vegetables and fruits

#### G High-fiber diet

1. Foods high in fiber resist digestion, causing bulky stool that increases peristalsis; increases water content of stool
2. Sources: whole grain foods, bran, root vegetables and their skins, prunes, nuts, fruits, beans

#### H Restrictive diets: individually designed to meet specific needs of client

1. Low-sodium diet (e.g., 2 g sodium)
    - a. Limits sodium/salt intake
    - b. Permitted: fresh fish, meat and poultry, fresh or frozen vegetables, pasta, unsalted butter, cooking oil, coffee, tea, lemonade, unflavored gelatin, jam, jelly, honey and maple syrup, unsalted nuts and popcorn, unsalted canned foods
    - c. Excluded: salt, monosodium glutamate, soy sauce, milk, cheese, processed luncheon meats and bacon, snack foods (e.g., chips, pretzels, etc.), baked goods containing salt, bouillon, canned or packaged soup, rice/noodles, pickles, olives, sauerkraut, tomato juice, mustard, most bottled and canned drinks, canned vegetables unless low-sodium type, salad dressings, smoked or salted meat or fish, corned beef, powdered milk drinks, buttermilk, highly processed convenience foods, meat extracts, meat tenderizers, sugar substitutes containing sodium, and sauces such as catsup, tartar, horseradish, Worcestershire, and teriyaki
  2. Low-fat diet
    - a. To reduce saturated fat, reduce cholesterol, and prevent coronary heart disease
    - b. Excluded: candy, ice cream, cake, cookies, and fried foods
    - c. Strategies to reduce dietary fat: grill, bake, broil, or microwave food; eat less meat; eat leaner cuts of meat; remove fat from meat and skin/fat from poultry before cooking; use skim milk; use less butter or margarine; eat more fish, lima beans, and navy beans for protein
  3. Calorie restriction: calories are restricted to reduce weight
  4. Renal diet: low sodium, potassium, protein, and possibly fluid restriction; specific restrictions indicated by health care provider
  5. Nonallergic diet: food causing the allergic response is eliminated from diet
  6. Diabetic diet: recommended by the American Diabetic Association to control weight and nutritional intake; balances proteins, carbohydrates, and fats
- I Consistency modifications (e.g., mechanical soft): foods may be cut up, chopped, or pureed to make them easier for client to ingest

## Review of Physical Principles

### *Law of Motion*

Greater the force of contraction of intestinal wall and more frequent the contractions, the more rapid the propulsion of food and fecal matter through the digestive tract

### *Light*

A Refraction: total internal reflection in fiberoptics permits viewing of interior walls of stomach (gastroscopy) and intestines (colonoscopy)

B X-rays: GI series and barium enemas allow visualization of soft tissues of upper and lower GI tract; barium salts coat inner walls of tract and absorb x-rays, outlining organ surfaces

## Review of Chemical Principles

### ***Oxidation and Reduction***

A Uniting oxygen with a substance results in oxidation

B Uniting hydrogen with a substance results in reduction

C Oxidation of nutrients such as glucose results in formation of high-energy ATP molecules and heat

D Some forms of life (anaerobes) can use substances other than oxygen for cellular oxidation (e.g., *Clostridium perfringens* found in gangrenous tissue)

### ***Types of Compounds***

#### **Organic Acids**

A Lactic acid: end product of anaerobic muscle metabolism

B Citric acid: one intermediate in Krebs citric acid cycle

#### **Amino Acids**

A Able to act as acid and base (amphoteric character)

B Essential amino acids cannot be synthesized well enough in body to maintain health and growth and must be supplied in food

#### **Carbohydrates**

A Include simple sugars, starches, celluloses, gums, and resins; contain carbon, hydrogen, and oxygen

B Classification

1. Monosaccharide: a simple sugar (e.g., glucose, fructose)
2. Disaccharide (e.g., sucrose, lactose, maltose)
3. Polysaccharide (e.g., starch, glycogen)

#### **Lipids**

A Fatty acids are important constituents of all lipids except sterols

1. Usually straight-chain carboxylic acids; three fatty acids and one glycerol molecule form a triglyceride
2. Saturated fatty acids: solid at room temperature; mainly animal fats
3. Unsaturated fatty acids: liquid at room temperature
4. Essential fatty acids: cannot be synthesized by body; must be taken in by diet

**B Cholesterol:** sterol found in human and animal tissue; important component of cellular membranes; found in blood at 150 to 200 mg/mL; high cholesterol associated with increased intake of saturated fats and arterial atherosclerosis

## Proteins

### A Simple proteins

1. **Albumins:** necessary for plasma colloid osmotic pressure (oncotic pressure), which helps control (through osmosis) flow of water between plasma and interstitial fluid; with starvation, decreased serum albumin level causes a decrease in plasma colloid osmotic pressure; results in edema as less fluid is drawn by osmosis into capillaries from interstitial spaces
2. **Globulins:** necessary to form antibodies (e.g., serum gamma globulin)

### B Compound proteins

1. **Lipoproteins:** simple proteins combined with lipid substances
  - a. **Low-density lipoprotein cholesterol (LDL)**
    - (1) Chief carriers of cholesterol; low in triglycerides
    - (2) Contribute to atherosclerotic plaque formation
  - b. **High-density lipoprotein cholesterol (HDL)**
    - (1) Consist of 50% protein and 20% cholesterol
    - (2) Inversely associated with coronary heart disease
2. **Nucleoproteins:** proteins complexed with nucleic acids; chromosomes are sometimes referred to as nucleoprotein structures
  - a. Ribonucleic acid (RNA) and deoxyribonucleic acid (DNA) are nucleic acids
  - b. RNA and DNA store and transmit genetic information from one generation to another
3. **Metalloproteins:** proteins containing metal ions (e.g., ferritin, the iron-transporting compound of plasma)

## Review of Microorganisms

### A Bacterial pathogens

1. *Escherichia coli*: small, gram-negative bacilli; part of normal flora of large intestine; certain strains cause urinary tract infections and diarrhea
2. *Clostridium difficile*: anaerobic, spore-forming bacterial pathogen; produces toxins that affect bowel mucosa; major cause of agency acquired diarrhea
3. *Salmonella*: genus of gram-negative, rod-shaped bacteria; origin: raw foods of animal origin (e.g., poultry, eggs, dairy products, beef); also vegetables and fruit when irrigated or washed with contaminated water or packed with contaminated ice for transport
4. *Shigella*: gram-negative bacilli, similar to *Salmonella*; *Shigella dysenteriae* causes bacillary dysentery or shigellosis

### B Protozoal pathogens

1. *Balantidium coli*: ciliated protozoan; causes enteritis

2. *Entamoeba histolytica*: an amoeba; causes amebiasis (amoebic dysentery)

3. *Giardia lamblia*: flagellated protozoan; causes enteritis

### C Parasitic pathogens

1. Nematodes (roundworms): include *Necator americanus* (hookworm), *Ascaris lumbricoides*, *Enterobius vermicularis* (pinworm), *Trichuris trichiura* (whipworm), all may be found in intestine

2. Cestodes (tapeworm): may be found in adult form in intestine; larval stage (hydatid) of some forms may develop and form cysts in liver, lungs, and kidneys

3. Trematodes (flukes): may be found in lungs, liver, and abdominal cavity

## Related Pharmacology

### **Antiemetics**

#### A Description

1. Diminish sensitivity of chemoreceptor trigger zone (CTZ) to irritants or decrease labyrinthine excitability

2. Alleviate nausea and vomiting

3. Prevent and control emesis and motion sickness

4. Available in oral, parenteral (intramuscular [IM], IV), rectal, and transdermal preparations

#### B Examples

1. Centrally acting agents: ondansetron (Zofran); prochlorperazine (Compazine)

2. Agents for motion sickness control: dimenhydrinate (Dramamine); meclizine (Antivert, Bonine); promethazine (Phenergan)

3. Agents that promote gastric emptying: metoclopramide (Reglan)

C Major side effects: drowsiness (central nervous system [CNS] depression); hypotension (vasodilation via central mechanism); dry mouth (decreased salivation from anticholinergic effect); blurred vision (pupillary dilation from anticholinergic effect); incoordination (extrapyramidal symptom resulting from dopamine antagonism)

#### D Nursing care

1. Observe incidences and characteristics of vomitus, provide oral hygiene

2. Eliminate noxious substances from diet and environment

3. Administer before chemotherapy to limit nausea and vomiting

4. Offer sugar-free chewing gum or hard candy to promote salivation

5. Offer soothing fluids or ice chips in small amounts

6. Instruct to change positions slowly

7. Caution to avoid engaging in hazardous activities

### **Anorexiant**

#### A Description

1. Suppress desire for food at hypothalamic appetite centers; generally produce CNS stimulation

2. Available in oral preparations

B Examples: amphetamine sulfate; dextroamphetamine sulfate (Dexedrine); phentermine (Adipex); diethylpropion (Tenuate); phendimetrazine

C Major side effects: nausea, vomiting (irritation of gastric mucosa); constipation (delayed passage of stool in GI tract); tachycardia (sympathetic stimulation); CNS stimulation (sympathetic activation)

D Nursing care

1. Educate regarding

- a. Drug misuse (controlled substances)
- b. Concurrent exercise and diet therapy
- c. Need for medical supervision during therapy
- d. Possibility of affecting ability to engage in hazardous activities

2. Monitor weight

## **Antacids**

A Description

1. Provide protective coating on stomach lining and lower gastric acid pH; allow more rapid movement of stomach contents into duodenum

2. Neutralize gastric acid; effective in treatment of ulcers

3. Available in oral preparations

B Examples: aluminum hydroxide gel (Amphojel); aluminum and magnesium hydroxides (Maalox); famotidine (Pepcid); famotidine plus calcium carbonate and magnesium hydroxide (Pepcid Complete); ranitidine (Zantac, Peptic Relief)

C Major side effects

1. Constipation (aluminum compounds: aluminum delays passage of stool in GI tract)

2. Diarrhea (magnesium compounds: magnesium stimulates peristalsis in GI tract)

3. Alkalosis (systemic antacids: absorption of alkaline compound into circulation)

4. Reduced absorption of calcium, iron, and most medications (increase in gastric pH)

D Nursing care

1. Instruct regarding

- a. Prevention of overuse of antacids, which can result in rebound hyperacidity
- b. Need for continued supervision
- c. Dietary restrictions related to gastric distress
- d. Foods high in calcium and iron
- e. Need to take 1 hour before or 2 hours after other oral medications
- f. Caution client on sodium-restricted diet because many antacids contain sodium

2. Shake oral suspensions well before administration

3. Administer with small amount of water to ensure passage to stomach

## **Anticholinergics**

A Description

1. Inhibit smooth muscle contraction in GI tract

2. Alleviate pain associated with peptic ulcer
  3. Available in oral and parenteral (IM, IV) preparations
- B Examples: atropine sulfate; dicyclomine (Bentyl); glycopyrrolate (Robinul)
- C Major side effects (all related to decreased parasympathetic stimulation)
1. Abdominal distention and constipation (decreased peristalsis)
  2. Dry mouth (decreased salivation)
  3. Urinary retention (decreased parasympathetic stimulation)
  4. CNS disturbances: e.g., blurred vision, dizziness (direct CNS toxic effect)
- D Nursing care
1. Provide oral care
  2. Monitor for urinary retention

## **Antisecretory Agents**

### A Description

1. Inhibit gastric acid secretion
2. Act at H<sub>2</sub> receptors of stomach's parietal cells to limit gastric secretion (H<sub>2</sub> antagonists)
3. Inhibit hydrogen/potassium ATPase enzyme system to block acid production (proton pump inhibitors); used in conjunction with antibiotics to treat *Helicobacter pylori* infection
4. Available in oral and parenteral (IM, IV) preparations

### B Examples

1. H<sub>2</sub> antagonists: famotidine (Pepcid); ranitidine (Zantac); cimetidine (Tagamet)
2. Proton pump inhibitors: omeprazole (Prilosec); lansoprazole (Prevacid); esomeprazole (Nexium)

### C Major side effects

1. CNS disturbances (decreased metabolism of drug because of liver or kidney impairment)
2. Blood dyscrasias (decreased red blood cells [RBCs], white blood cells [WBCs], platelet synthesis)
3. Skin rash (hypersensitivity)
4. Decrease in bone density with long-term use of acid suppression medications; esomeprazole magnesium (Nexium), lansoprazole (Prevacid), and omeprazole (Prilosec); similar but less risk with cimetidine (Tagamet) and famotidine (Pepcid)

### D Nursing care

1. Do not administer at same time as antacids; allow 1 hour before or 2 hours after other oral drugs
2. Administer oral preparations with meals
3. Assess for potentiation of oral anticoagulant effect
4. Instruct to follow prescription exactly
5. Do not administer for more than 8 weeks without medical supervision

## **Antidiarrheals**

## A Description

1. Slow passage of stool through intestines
2. Promote formation of formed stools; alleviate diarrhea
3. Available in oral and parenteral (IM) preparations

## B Examples

1. Fluid adsorbents: decrease fluid content of stool: bismuth subsalicylate (Kaopectate, Pepto-Bismol)
2. Enteric bacteria replacements: enhance production of lactic acid from carbohydrates in intestinal lumen; acidity suppresses pathogenic bacterial overgrowth; *Lactobacillus acidophilus* (Bacid) and *Lactobacillus bulgaricus* (Lactinex)
3. Motility suppressants: decrease GI tract motility so more water is absorbed from large intestine; diphenoxylate/atropine (Lomotil); loperamide (Imodium)

## C Major side effects

1. Fluid adsorbents: GI disturbances (local effect); CNS disturbances (direct CNS toxic effect)
2. Enteric bacteria replacements: excessive flatulence (increased microbial gas production); abdominal cramps (increased microbial gas production)
3. Motility suppressants: constipation; urinary retention (decreased parasympathetic stimulation); tachycardia (vagolytic effect on cardiac conduction); dry mouth (decreased salivation from anticholinergic effect); sedation (CNS depression); paralytic ileus (decreased peristalsis); respiratory depression (depression of medullary respiratory center)

## D Nursing care

1. Monitor bowel movements for color, characteristics, and frequency
2. Assess for fluid/electrolyte imbalance
3. Assess and eliminate cause of diarrhea
4. Motility suppressants
  - a. Offer sugar-free chewing gum and hard candy to promote salivation
  - b. Warn about interference with ability to perform hazardous activities and risk of physical dependence with long-term use

## **Cathartics/Laxatives**

### A Description

1. Alleviate or prevent constipation and promote evacuation of stool
2. Available in oral and rectal preparations

### B Examples

1. Intestinal lubricants: decrease dehydration of feces; lubricate intestinal tract; mineral oil, olive oil
2. Fecal softeners: lower surface tension of feces, allowing water and fats to penetrate; docusate calcium (Surfak), docusate sodium (Colace)
3. Bulk-forming laxatives: increase bulk in intestinal lumen, which stimulates propulsive movements by pressure on mucosal lining; methylcellulose (Citrucel), psyllium (Metamucil)

4. Colon irritants: stimulate peristalsis by reflexive response to irritation of intestinal lumen; bisacodyl (Dulcolax), senna (Senokot)
5. Saline cathartics: increase osmotic pressure within intestine, drawing fluid from blood and bowel wall, thus increasing bulk and stimulating peristalsis; effervescent sodium phosphate (Fleet Phospho-Soda), magnesium hydroxide (Milk of Magnesia), polyethylene glycol (MiraLax)

#### C Major side effects

1. Laxative dependence with long-term use (loss of normal defecation mechanism)
2. GI disturbances (local effect)
3. Intestinal lubricants: inhibit absorption of fat-soluble vitamins A, D, E, K; may cause anal leaking of oil (accumulation of lubricant near rectal sphincter)
4. Saline cathartics: dehydration (fluid volume depletion resulting from hypertonic state in GI tract); hypernatremia (increased sodium absorption into circulation; shift of fluid from vasculature to intestinal lumen)

#### D Nursing care

1. Instruct regarding overuse of cathartics and intestinal lubricants, increasing intake of fluids and dietary fiber, increasing activity level, and adhering to bowel-retraining program
2. Monitor bowel movements for consistency and frequency of stool
3. Administer at bedtime to promote defecation in morning
4. Encourage to develop healthy bowel habits
5. Intestinal lubricants: use peripad to protect clothing
6. Bulk-forming laxatives: mix thoroughly in 8 oz of fluid and follow with another 8 oz of fluid to prevent obstruction

## ***Intestinal Antibiotics***

(See Infection, [Related Pharmacology](#), Antibiotics in [Chapter 3](#))

## ***Pancreatic Enzymes***

#### A Description

1. Replace natural endogenous pancreatic enzymes (e.g., protease, lipase, amylase); promote digestion of proteins, fats, and carbohydrates
2. Available in oral preparations

B Examples: pancrelipase (Pancreaze); pancreatin (Creon)

C Major side effects: nausea, glossitis, diarrhea, bloating, abdominal discomfort (GI irritation)

#### D Nursing care

1. Administer with meals or snacks
2. Avoid crushing enteric-coated preparations
3. Provide balanced diet to prevent indigestion
4. Administer after histamine 2 blockers

## ***Related Procedures***

### **Colostomy Irrigation**

#### A Definition

1. Instillation of fluid into lower colon via stoma on abdominal wall to stimulate peristalsis and facilitate expulsion of feces
2. Cleansing colostomy stoma and collection of feces (stool consistency will depend on location of ostomy; colostomy of sigmoid colon will produce formed stools; transverse or ascending colostomy will produce less-formed stools)

#### B Nursing care

1. Irrigate stoma at same time each day to approximate usual bowel habits; provide for uninterrupted bathroom use
2. Insert well-lubricated catheter tip (use a cone) into stoma approximately 7 to 8 cm in direction of remaining bowel
3. Hold irrigating container 12 to 18 inches above colostomy; temperature of irrigating solution should be 105° F (40.5° C)
4. Stop flow of fluid temporarily if cramping occurs
5. Provide privacy while waiting for fecal returns or encourage client to ambulate with collection bag in place to further stimulate peristalsis
6. Cleanse peristomal area with soap and water; apply a protective skin barrier
7. Apply colostomy bag with opening  $\frac{1}{8}$  inch away from stoma; use gauze dressing if colostomy is well regulated
8. Teach to control odor when necessary by placing commercially available deodorizer in colostomy bag

### **Endoscopy**

A Definition: visualization of internal organs using hollow tube with lighted end: gastroscopy, stomach; esophagoscopy, esophagus; colonoscopy, entire large colon; sigmoidoscopy, sigmoid colon; proctoscopy, rectum; endoscopic retrograde cholangiopancreatography (ERCP), common bile and pancreatic ducts; capsule endoscopy, swallowed; virtual colonoscopy, series of computed tomography images of the intestine

#### B Nursing care

1. Obtain informed consent for procedure
2. Teach ordered preprocedure protocol: length of time to limit/eliminate food/fluids, laxatives, enemas
3. If rectal examination is indicated, administer cleansing enemas before test
4. Place in knee-chest position for sigmoidoscopy/proctoscopy; left side-lying for colonoscopy
5. After procedure, observe for bleeding, changes in vital signs, or nausea
6. If throat is anesthetized (as for gastroscopy or esophagoscopy), check for return of gag reflex before offering oral fluids
7. Assess for bleeding

8. Care before capsule endoscopy: instruct to fast for 12 hours before test; apply antenna patch and belt holding battery and data recorder; instruct to hold capsule under tongue for 1 minute as unit verifies that light source is functioning and then swallow capsule with 8 ounces of water
9. Care after ingestion of capsule endoscopic device: teach to notify health care provider immediately if experiencing dysphagia, abdominal or chest pain, nausea/vomiting, or fever (risk for obstruction); avoid strong electromagnetic field source until capsule is defecated; avoid strenuous activity, bending, or stooping during test; check that recorder is working every 15 minutes; return the device after capsule is expelled

## **Enemas**

### A Definitions

1. Tap-water: introduction of water into colon to stimulate evacuation
2. Soapsuds: introduction of soapy water into colon to stimulate peristalsis by bowel irritation; contraindicated as preparation for endoscopic procedure because it may alter appearance of mucosa
3. Hypertonic: commercially prepared small-volume enema that works on principle of osmosis
4. Return flow (Harris flush or drip): repeated alternate introduction of water into colon and drainage of that water from colon through same tubing to facilitate exit of flatus
5. Instillation/retention: introduction of a liquid (usually mineral oil) into colon to facilitate fecal activity through lubricating effect

### B Nursing care

1. Provide privacy, place in left side-lying or Sims position
2. Obtain correct solution for the enema ordered
3. Lubricate tip of rectal catheter with water-soluble jelly
4. Insert catheter 3 to 4 inches into rectum
5. Allow solution to enter slowly; keep it no more than 12 inches above rectum; solution may be raised 15 to 18 inches for high cleansing enema; temporarily interrupt flow if cramping occurs
6. Allow ample time for expulsion of enema; encourage prolonged retention of instillation/retention enema
7. Observe and record amount and consistency of returns

## **Gastrointestinal Series**

A Definition: introduction of barium, an opaque medium, into upper GI tract via mouth (upper GI series) or into lower GI tract via rectum for purpose of x-ray visualization for pathologic changes

### B Nursing care

1. Prepare client for procedure
  - a. Maintain nothing by mouth (NPO) for 8 to 10 hours before test
  - b. Administer cathartics and/or enemas as ordered to evacuate bowel

2. Inspect stool after procedure for presence of barium
3. Administer enemas and/or cathartics as prescribed if stool does not return as expected
4. Encourage fluid intake after procedure

## **Gavage (Tube Feeding)**

### A Definitions

1. Nasogastric tube (NGT): tube placed through nose into stomach; has highest risk of aspiration of all types of feeding tubes
2. Intestinal tube: tube placed through nose into small intestine
3. Surgically placed feeding tubes
  - a. Cervical esophagostomy: tube sutured directly into esophagus for clients who have had head and neck surgery
  - b. Gastrostomy (GT): tube placed directly into stomach through abdominal wall and sutured in place; for clients who require tube feeding on long-term basis
  - c. Jejunostomy: tube inserted directly into jejunum for clients with pathologic conditions of upper GI tract
4. Percutaneous endoscopic gastrostomy (PEG) and low-profile gastrostomy device (G-Button)
  - a. Stomach is punctured during endoscopy procedure
  - b. Associated with reduced risks, but accidental removal may occur; low risk with button

### B Nursing care

1. Verify placement of tube before feeding
  - a. Confirm by radiography before initiating tube feedings; test aspirate for acid pH (pH of 1 to 4 confirms gastric placement although the pH can be as high as 6 if client is receiving drugs to reduce gastric acid); inject small amount of air into tube and, with stethoscope placed over epigastric area, listen for passage of air into stomach (less reliable than testing for gastric pH)
  - b. Small-bore tube placement must be verified by radiographic examination
2. Aspirate contents of stomach before feeding to determine residual; follow health care provider's orders or agency policy regarding holding feeding based on residual amounts; *general guidelines*: reinsert 300 mL to avoid electrolyte imbalance and call health care provider for orders; if residual is greater than half of last feeding, call health care provider for orders or follow agency policy; some agencies delay tube feedings for 1 hour if residual amount specified is aspirated when volume is assessed
3. Intermittent feeding
  - a. Position so that head of bed is elevated during feeding
  - b. Verify placement of tube
  - c. Introduce 30 mL of water to verify the patency of tube; tube should not be allowed to empty during feeding
  - d. Slowly administer feeding to prevent regurgitation; administer at room or body temperature; observe and question client to determine tolerance
  - e. Administer 30 mL of water to clear tube at completion of feeding

- f. Clamp tubing and clean equipment
- g. Place in sitting position for 1 hour after feeding; place infant in right side-lying position

#### 4. Continuous feeding

- a. Place prescribed feeding in gavage bag and prime tubing to prevent excess air from entering stomach
- b. Check for residual as per agency policy to verify peristalsis
- c. Set rate of flow; rate of flow can be manually regulated by setting drops per minute or mechanically regulated by using infusion pump
- d. Keep head of bed elevated throughout feeding
- e. Verify placement of tube every 4 hours; generally done when adding additional fluid to feeding
- f. Flush tube intermittently with water to prevent occlusion of tube with feeding; change tubing per protocol
- g. Monitor for gastric distention and aspiration; gastric distention and subsequent aspiration are less frequent because smaller amounts of feeding are administered within a given period
- h. Discard unused fluid that has been in gavage administration bag at room temperature for longer than 4 hours

#### 5. Care common for all clients receiving tube feedings

- a. Elevate head of bed; helps prevent aspiration; facilitates gastric emptying; promotes peristalsis
- b. Monitor for abdominal distention; changes in bowel sounds; assess for diarrhea caused by high osmolarity of feeding; stop tube feeding if nausea and/or vomiting occur or if bowel sounds are not audible; notify health care provider if client is not tolerating feedings
- c. Provide oral hygiene
- d. When appropriate, encourage client to chew foods that will stimulate gastric secretions while providing psychologic comfort; chewed food may or may not be swallowed
- e. Provide special skin care; if client has gastrostomy tube sutured in place, skin may become irritated from gastrointestinal enzymes; if client has a nasogastric tube, skin may become excoriated at point of entry because of irritation
- f. Provide supplemental water to balance hypertonic formula if ordered by health care provider
- g. Care for site of tube entry; cleanse and use water-soluble jelly on nares for NGT; change dressing daily and clean with sterile saline if exudate is present for surgically implanted tubes and PEG tube

## ***Parenteral Replacement Therapy***

### A Definitions

#### 1. Peripheral parenteral nutrition (PPN): short-term use

- a. Administration of isotonic lipid and amino acid solutions through peripheral vein

- b. Amino acid content should not exceed 4%; dextrose content should not be greater than 10%; helps maintain positive nitrogen balance
  - c. Therapy usually limited to 2 weeks
2. Total parenteral nutrition (TPN): long-term use
- a. Administration of carbohydrates, amino acids, vitamins, and minerals via central vein because of high osmolality of solution
  - b. High-osmolality solutions (25% dextrose) are administered in conjunction with 5% to 10% amino acids, electrolytes, minerals, and vitamins; helps maintain positive nitrogen balance
  - c. Long-term home nutritional therapy may be delivered by atrial catheters (Hickman/Broviac or Groshong) that are surgically inserted
3. Intralipid therapy
- a. Infusion of 10% to 20% fat emulsion that provides essential fatty acids
  - b. Provides increased caloric intake to maintain positive nitrogen balance
4. Total nutrient admixture (TNA or 3 in 1)
- a. Combination of dextrose, amino acids, and lipids in one container; vitamins and minerals may be used
  - b. Administered through a central line over 24 hours

## B Nursing care

1. Ensure placement of catheter by chest x-ray examination after insertion; assess for clinical manifestations of accidental pneumothorax, which can occur during insertion (e.g., shortness of breath, unilateral chest pain)
2. Regulate fluid infusion rate; intravenous pump should be used
  - a. Rapid infusion may cause movement of fluid into intravascular compartment, causing dehydration, circulatory overload, and hyperglycemia
  - b. Slow infusion may cause hypoglycemia because body adapts to the high osmolality by secreting more insulin; therefore, therapy is never terminated abruptly but is gradually discontinued; health care provider may order 10% glucose solution to maintain blood glucose level
3. Use filter for TPN; filters not used for lipids
4. Use surgical aseptic technique when changing tubing and applying new dressing
5. Record daily weights and monitor blood glucose levels frequently
6. Check laboratory reports daily, especially glucose, creatinine, blood urea nitrogen (BUN), and electrolytes; check serum lipids and liver function studies if lipids are administered
7. Monitor temperature every 4 hours (infection is most common complication of TPN); if a fever occurs, obtain cultures of blood, urine, and sputum to rule out other sources of infection

## **Paracentesis**

A Definition: removal of fluid from peritoneum to reduce intraabdominal tension or obtain fluid for culture

## B Nursing care

1. Obtain informed consent
2. Have client void before procedure
3. Position upright at edge of bed
4. Monitor vital signs after procedure; assess for clinical findings of hypovolemia (e.g., pallor, oliguria, dyspnea, tachycardia); maintain pressure dressing over needle insertion site

# Major Disorders of the Gastrointestinal System

## Eating Disorders

See [Obesity](#) in this chapter. For Anorexia Nervosa and Bulimia Nervosa, see [Chapter 20, Eating Disorders](#), General Nursing Care of Clients with Eating Disorders.

## Obesity

### **Data Base**

A Etiology and pathophysiology

1. Caloric intake exceeds metabolic needs
2. Complex illness involving metabolic, genetic, and psychologic factors; 30% of African-American and Hispanic-American adults are obese; 25% of European-American adults are obese
3. Research indicates that a stomach hormone, ghrelin, triggers hunger and may be a significant factor in managing weight for a small number of obese clients
4. Major risk factor in coronary heart disease (CHD), brain attack, hypertension, diabetes, arthritis, asthma, bronchitis, and decreased respiratory function; also may increase risk of endometrial, breast, colon, kidney, and gallbladder cancer and degenerative joint disease
5. Research shows that obese individuals are leptin resistant; leptin is thought to communicate to brain when stored fat is sufficient and food intake should cease

B Clinical findings

1. Subjective: undesirable eating patterns; fatigue; feelings of low self-esteem, depression, and disturbed body image
2. Objective
  - a. Obesity—20% or more over ideal body weight
  - b. Morbid obesity—100 lb or more over ideal body weight
  - c. Triceps skinfold greater than 15 mm in men and greater than 25 mm in women
  - d. Observed dysfunctional eating habits
  - e. Behaviors that indicate low self-esteem, depression, and/or disturbed body image

C Therapeutic interventions

1. Weight reduction diet; exercise program; behavior modification
2. Pharmacologic management: appetite suppressants (sibutramine [Meridia]); multivitamins; antidepressants; lipase inhibitors (orlistat [Xenical, Alli])
3. Bariatric surgery for morbid obesity
  - a. Gastric bypass: stomach capacity reduced to less than 50 mL; proximal jejunum is transected and distal end anastomosed to newly created stomach; proximal segment is anastomosed to jejunum
  - b. Laparoscopic adjustable-banded gastroplasty (LAGB): an adjustable band placed around stomach to create a small proximal stomach pouch; adjusted externally; reversible

- c. Body contouring surgery after weight loss: lipoplasty to remove fat deposits; panniculectomy to remove excess abdominal skinfolds. Women of childbearing age should not become pregnant before surgery and for at least 1 to 2 years postoperatively

## **Nursing Care of Clients with Obesity**

### **Assessment/Analysis**

1. Diet (e.g., 24-hour recall, food frequency, and food diary), weight, and exercise history
2. Family history of obesity
3. Emotions just before eating
4. Concurrent health problems and complications of obesity (Figure 8-3: Health risks associated with obesity)

**FIGURE 8-3** Health risks associated with obesity. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011.)

5. Adherence to weight reduction program
6. Medication history for contributing factors (e.g., steroids contribute to weight gain)

### **Planning/Implementation**

1. Review diet and eating patterns to increase awareness of amount and type of foods consumed, and emotions that affect intake
2. Review high- and low-calorie foods, snacks, and beverages; determine how to achieve

daily caloric intake

3. Teach behavior modification techniques (e.g., small plates, preparation of small portions, eating slowly, and chewing thoroughly)
4. Encourage daily walking program and supervised exercise program
5. Suggest opportunities to increase activity in daily life
6. Support emotional needs
7. Encourage counseling and participation in self-help group
8. Teach about modifiable risk factors for CHD and diabetes mellitus and strategies to minimize complications of diabetes
9. Teach about medications (e.g., lipase inhibitors can cause flatus with discharge, fecal urgency, oily evacuation)
10. Provide postoperative care after bariatric surgery (see Perioperative Care, General Nursing Care of Clients during the Postoperative Period in [Chapter 3](#); also see [Nursing Care under Peptic Ulcer Disease](#))
  - a. Assess for wound dehiscence and slow wound healing associated with insufficient blood supply to adipose tissue and excessive skinfolds
  - b. Instruct regarding use of abdominal binder (ability to slip one finger beneath binder easily, remove binder every 4 hours to assess skin for irritation)
  - c. Assess for obesity hypoventilation syndrome
  - d. Use devices to provide for safety and comfort (e.g., large gowns; large bed that converts to chair; extra-wide, heavy-duty wheelchair, walker, and transfer board); ensure accuracy of assessments (e.g., correct size blood pressure cuff)
  - e. Position in semi-Fowler position; use continuous positive airway pressure ventilation at night if experiencing obstructive sleep apnea when ordered
  - f. Provide medication in liquid form
  - g. Encourage six small feedings (usually 600 to 800 calories daily) and fluid intake to prevent dehydration
  - h. Encourage high-protein foods and avoidance of alcohol, sugar, fat, and sweetened beverages
  - i. Teach clinical findings of infection, deep venous thrombosis (DVT), dehydration, and obstruction and need to immediately report these to health care provider
  - j. Encourage to seek help with psychologic issues
  - k. Bypass surgery: teach regarding risk for anemia and calcium and vitamin B<sub>12</sub> deficiencies; may require lifelong nutritional supplementation

## Evaluation/Outcomes

1. Achieves and maintains ideal body weight
2. Verbalizes acceptance of self
3. Remains free of injury
4. Maintains skin integrity
5. Demonstrates adequate depth of respirations

## Fracture of the Jaw

# Fracture of the Jaw

## **Data Base**

### A Etiology and pathophysiology

1. Generally result of trauma such as automobile collisions or physical combat
2. Blowout fractures of orbit may accompany fractured jaw; stabilized surgically with wires, plates, and screws

### B Clinical findings

1. Subjective: history of trauma to face; pain in face and jaw; double vision
2. Objective: bloody discharge from mouth; swelling of face on affected side; difficulty opening or closing mouth; malocclusion

### C Therapeutic interventions

1. Separated fragments of broken bone are reunited and immobilized by wires and rubber bands; usually placed without surgical incision
2. Open reduction of jaw is indicated for severely fractured or displaced bones; interosseous wiring performed

## **Nursing Care of Clients with Fracture of the Jaw**

### **Assessment/Analysis**

1. Respiratory status for presence of distress
2. Nausea and potential for vomiting
3. Structures of face and neck for clinical findings of edema
4. Drainage from nose or ears for presence of cerebrospinal fluid (CSF); CSF dries in concentric rings (Halo sign)

### **Planning/Implementation**

1. Position on side to reduce risk for aspiration pneumonia
2. Control vomiting postoperatively; keep wire cutters at bedside to release wires and rubber bands if emesis occurs; suction oropharynx if vomiting occurs
3. Establish alternate means of communication
4. Explain diet to client and family; no solid foods are permitted; encourage high-protein liquids or soft foods pureed in blender
5. Stress importance of oral hygiene and institute it during postoperative period

### **Evaluation/Outcomes**

1. Adheres to nutritionally balanced safe diet
2. Demonstrates oral hygiene techniques
3. Describes technique for releasing wires and rubber bands if emesis occurs

## **Cancer of the Oral Cavity**

### **Data Base**

## A Etiology and pathophysiology

1. Primarily in clients who smoke, chew tobacco, or drink alcohol in large quantities; usually discovered by dentist
2. Cancer of lip easily diagnosed; prognosis is positive; incidence highest in pipe smokers
3. Cancer of tongue usually occurs with cancer of floor of mouth; metastasis to neck is common
4. Cancer of submaxillary glands; highly malignant and grows rapidly

## B Clinical findings

1. Subjective: pain (not an early symptom); alterations of taste
2. Objective: leukoplakia (white patches on mucosa), which is considered precancerous; ulcerated, bleeding areas in involved structure; lymphadenopathy

## C Therapeutic interventions

1. Reconstructive surgery if indicated
2. Radiation or implantation of radioactive material may arrest growth of tumor
3. TPN, enteral tube feedings
4. Tracheostomy and tube feedings/TPN with extensive head and neck surgery
5. Antineoplastics: cisplatin (Platinol), fluorouracil (Adrucil), paclitaxel (Taxol), docetaxel (Taxotere), carboplatin (Paraplatin), methotrexate (Trexall), gemcitabine (Gemzar)

## ***Nursing Care of Clients with Cancer of the Oral Cavity***

### **Assessment/Analysis**

1. History of hemoptysis and pain
2. Baseline nutritional data (e.g., weight, dietary intake, and ability to chew)
3. Characteristics of lesions in oral cavity

### **Planning/Implementation**

1. Maintain patent airway; keep tracheostomy set at bedside
2. Maintain fluid, electrolyte, and nutritional balance; administer TPN, enteral tube feedings as ordered
3. Relieve dryness of mouth by frequent saline mouthwashes and ample fluids if receiving radiation therapy
4. Consider time and distance in relation to radioactive implants when at bedside

### **Evaluation/Outcomes**

1. Maintains airway patency
2. Maintains nutritional status

## **Gastroesophageal Reflux Disease (GERD)**

### ***Data Base***

#### A Etiology and pathophysiology

1. Backflow of gastric contents into esophagus, gradually breaking down esophageal mucosa
2. Inadequate lower esophageal sphincter (LES) tone, corrosive effects of gastric acid on esophagus, and delayed esophageal and gastric emptying; associated with hiatal hernia, obesity, pregnancy, and caffeine, chocolate, and high-fat food ingestion
3. May lead to Barrett esophagus, a pathologic condition that can progress to esophageal cancer

#### B Clinical findings

1. Subjective: dyspepsia, dysphagia, heartburn (pyrosis), oral release of salty secretions (water brash)
2. Objective: eructation, regurgitation, hoarseness, chronic cough, wheezing, recurrent pneumonia if severe; esophageal pH reveals acid reflux; endoscopy reveals tissue damage

#### C Therapeutic interventions

1. Pharmacological management: histamine receptor agonists, antacids, proton pump inhibitors, cholinergics, prokinetic drugs
2. Dietary management: small, frequent feedings; avoidance of spices, fats, alcohol, chocolate, peppermint, and caffeinated drinks; avoidance of eating 2 to 3 hours before lying down or remaining upright for 2 hours after meals; avoidance of overeating
3. Weight reduction if indicated; eliminating smoking
4. Surgical intervention if medical management is unsuccessful; Nissen fundoplication (sutures tighten fundus around esophagus)
5. Endoscopic therapy (Stretta procedure): radiofrequency energy at high temperatures via endoscopic catheter causes tiny lesions in LES while under conscious sedation; causes tissue tightening, establishing barrier to reflux and reducing LES relaxation

## ***Nursing Care of Clients with Gastroesophageal Reflux Disease***

### **Assessment/Analysis**

1. History of heartburn, regurgitation, dysphagia
2. Baseline weight to determine need for weight loss
3. Dietary and medication history to determine contributing factors

### **Planning/Implementation**

1. Teach dietary guidelines
  - a. Eat small, frequent meals to avoid gastric distention
  - b. Limit fatty foods, which delay gastric emptying
  - c. Avoid foods that decrease LES pressure (e.g., alcohol, peppermints, caffeine, and chocolate)
  - d. Avoid eating or drinking 2 to 3 hours before bedtime; avoid overeating
  - e. Chew gum because it stimulates production of bicarbonate-containing saliva, which neutralizes acid

2. Teach to maintain desirable body weight and avoid tight-fitting clothing and activities that increase intraabdominal pressure
3. Support smoking cessation efforts
4. Elevate head of bed; use extra pillows; avoid exercising or lying down after meals
5. Provide care after endoscopic therapy (Stretta procedure): ensure patent airway; elevate head of bed 45 degrees; monitor vital signs for complications; assess oxygen saturation; suction secretions if necessary; report pain more than 5 (on a scale of 0 to 10) because this may indicate perforation; provide discharge instructions (e.g., avoid nonsteroidal antiinflammatory drugs [NSAIDs] for 10 days, consume soft diet for 2 weeks, crush all pills, and report fever, nausea and vomiting, dysphagia, abdominal discomfort, chest pain, bleeding, and shortness of breath)

## Evaluation/Outcomes

1. Reports reduced episodes of heartburn
2. Maintains desirable body weight

## Cancer of the Esophagus

### Data Base

#### A Etiology and pathophysiology

1. History of alcohol abuse; ingestion of hot, spicy foods; smoking; GERD; or Barrett esophagus (esophageal damage from acid reflux)
2. Additional risk factors: older age, males, African-Americans
3. Most common in middle and lower third of esophagus

#### B Clinical findings

1. Subjective: dysphagia; substernal burning pain, particularly after hot fluids; weight loss; indigestion; and heartburn
2. Objective: regurgitation; hoarseness and cough; esophagogastroduodenoscopy (EGD) with biopsy and brushings demonstrate malignant cells; barium swallow indicates mass

#### C Therapeutic interventions

1. Surgical removal of esophagus is treatment of choice
  - a. Esophagogastrostomy: resection of portion of esophagus in which stomach may be brought up to remaining end of esophagus (gastric pull through)
  - b. Esophagectomy: removal of part or all of esophagus, which is replaced by Dacron graft or portion of colon (colon interposition)
2. Gastrostomy: opening directly into stomach in which a feeding tube is usually inserted to bypass esophagus
3. Radiation and/or chemotherapy may be used before or instead of surgery as palliative measure
4. TPN, enteral tube feedings
5. Photodynamic therapy for palliative treatment; porfimer sodium (Photofrin) is

injected, and several days later a fiberoptic probe in esophagus activates absorbed drug in cancer cells, shrinking them

6. Laser therapy: narrow beam of intense light to kill cancer cells

7. Electrocoagulation: electrical current to kill cancer cells

## ***Nursing Care of Clients with Cancer of the Esophagus***

### **Assessment/Analysis**

1. History of nutritional status and weight loss

2. Presence of pain and dysphagia

3. History of foul breath, eructation, nausea, and vomiting

### **Planning/Implementation**

1. Observe for respiratory distress caused by pressure of tumor on trachea; place in semi-Fowler or high-Fowler position to facilitate respirations

2. Monitor vital signs, especially respirations

3. Provide oral care because dysphagia may result in accumulation of saliva in mouth

4. Maintain nutritional status by providing TPN, tube feedings, high-protein liquids, and vitamin and mineral replacements as ordered

5. Suction oral secretions if necessary

### **Evaluation/Outcomes**

1. Maintains airway

2. Maintains nutritional status

## **Hiatal Hernia**

### ***Data Base***

A Etiology and pathophysiology

1. Portion of stomach protruding through hiatus (opening) in diaphragm into thoracic cavity

2. Caused by congenital weakness of diaphragm or from injury, pregnancy, or obesity

3. Function of cardiac sphincter is lost; gastric juices enter esophagus, causing inflammation

B Clinical findings

1. Subjective: substernal burning pain or fullness after eating; dyspepsia in recumbent position; nocturnal dyspnea

2. Objective: barium swallow, upper GI series, and endoscopy show protrusion of stomach through diaphragm; regurgitation

C Therapeutic interventions

1. Small, frequent, bland feedings

2. Avoidance of overeating, caffeine, smoking, alcohol

3. Wearing of loose-fitting clothing around torso
4. Pharmacologic therapy (see Therapeutic Interventions under GERD) and dietary management
5. Surgical repair (done infrequently)

## **Nursing Care of Clients with Hiatal Hernia**

See [Nursing Care of Clients with Gastroesophageal Reflux Disease](#)

## **Peptic Ulcer Disease (PUD)**

### **Data Base**

#### A Etiology and pathophysiology

1. Ulcerations of GI mucosa and underlying tissues caused by gastric secretions that have low pH (acid)
2. Causes: conditions that increase secretion of hydrochloric acid by gastric mucosa or that decrease tissue's resistance to acid
  - a. Infection of gastric and/or duodenal mucosa by *Campylobacter pylori* or *H. pylori*
  - b. Zollinger-Ellison syndrome: tumors secreting gastrin that stimulates production of excessive hydrochloric acid
  - c. Drugs that decrease tissue resistance (e.g., aspirin, steroids, NSAIDs)
  - d. Smoking
3. Peptic ulcers may be present in esophagus, stomach (pyloric portion most common site), or duodenum
4. Complications include pyloric or duodenal obstruction, hemorrhage, iron depletion, and perforation

#### B Clinical findings

1. Subjective: heartburn (pyrosis); nausea; gnawing or burning epigastric pain 1 to 2 hours after eating (gastric) or 2 to 4 hours after eating (duodenal); pain relieved by food or antacids (duodenal)
2. Objective
  - a. History of gastritis
  - b. If bleeding occurs: indications of anemia; tarry stools (melena); vomitus the color of coffee grounds or port wine; low hemoglobin and hematocrit levels
  - c. *H. pylori* serum antibodies via urea breath test or via biopsy during EGD

#### C Therapeutic interventions

1. Restriction of irritating substances (e.g., nicotine, caffeine, alcohol, spices, gas-producing foods, NSAIDs)
2. Antibiotic therapy if microorganism is identified; tetracycline (Sumycin), metronidazole (Flagyl), and bismuth (Helidac)
3. Histamine H<sub>2</sub> receptor antagonists or proton pump inhibitors to limit gastric acid secretion; antacids to reduce acidity, protectants (e.g., sucralfate [Carafate])
4. Sedatives, tranquilizers, anticholinergics, and analgesics for pain and restlessness

5. Antiemetics for nausea and vomiting
6. Vasoconstrictor to control bleeding
7. Blood transfusion if hemorrhage occurs
8. Nasogastric tube for decompression, instillation of vasoconstrictors, and/or saline lavages when hemorrhage occurs
9. Surgical intervention rarely used because drug therapy usually is effective; used for life-threatening complications (e.g., hemorrhage, perforation, obstruction)
  - a. EGD to treat area with electrocoagulation or heater probe therapy
  - b. Vagotomy: cutting vagus nerve that innervates stomach to decrease secretion of hydrochloric acid
  - c. Billroth I: removal of lower portion of stomach and attachment of remaining portion to duodenum; treatment for carcinoma
  - d. Billroth II: removal of antrum and distal portion of stomach with anastomosis of remaining section to jejunum; treatment for carcinoma
  - e. Antrectomy: removal of antral portion of stomach
  - f. Gastrectomy: removal of 60% to 80% of stomach
  - g. Common complications of partial or total gastric resection
    - (1) Dumping syndrome: rapid passage of food from stomach to jejunum causes diaphoresis, faintness, and palpitations; these clinical manifestations are related to hypertonic food (especially carbohydrates) that draws fluid from circulating blood into jejunum, decreased peripheral vascular resistance, visceral pooling of blood, and reactive hypoglycemia
    - (2) Hemorrhage
    - (3) Pneumonia
    - (4) Pernicious anemia

## ***Nursing Care of Clients with Peptic Ulcer Disease***

### **Assessment/Analysis**

1. Characteristics of pain and relationship to types of food ingested and time food is consumed; whether gnawing sensation is relieved by food
2. Epigastric tenderness, guarding, and bowel sounds
3. History of dietary patterns, foods ingested, alcohol consumption, and foods that exacerbate symptoms

### **Planning/Implementation**

1. Administer and assess effects of sedatives, antacids, anticholinergics, H<sub>2</sub> receptor antagonists, antibiotics, and dietary modifications
2. Encourage hydration to reduce anticholinergic side effects and dilute hydrochloric acid in stomach
3. Provide teaching
  - a. Eat small- to medium-sized meals to help prevent gastric distention; encourage

between-meal snacks to achieve adequate caloric intake

- b. Avoid foods that increase gastric acid secretion or irritate gastric mucosa (e.g., alcohol, caffeine-containing foods and beverages, decaffeinated coffee, red or black pepper); replace offending items with alternatives (e.g., decaffeinated soft drinks and teas; seasonings such as thyme, basil, and sage)
- c. Avoid foods that cause distress; varies for individuals, but common offenders are gas producers (e.g., legumes, carbonated beverages, cruciferous vegetables)
- d. Eat meals in pleasant, relaxing surroundings to reduce acid secretion
- e. Take calcium and iron supplements if prescribed if medication increases gastric pH
4. Refrain from administering drugs that increase hydrochloric acid secretion (e.g., salicylates, NSAIDs, steroids, and adrenocorticotrophic hormone [ACTH])
5. Monitor for complications (e.g., gastric hemorrhage, perforation, and drug toxicity)
6. Allow time to express concerns
7. Provide postoperative care after gastric resection
  - a. Monitor vital signs; assess dressing for drainage
  - b. Maintain patent nasogastric tube to suction, which helps prevent stress on suture line; instill or irrigate nasogastric tube as ordered; monitor electrolytes
  - c. Observe and document color and amount of nasogastric drainage; report excessive bleeding or bright red blood if it occurs after 12 hours
  - d. Encourage coughing, deep breathing, and changing position frequently to prevent pulmonary complications
  - e. Monitor intake and output (I&O)
  - f. Apply antiembolism stockings or sequential compression device if ordered; encourage early ambulation to prevent vascular complications
  - g. Instruct client how to limit or prevent dumping syndrome
    - (1) Eat smaller meals at more frequent intervals
    - (2) Avoid high-carbohydrate intake and concentrated sweets
    - (3) Consume liquids only between meals
    - (4) Assume a reclining position for 1 hour after eating
  - h. Time antacids 1 hour before or 2 hours after other medications

## Evaluation/Outcomes

1. States pain is reduced or relieved
2. Identifies clinical findings of complications and need for immediate medical care
3. Follows nutritionally sound diet

## Cancer of the Stomach

### Data Base

A Etiology and pathophysiology

1. Risk factors: *H. pylori* in stomach; ingestion of smoked meats, salted fish, and processed food containing nitrates; smoking; heredity; disorders such as ulcerative

diseases and pernicious anemia

2. Incidence higher in men older than 40 years of age; Japanese people have greater rate of cancer of stomach than Americans
3. Often not diagnosed until metastasis occurs; stomach accommodates growth of tumor; pain occurs late in disease
4. May metastasize via direct extension, lymphatics, or blood to esophagus, spleen, pancreas, liver, or bone

#### B Clinical findings

1. Subjective: lack of interest in food (anorexia); nausea; belching (eructation); heartburn (dyspepsia)
2. Objective: weight loss; stools positive for occult blood; anemia; absence of hydrochloric acid; pale skin and acanthosis nigricans (a hyperpigmented, velvety thickening of skin in neck, axilla, and groin)

#### C Therapeutic interventions

1. Surgical resection
2. Radiation therapy before and/or after surgery
3. Chemotherapy before and/or after surgery
4. Chemoradiation

## ***Nursing Care of Clients with Cancer of the Stomach***

### **Assessment/Analysis**

1. History of causative factors, pain, and weight loss
2. Axillary lymph nodes and left supraclavicular nodes for hardness indicative of metastasis
3. Skin for color and lesions associated with cancer of GI tract

### **Planning/Implementation**

1. Encourage verbalization of fears (e.g., cancer, death, family problems, self-image)
2. Provide nursing care after gastric resection (see Peptic Ulcer Disease); if a total gastrectomy is performed, the chest cavity usually is entered and chest tubes are inserted (see [Chapter 7, Related Procedures](#), Chest Tubes)
3. Modify diet to include smaller, more frequent meals (see Peptic Ulcer Disease)
4. If a total gastrectomy is performed, vitamin B<sub>12</sub> deficiency results (see [Chapter 6, Anemias and Blood disorders](#), [Data Base](#))
5. Administer gavage feedings as ordered (see [Related Procedures](#), [Gavage \[Tube Feedings\]](#))

### **Evaluation/Outcomes**

1. States relief from discomfort and pain
2. Maintains adequate nutritional status
3. Verbalizes feelings

# Cholelithiasis/Cholecystitis

## Cholelithiasis/Cholecystitis

# Data Base

## A Etiology and pathophysiology

1. Inflammation of gallbladder; usually caused by infection or stones (cholelithiasis), which are composed of cholesterol, bile pigments, and calcium; may be related to hepatic *Helicobacter* bacteria; cannot contract in response to fatty foods entering duodenum because of obstruction by calculi or edema
2. Obstructed common bile duct: bile cannot pass into duodenum and is absorbed into blood, leading to hyperbilirubinemia and jaundice
3. Incidence: highest in obese women in fourth decade; people with cirrhosis, portal hypertension, sickle cell disease, or diabetes; transplantation candidates

## B Clinical findings

1. Subjective: indigestion after eating fatty or fried foods; pain, usually in right upper quadrant of abdomen, which may radiate to back; nausea; itchy skin
2. Objective
  - a. Vomiting; increased temperature and WBC count; clay-colored stool; dark urine; jaundice may be present
  - b. Rebound tenderness in abdomen increasing on inspiration, indicating peritoneal inflammation
  - c. Diagnostic tests
    - (1) Serum bilirubin and alkaline phosphatase levels are increased
    - (2) Ultrasonography determines presence of gallstones
    - (3) Endoscopic retrograde cholangiopancreatography (ERCP) reveals location of gallstones

## C Therapeutic interventions

### 1. Medical management

- a. Nasogastric tube suctioning to reduce nausea and eliminate vomiting
- b. Opioids (drug of choice) to decrease pain by relaxing smooth muscles
- c. Antispasmodics and anticholinergics to reduce gallbladder spasms and contractions
- d. Antibiotic therapy if infection is suspected
- e. Vitamin K to prevent bleeding (vitamin K is fat-soluble and is not absorbed in absence of bile and a deficiency may result in bleeding)
- f. When the surgical risk is high or radiolucent cholesterol stones are small, chenodeoxycholic acid (Chenodiol), or ursodiol (Actigall) administered for 6 to 12 months to dissolve stones
- g. Dissolution of stones by infusing a solvent such as methyl tertiary terbutyl ether (MTBE) into the gallbladder through ERCP
- h. Endoscopic papillotomy via ERCP to retrieve stones in common bile duct
- i. Electrohydraulic shock wave lithotripsy (ESWL): fragmentation of stones by ultrasonic sound waves enables their passage without surgical intervention
- j. Low-fat diet to avoid stimulating gallbladder, which contracts to excrete bile with subsequent pain; calories principally from carbohydrate foods in acute phases; calories may be reduced to 1000 to 1200 if weight loss is indicated; postoperatively

a fat-restricted diet is initiated and progresses to a regular diet

## 2. Surgical intervention

- a. Abdominal cholecystectomy: removal of gallbladder through an abdominal incision
- b. Laparoscopic cholecystectomy: removal of gallbladder through endoscope inserted through abdominal wall; also called endoscopic laser cholecystectomy; not used if infection is present
- c. Choledochotomy: incision into common bile duct for removal of stones

## ***Nursing Care of Clients with Cholelithiasis/Cholecystitis***

### **Assessment/Analysis**

1. Characteristics of pain
2. Pain in relation to ingestion of foods high in fat
3. Pain on inspiration while examiner's fingers are touching site of gallbladder (Murphy sign); due to peritoneal inflammation
4. Stools for color (clay-colored) and fat (steatorrhea); urine for color (dark)
5. Laboratory values for abnormal liver function tests

### **Planning/Implementation**

1. Teach dietary modification to achieve low-fat intake initially because reduced bile flow will reduce fat absorption; supplement with water-miscible forms of vitamins A and E as prescribed
2. Relieve pain preoperatively and postoperatively; administer opioids as prescribed
3. Administer vitamin K as prescribed
4. Provide care after cholecystectomy
  - a. Monitor nasogastric tube attached to suction to prevent distention
    - (1) Maintain patency of tube
    - (2) Assess and measure drainage
  - b. Provide fluids and electrolytes via intravenous route
    - (1) Monitor I&O
    - (2) Check IV site for redness, swelling, heat, or pain
  - c. Maintain in low-Fowler position
  - d. Encourage coughing and deep breathing; splint incision (incision is high and midline, making coughing painful)
  - e. Provide care related to T-tube (if common bile duct is explored, T-tube is inserted to maintain patency)
    - (1) Secure drainage bag; avoid kinking of tube
    - (2) Measure drainage routinely (e.g., every 8 to 12 hours); drainage during first day may be 500 to 1000 mL and then gradually decreases
    - (3) Apply prescribed protective ointments around tube to prevent excoriation
    - (4) When tube is removed (usually in 7 days) observe stool for usual brown color,

which indicates bile is entering duodenum

## Evaluation/Outcomes

1. Verbalizes decrease in pain
2. Maintains nutritional status

## Acute Pancreatitis

### Data Base

#### A Etiology and pathophysiology

1. Inflammation caused by autodigestion by pancreatic enzymes, primarily trypsin
2. Risk factors: gallstones, alcoholism, carcinoma, acute trauma to pancreas or abdomen, or hyperlipidemia
3. Inflammation with or without edema of pancreatic tissues may precipitate suppuration, abscess formation, hemorrhage, necrosis, or duct obstruction

#### B Clinical findings

##### 1. Subjective

- a. Abrupt onset of aching, burning, stabbing, or pressing central epigastric pain; may radiate to shoulder, chest, and back
- b. Abdominal tenderness
- c. Nausea
- d. Pruritus associated with jaundice

##### 2. Objective

- a. Increased temperature
- b. Shallow respirations
- c. Vomiting, weight loss
- d. Change in character of stools (e.g., steatorrhea)
- e. Tachycardia, hypotension, shock
- f. Jaundice
- g. Grossly increased serum amylase and lipase levels
- h. Decreased serum calcium level
- i. Abnormal pancreatic findings on computed tomography (CT) scan
- j. Boardlike abdomen associated with peritonitis

3. Severity depends on cause of problem, amount of fibrous replacement of healthy duct tissue, degree of autodigestion, type of associated biliary disease if present, and amount of interference in blood supply to pancreas

4. Complications may occur such as pseudocysts (dilated space containing blood, necrotic tissue, and enzymes), abscesses, and pancreatic fistulas

#### C Therapeutic interventions

1. Antacids to neutralize gastric secretions
2. Opioids to control pain
3. Bed rest to decrease metabolic demands and promote healing

4. NPO and nasogastric decompression to control nausea, reduce stimulation of pancreas to secrete enzymes, and remove gastric hydrochloric acid
5. Anticholinergics to suppress vagal stimulation and decrease gastric motility and duodenal spasms
6. Antibiotics to prevent secondary infections and abscess formation
7. Pancreatic rest until pain has diminished and bowel sounds return: diet regulated according to extent of condition; NPO; parenteral administration of fluids and electrolytes; TPN via a central line or peripheral route; diet low in fats and proteins, with restriction of stimulants (e.g., caffeine and alcohol)
8. Pancreatic enzymes and bile salts if necessary
9. Surgical intervention if medical management is ineffective (e.g., jaundice persists or a pseudocyst or bleeding occurs); type of surgery is determined by cause (e.g., biliary tract surgery, removal of gallstones, drainage of cysts, temporary stent placement)
10. Treatment for hyperglycemia and administration of insulin as necessary (beta cells of pancreas may be affected by disease process)

## ***Nursing Care of Clients with Acute Pancreatitis***

### **Assessment/Analysis**

1. History of causative factors, pain, and recent weight loss
2. Presence of jaundice
3. Abdomen for rigidity and guarding
4. Presence of hyperglycemia

### **Planning/Implementation**

1. Provide care related to nasogastric tube
  - a. Observe for electrolyte imbalances manifested by clinical findings (e.g., tetany, irritability, jerking, muscular twitching, mental changes, and psychotic behavior)
  - b. Observe for paralytic ileus (e.g., nausea and vomiting, abdominal distention)
  - c. Maintain tube patency
2. Monitor for hyperglycemia
3. Monitor vital signs and oxygen saturation
4. Administer prescribed analgesics
5. Maintain NPO during acute stage of illness; monitor I&O
6. Place in semi-Fowler position and encourage deep breathing and coughing to promote deeper respirations and prevent respiratory problems
7. Monitor parenteral therapy until oral feedings can be tolerated
8. Teach dietary modifications usually starting with small feedings of low-fat, non-gas-producing liquids and progressing to a more liberalized diet low in fat but high in protein and carbohydrates; if fat malabsorption is severe, supplemental vitamins A and E may be necessary; daily supplements of calcium and zinc may also be needed; if insulin secretion is impaired, an American Diabetes Association (ADA) diet is indicated

9. Teach client and family importance of dietary discretion, especially avoidance of alcohol, coffee, spicy foods, and heavy meals
10. Teach importance of taking prescribed medication containing pancreatic enzymes (e.g., amylase, lipase, trypsin) with each meal to improve digestion of food if disease becomes chronic

## Evaluation/Outcomes

1. Reports decrease in pain
2. Maintains nutritional status
3. Demonstrates adequate depth of respirations
4. Maintains fluid and electrolyte balance
5. Maintains serum glucose levels within ordered range

## Cancer of the Pancreas

### Data Base

#### A Etiology and pathophysiology

1. Malignant growth from epithelium of ductal system, producing cells that block pancreatic ducts
2. Fibrosis, pancreatitis, and obstruction of pancreatic duct
3. Lesion metastasizes by direct extension to duodenal wall, splenic flexure of colon, posterior stomach wall, and common bile duct
4. Risk factors: heredity, environmental toxins, alcohol abuse, high-fat diet, and smoking, chronic pancreatitis, diabetes mellitus
5. Incidence higher in middle-aged men than women

#### B Clinical findings

1. Subjective: anxiety; depression; anorexia; nausea; dull, achy pain progressing to severe pain; pruritus associated with jaundice
2. Objective
  - a. Jaundice; weight loss; diarrhea and steatorrhea; clay-colored stools; dark urine; ascites
  - b. Decreased serum amylase and lipase levels because of decreased secretion of enzymes
  - c. Increased serum bilirubin and alkaline phosphatase levels when biliary ducts are obstructed

#### C Therapeutic interventions

1. Glucose monitoring and insulin replacement to control hyperglycemia
2. Drug therapy: pancreatic enzymes, bile salts, and vitamin K to correct deficiencies
3. Analgesics and tranquilizers for pain
4. Biliary stent may be used to relieve jaundice
5. Preparation for surgical intervention: RBC and blood volume replacement; medications to correct coagulation problems and nutritional deficiencies

6. Surgery is treatment of choice, although postsurgical prognosis is grim; Whipple procedure (removal of head of pancreas, duodenum, portion of stomach, and common bile duct); distal pancreatectomy and splenectomy or cholecystojejunostomy (creation of an opening between gallbladder and jejunum to direct bile flow)
7. Palliative surgery: biliary and/or gastric bypass
8. Chemotherapy and radiation when surgery is not possible or desired to provide comfort, or in conjunction with surgery to limit metastasis
9. Chemotherapy: gemcitabine (Gemzar); erlotinib (Tarceva), often used along with gemcitabine; metronomic chemotherapy (small doses over a period of several days has potential to affect cancerous cells as they are dividing)
10. Intraarterial chemotherapy: anticancer drug delivered directly into the pancreas
11. Immunotherapy: uses immune system to directly or indirectly fight the cancer

## ***Nursing Care of Clients with Cancer of the Pancreas***

### **Assessment/Analysis**

1. Presence of jaundice
2. Stool for clay color
3. Urine for dark amber color and frothy appearance
4. Abdomen for enlargement of liver and gallbladder
5. Characteristics of pain
6. History of anorexia, nausea, and weight loss
7. Abdominal dullness on percussion indicating early ascites

### **Planning/Implementation**

1. Provide emotional support for client and family; set realistic goals when planning care
2. Administer analgesics as prescribed and as soon as needed to promote rest and comfort
3. Use soapless bathing and antipruritic agents to relieve pruritus
4. Observe for complications such as peritonitis, gastrointestinal obstruction, jaundice, hyperglycemia, and hypotension
5. Observe stools for undigested fat
6. Monitor vital signs
7. Observe for wound hemorrhage caused by coagulation deficiency; administer vitamin K parenterally as prescribed
8. Encourage coughing, turning, and deep breathing; monitor for respiratory tract infection caused by limited chest expansion resulting from pain at site of incision
9. Monitor I&O; measure abdominal girth
10. Observe for chemotherapeutic and radiation side effects (e.g., skin irritation, anorexia, nausea, vomiting)
11. Maintain skin markings for radiation therapy
12. Support natural defense mechanisms by encouraging frequent and/or supplemental

- feedings of high-nutrient-density foods; encourage immune-stimulating nutrients, especially vitamins A, C, and E, and the mineral selenium
13. Control nausea and vomiting before feedings, if possible
  14. Administer vitamin supplements, bile salts, and pancreatic enzymes, as prescribed
  15. Provide oral hygiene and maintain a pleasant environment, especially at mealtime
  16. Provide care after pancreatic surgery (see [Chapter 3](#), General Nursing Care of Clients during the Postoperative Period; also see Nursing Care under Peptic Ulcer Disease)
    - a. Monitor and maintain mechanical ventilation (see [Chapter 7](#), Related Procedures, Mechanical Ventilation)
    - b. Monitor and maintain patency of multiple drainage tubes and venous and arterial lines
    - c. Monitor for hyperglycemia and malabsorption syndrome
    - d. Monitor for delayed wound healing; may be at risk because of hyperglycemia
    - e. Monitor for hemorrhage, vascular collapse, and hepatorenal failure
    - f. Prevent infection (e.g., maintain skin integrity, protect integrity of surgical incision, use sterile technique when changing dressing)
    - g. Meet emotional needs during this critical and stressful postoperative period

## Evaluation/Outcomes

1. States that pain is controlled
2. Maintains nutritional status
3. Maintains fluid and electrolyte balance
4. Discusses feelings and concerns
5. Maintains serum glucose levels within ordered range
6. Avoids infection

## Hepatitis

### **Data Base**

#### A Etiology and pathophysiology

1. Acute or chronic inflammation caused by bacterial or viral infection, parasitic infestation (usually by contaminated water or food), or chemical agents
2. Hepatic dysfunction may impair clotting mechanisms
3. Hepatitis A (formerly known as infectious hepatitis)
  - a. Caused by hepatitis A virus (HAV)
  - b. Transmitted via fecal-oral route, contamination associated with floodwaters, or contaminated food (e.g., shellfish)
  - c. Excreted in large quantities in feces 2 weeks before and 1 week after onset of clinical findings
  - d. Incubation period 15 to 50 days
  - e. Confers immunity on individual; carrier state is possible
  - f. Serum studies

(1) Anti-HAV: antibodies usually apparent once clinical findings appear and last up to 12 months

(2) Immunoglobulin M (IgM) anti-HAV: antibodies indicate recent infection

g. Vaccine: hepatitis A vaccine provides long-term protection

#### 4. Hepatitis B (formerly known as serum hepatitis)

a. Caused by hepatitis B virus (HBV)

b. Transmitted by

(1) Contaminated blood products or articles (e.g., toothbrush, razor, needle)

(2) Other body secretions (e.g., saliva, semen, urine)

(3) Introduction of infectious material into eye, oral cavity, lacerations, or vagina

(4) Shared contaminated needles

c. Incubation period 28 to 160 days

d. Serum studies

(1) HBsAg—hepatitis B surface antigen: indicates infectious state

(2) Anti-HBs: antibody to surface antigen indicates immune response

(3) HBeAg—hepatitis Be antigen: indicates highly infectious state and possible progression to chronic hepatitis

(4) Anti-HBe: antibody found in recovery

(5) HBcAg: core antigen of hepatitis B; found in liver cells

(6) Anti-HBc: antibody most sensitive indicator of prior HBV infection

e. Vaccine: three doses of hepatitis B vaccine provide immunity in 90% of healthy adults; dosing interval—initial dose, 1 month, 6 months

#### 5. Hepatitis C

a. Caused by hepatitis C virus (HCV)

b. Transmitted through blood and blood products

c. Incubation period is 15 to 160 days following exposure (average 50 days)

d. Serum studies

(1) Hepatitis C virus antibodies

(2) Hepatitis C virus RNA

(3) Hepatitis C genotyping

e. Chronic carrier state possible; associated with hepatic cancer

#### 6. Hepatitis D

a. Caused by hepatitis D virus (HDV)

b. Transmitted through blood and blood products and close personal contact

c. Incubation period is unknown

d. Chronic carrier state possible

e. Serum studies

(1) HDsAg—hepatitis D antigen: can be detected early

(2) Anti-HDV antibody: indicates past or present infection

#### 7. Hepatitis E

a. Caused by hepatitis E virus (HEV)

b. Transmitted through fecal-oral route

- c. Incubation period is 15 to 65 days
- d. Onset of clinical findings is similar to other types of hepatitis; clinical findings are severe in pregnant women

#### 8. Hepatitis G

- a. Caused by hepatitis G virus (HGV)
- b. Transmitted percutaneously through blood, needles, body fluids
- c. Incubation period is unknown
- d. Bloodborne RNA virus frequently associated with human immunodeficiency virus (HIV) infection

9. Nonviral, toxic, or drug-induced hepatitis: caused by drug therapy or other chemicals (e.g., carbon tetrachloride, chloroform, gold compounds, isoniazid [INH], halothane, acetaminophen)

10. Phases of disease: prodromal (preicteric), icteric, and recovery

11. Progression to cirrhosis, hepatic coma, and death

#### B Clinical findings

- 1. Prodromal (preicteric) phase: malaise, anorexia, nausea, vomiting, and weight loss; upper respiratory tract infection; intolerance for cigarette smoke
- 2. Icteric phase: jaundice, bile-colored urine that foams when shaken; acholic (clay-colored) stools
- 3. Recovery phase: fatigability

#### C Therapeutic interventions

- 1. Rest
- 2. Diet therapy
  - a. Moderate to high-protein intake to heal liver tissue (approximately 75 to 100 g); avoidance of alcohol
  - b. High carbohydrate (approximately 300 to 400 g) to meet daily energy needs and restore glycogen reserves
  - c. Low fat
  - d. High calorie (approximately 2500 to 3000) to meet increased energy needs for disease process and tissue regeneration and to spare protein for healing
  - e. Supplements of calcium and zinc and vitamins A and E when steatorrhea is present
- 3. Bile acid sequestrants (e.g., cholestyramine [Questran]) to reduce pruritus
- 4. Avoidance of hepatotoxic drugs (e.g., acetaminophen, aminoglycoside antibiotics, sedatives)
- 5. Antiviral agents (e.g., interferon [Intron, Roferon, Infergen]); chronic hepatitis B: Telbivudine (Tyzeka), lamivudine (Epivir, Epivir HBV); hepatitis C: interferon (Intron) and ribavirin (Rebetol), and protease inhibitors
- 6. Liver transplantation

## ***Nursing Care of Clients with Hepatitis***

### **Assessment/Analysis**

1. History of exposure to virus; foreign travel
2. History of exposure to environmental factors over previous 6 months
3. Right upper quadrant for liver tenderness, firmness
4. Presence of jaundice in skin, sclera, and mucous membranes
5. Temperature to determine presence of fever (associated with type A) or low-grade fever (associated with types B and C); fatigue
6. Presence of bleeding tendencies

## Planning/Implementation

1. Encourage rest and quiet activities; protect from injury to prevent bleeding
2. Attempt to stimulate appetite
  - a. Encourage meticulous oral hygiene
  - b. Encourage intake of preferred foods
  - c. Provide pleasant, unhurried atmosphere
  - d. Offer small, frequent feedings because they are tolerated better than large meals
3. Use standard precautions to prevent transmission to others; hepatitis A or E: use contact precautions when exposed to feces
4. Teach prevention
  - a. Thorough hand hygiene
  - b. Contact precautions for exposure to feces, blood, or body secretions
  - c. Meticulous handling of needles (e.g., dispose of needles without recapping to prevent self-injury and contamination, dispose of needles in hard-sided container)
  - d. Administration of immune serum globulin (ISG) after exposure to HAV and administration of hepatitis B immune globulin (BayHep B) after exposure to HBV to provide passive immunity
  - e. Vaccinations against HAV (Havrix, VAQTA) and against HBV (Recombivax HB)
  - f. Use of condoms

## Evaluation/Outcomes

1. States an increase in energy
2. Adheres to prescribed diet
3. Remains free of complications
4. Follows precautions to prevent transmission

## Hepatic Cirrhosis

### Data Base

A Etiology and pathophysiology

1. Irreversible fibrosis and degeneration of the liver
2. Types of cirrhosis
  - a. Alcoholic (Laënnec) cirrhosis: related to alcohol abuse
  - b. Postnecrotic or macronodular: related to viral hepatitis B and C and industrial

chemical exposure; most common form worldwide

c. Biliary: related to biliary stasis in hepatic ducts; may be an autoimmune response

d. Cardiac: results from long-term right-sided heart failure; least common form

3. Pressure increases in portal system (which drains blood from the digestive organs), causing stasis and backup of fluids in digestive organs and lower extremities (portal hypertension)

4. Protein metabolic wastes build up and ammonia levels increase

5. As liver failure progresses, there is increased secretion of aldosterone, decreased absorption and utilization of fat-soluble vitamins (A, D, E, K), and ineffective detoxification of protein wastes

6. GI bleeding results from esophageal varices

7. Hepatic coma (hepatic encephalopathy) results from increased blood ammonia levels when liver is unable to convert ammonia to urea

8. Fat accumulation in liver tissue

## B Clinical findings

1. Subjective: anorexia; nausea; weakness; fatigue; abdominal discomfort; pruritus

2. Objective

a. Loss of muscle mass with weight gain caused by fluid retention; ascites; esophageal varices resulting from portal hypertension; hemorrhoids; varicose veins; edema of extremities; hematemesis; jaundice (icterus); delirium caused by rising blood ammonia levels; fetor hepaticus (sweet odor to breath)

b. Increased liver enzymes (aspartate aminotransferase [AST], alanine aminotransferase [ALT], alkaline phosphatase [ALP], gamma-glutamyl transferase [GGT])

c. Decreased serum albumin level; increased serum bilirubin level

d. Prolonged prothrombin time that may result in hemorrhage

## C Therapeutic interventions

1. Rest for energy conservation

2. Avoidance of alcohol intake

3. Vitamin therapy: especially fat-soluble vitamins A, D, E, and K and vitamin B (thiamine chloride and nicotinic acid); zinc and calcium supplements

4. Diuretics to control ascites and edema

5. Neomycin and lactulose may be prescribed for increased blood ammonia levels

6. Colchicine (Colcrys), an antiinflammatory agent, may increase survival in moderate cirrhosis

7. Treatment of esophageal varices

a. Vasopressin (Pitressin) in high doses acts as nonadrenergic peripheral vasoconstrictor

b. Octreotide (Sandostatin, Sandostatin LAR)

c. Endoscopic sclerotherapy: sclerosing agent is injected endoscopically into the varices, causing thrombosis and hemostasis; first-line treatment for active variceal bleeding

d. Balloon tamponade with Sengstaken-Blakemore tube for bleeding esophageal

varices to apply direct pressure to varices

8. Maintenance of respiratory function and adequate oxygen saturation; paracentesis if ascites causes respiratory distress
9. Surgery to decrease portal hypertension: circulation from portal vein bypasses liver and enters vena cava (portal caval shunt); peritoneovenous shunt (LeVeen or Denver) to move fluid from abdominal cavity to superior vena cava; liver transplantation
10. Dietary modification
  - a. Cirrhosis
    - (1) Protein as tolerated (80 to 100 g); with increasing liver damage, protein metabolism is hindered
    - (2) High carbohydrate, moderate fat increases energy
    - (3) Low sodium (500 to 1000 mg daily) to help control increasing ascites
    - (4) Soft foods if esophageal varices are present to prevent bleeding and rupture
    - (5) Vitamin, mineral, and electrolyte supplements; vitamin B and fat-soluble vitamins A, D, E, and K
    - (6) Alcohol and hepatotoxic agents contraindicated to avoid irritation and malnutrition
  - b. Hepatic coma
    - (1) Protein reduced to 15 to 30 g when blood ammonia level increase greater than 200 mcg/dL
    - (2) High-calorie diet (1500 to 2000 g) to prevent catabolism and liberation of nitrogen
    - (3) Fluid intake controlled according to output and extent of ascites and edema

## ***Nursing Care of Clients with Hepatic Cirrhosis***

### **Assessment/Analysis**

(Figure 8-4: Systemic clinical manifestations of liver cirrhosis)

**FIGURE 8-4** Systemic clinical manifestations of liver cirrhosis. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011.)

1. History of anorexia, dyspepsia, alcohol abuse or exposure to hepatotoxic agents; loss of muscle mass with weight gain caused by fluid retention
2. Abdomen for pain and liver tenderness; dullness when percussing enlarged liver
3. Abdominal girth measurements for baseline data relative to ascites; weight gain
4. Skin for presence of jaundice, dryness, petechiae, ecchymoses, spider angiomas, and palmar erythema
5. Clinical findings of hepatic coma (e.g., confusion, flapping of extremities)

## Planning/Implementation

1. Observe for bleeding
2. Monitor liver function studies, complete blood count (CBC), and renal function studies
3. Provide high-calorie, protein-restricted diet
4. Provide special skin care and trim nails because pruritus is associated with jaundice
5. Maintain semi-Fowler position to prevent ascites from causing dyspnea
6. Monitor I&O, abdominal girth, and daily weight to assess fluid balance
7. Assist with paracentesis (see [Paracentesis under Related Procedures](#))
8. Provide care associated with Sengstaken-Blakemore tube
  - a. Maintain traction after tube is passed and gastric balloon is inflated to ensure correct placement
  - b. Maintain esophageal balloon at inflated level (30 to 35 mm Hg)
  - c. Deflate balloon for a few minutes at specific intervals to prevent necrosis if ordered

- d. Irrigate with saline if ordered
- e. Maintain a patent airway; suction orally as necessary because client will be unable to swallow saliva
- 9. Provide care after endoscopic sclerotherapy: monitor for complications (e.g., perforated esophagus, aspiration pneumonia, pleural effusion, and increasing ascites); support respiratory status
- 10. Repeat instructions to client and family; ability of client to understand and remember is often impaired because of hepatic encephalopathy
- 11. Monitor for impending hepatic coma

## Evaluation/Outcomes

- 1. Follows dietary regimen
- 2. Maintains fluid balance
- 3. Remains free from complications

## Cancer of the Liver

### Data Base

#### A Etiology and pathophysiology

- 1. May be primary or metastatic; primary carcinoma (e.g., hepatocellular cancer, hepatoma) of liver is rare
- 2. Contributing factors: hepatitis B and C, cirrhosis, alcoholism, and anabolic steroid use
- 3. Lack of bile causes inadequate vitamin K absorption, resulting in deficient prothrombin synthesis and subsequent bleeding
- 4. Poor prognosis

#### B Clinical findings

- 1. Subjective: anorexia, ache in epigastric area, weakness, malaise
- 2. Objective: weight loss, bleeding, fever, anemia, jaundice, ascites, increased serum bilirubin level; increased alkaline phosphatase level; confusion, lethargy, lower-extremity edema

#### C Therapeutic interventions

- 1. Palliative interventions
- 2. Hepatic lobectomy if tumor is confined; can be done via laparoscopic resection; liver transplantation
- 3. Chemotherapy: DOXOrubicin, 5-fluorouracil (5-FU), darunavir (Prezista), ibritumomab tiuxetan (Zevalin); targeted drug therapy with sorafenib (Nexavar)
- 4. Percutaneous infusions with cytotoxic agents: fluorodeoxyuridine (FUDR), Yttrium-90 microspheres, ethanol
- 5. Radiofrequency ablation, cryosurgery, embolization of blood vessels supplying the tumor, injection of alcohol or anticancer drugs into the tumor
- 6. Photodynamic therapy: photosensitizing drug and laser light to destroy cancer cells
- 7. External radiation therapy

# ***Nursing Care of Clients with Cancer of the Liver***

## **Assessment/Analysis**

1. Weight to assess ascites and nutritional status
2. Skin for jaundice, bleeding, and pallor
3. Presence of dullness when percussing over liver; ascites
4. Detailed history including exposure to any known causative agents

## **Planning/Implementation**

1. Provide for comfort and pain relief; help to combat fatigue and conserve energy
2. Be available to both client and family members to discuss their feelings
3. Maintain fluid and electrolyte balance; monitor I&O
4. Observe for clinical findings of bleeding, esophageal varices, hypoglycemia, and other metabolic dysfunctions resulting from impaired liver function
5. Encourage coughing, deep breathing, and changing positions frequently to prevent pulmonary and circulatory complications
6. Implement care associated with chest tubes because thoracic cavity may be entered during hepatic surgery (see [Chapter 7, Related Procedures](#), Chest Tubes)

## **Evaluation/Outcomes**

1. Verbalizes feelings about diagnosis and prognosis
2. Maintains fluid balance
3. Remains comfortable
4. Remains free from injury-related altered coagulation

## **Appendicitis**

### ***Data Base***

#### **A Etiology and pathophysiology**

1. Compromised circulation and inflammation of vermiform appendix; inflammation may be followed by edema, necrosis, rupture, peritonitis
2. Causes: obstruction by a fecalith, foreign body, or kinking

#### **B Clinical findings**

1. Subjective: anorexia, nausea, right lower quadrant pain (McBurney point), rebound tenderness
2. Objective: vomiting; fever; leukocytosis; abdominal distention and paralytic ileus if appendix has ruptured

#### **C Therapeutic interventions**

1. Surgical removal of appendix immediately to decrease risk of rupture and peritonitis
2. Prophylactic antibiotics
3. Maintenance of fluid and electrolyte balance
4. Analgesics for pain

# ***Nursing Care of Clients with Appendicitis***

## **Assessment/Analysis**

1. History of characteristics of pain, nausea, vomiting
2. Presence of anorexia or urge to pass flatus
3. Presence of rebound tenderness when palpating abdomen
4. Presence of tenderness/rigidity when palpating McBurney point (Rovsing sign); located between the anterior iliac crest and the umbilicus in the right lower quadrant of the abdomen
5. Temperature for baseline data
6. Presence and extent of bowel sounds

## **Planning/Implementation**

1. Provide emotional support because this condition is unanticipated and client needs to ventilate concerns
2. Monitor fluid and electrolyte balance
3. Assess for signs of infection; maintain semi-Fowler position to help localize infection in lower abdominal cavity if appendix ruptures
4. Assess for return of bowel function (e.g., bowel sounds, flatus, bowel movement); encourage ambulation

## **Evaluation/Outcomes**

1. States pain is alleviated
2. Remains free from infection

# **Irritable Bowel Syndrome (IBS)**

## ***Data Base***

### **A Etiology and pathophysiology**

1. Functional motility disorder of intestines
2. Cause unknown; possibly related to serotonin associated with neurologic hormonal regulation; vascular or metabolic disturbance; infection; irritation; heredity; psychologic stress; depression and anxiety; high-fat diet; irritating foods; alcohol consumption
3. Affects approximately 25% population; affects more women than men

### **B Clinical findings**

1. Subjective: left lower quadrant abdominal pain that may be precipitated by eating and/or relieved by defecation; bloating, abdominal cramps, dyspepsia
2. Objective: constipation, diarrhea, or combination of both; abdominal distention; barium enema and colonoscopy may indicate spasm or mucus accumulation in intestines

### **C Therapeutic interventions**

1. Hydrophilic colloids (bulk) and antidiarrheal agents to control diarrhea; anticholinergics and calcium channel blockers to minimize smooth muscle spasm
2. Initially NPO with gradual reintroduction of foods to a healthy high-fiber diet; avoidance of foods that trigger an exacerbation (e.g., wheat and or gluten, caffeine-containing products, artificial sweeteners, citrus fruits)
3. Antidepressants; stress reduction and/or behavior modification program
4. Broad-spectrum antibiotic; rifaximin (Xifaxan) shown to reduce overall clinical findings
5. Alosetron hydrochloride (Lotronex), blocks action of serotonin decreasing motility
6. Antispasmodics: chlordiazepoxide/clidinium (Librax), dicyclomine (Bentyl)

## ***Nursing Care of Clients with Irritable Bowel Syndrome***

### **Assessment/Analysis**

1. Presence of pain, bloating, and abdominal cramps; factors (e.g., food, emotional) precipitating an event; dietary habits
2. History of pattern and characteristics of bowel elimination
3. Presence and extent of bowel sounds

### **Planning/Implementation**

1. Instruct client to
  - a. Eliminate irritating and gas-producing substances
  - b. Add fiber to diet
  - c. Schedule meals regularly
  - d. Chew thoroughly and eat slowly
  - e. Minimize beverages with meals to avoid distention
  - f. Avoid smoking and alcohol
  - g. Maintain an adequate fluid intake
  - h. Perform meticulous perianal skin care
2. Encourage adherence to prescribed medication regimen (e.g., antidiarrheal, bulk-forming laxatives, and/or antispasmodics)
3. Encourage use of stress management strategies
4. Provide emotional reassurance

### **Evaluation/Outcomes**

1. Reports reduction in pain
2. Reports decrease in diarrhea/constipation
3. Maintains nutritional status
4. Maintains fluid and electrolyte balance
5. Implements strategies to reduce emotional stress
6. Maintains skin integrity

## **Malabsorption Syndrome**

## **Data Base**

### A Etiology and pathophysiology

1. Failure to absorb one or more of necessary ingested nutrients; can occur anywhere along digestive tract
2. May be primary disorder (e.g., celiac sprue or lactase deficiency) or secondary to gastric or intestinal surgery (e.g., short-bowel syndrome), inflammatory disease, infection, radiation, or drug side effects

### B Clinical findings

1. Subjective: weakness, fatigue, anorexia, and decreased feeling of well-being
2. Objective: weight loss, flatulence, borborygmus (loud bowel sounds), abdominal distention, diarrhea or bulky stool, steatorrhea (greasy, bulky, mushy stool with foul odor); clinical findings of deficient protein and fat-soluble vitamin intake; dehydration; low serum values (e.g., albumin, transferrin, total lymphocyte count, hemoglobin, and hematocrit); lactose intolerance; biopsy of mucosa indicative of pathology; deficiencies in specific absorption tests

### C Therapeutic interventions

1. Resolution of precipitating event
2. Dietary therapy: avoidance of aggravating substances, supplementation of needed nutrients, reduction/elimination of gluten (e.g., wheat, rye, oats, barley) intake for celiac sprue, restriction of milk, and/or enzyme supplementation for lactose intolerance; tube feedings, PPN, or TPN during exacerbations
3. Administration of antidiarrheals, antispasmodics, antibiotics, and vitamins as indicated

## **Nursing Care of Clients with Malabsorption Syndrome**

### **Assessment/Analysis**

1. Weight, dietary habits, fluid and electrolyte status
2. Stools for frequency, color, consistency, and steatorrhea
3. Extent of bowel sounds, abdominal distention, flatulence
4. Clinical findings of specific deficiencies (e.g., protein, vitamins)
5. Presence of fatigue, weakness, and anorexia
6. Laboratory data reflective of nutritional status

### **Planning/Implementation**

1. Monitor weight, fluid and electrolyte balance; monitor for clinical findings associated with cause of the malabsorption
2. Instruct regarding dietary restrictions/modifications
3. Provide supplements or assist with PPN or TPN as prescribed

### **Evaluations/Outcomes**

1. Maintains or regains weight

2. Adheres to dietary regimen
3. Maintains fluid and electrolyte balance
4. Verbalizes an increase in energy
5. Reports decrease in frequency of episodes of diarrhea

## Inflammatory Bowel Disease, Regional Enteritis (Crohn Disease)

### **Data Base**

#### A Etiology and pathophysiology

1. Ulceration of intestinal submucosa accompanied by congestion, thickening of small bowel, and fissure formations; fistulas and abscesses may form
2. Cobblestone ulcerations along mucosal wall of terminal ileum, cecum, and ascending colon form scar tissue that inhibits food and water absorption
3. Cause unknown; theories include genetic predisposition, autoimmune reaction, or environmental factors

#### B Clinical findings

1. Subjective: nausea, severe abdominal pain, cramping, and spasms; exacerbations related to emotional upsets or dietary indiscretions (e.g., milk, milk products, fried foods)
2. Objective
  - a. Weight loss; fever; increased WBC count; diarrhea with mucus; electrolyte disturbances; blood and fat in feces; enlarged regional lymph nodes
  - b. Endoscopy with biopsy confirms diagnosis
  - c. Barium study of upper GI tract reveals stricture of ileum (string sign)
  - d. Fecal fat test determines fat content (excessive amount is significant in malabsorptive disorders or hypermotility)
  - e. Erythema nodosum, conjunctivitis, and arthritis
  - f. D-Xylose tolerance test determines absorptive ability of upper intestinal tract
  - g. CT scan reveals bowel wall thickening and fistulas

#### C Therapeutic interventions

1. NPO and TPN when inflammatory episodes are severe
2. Clear fluid diet progressing to bland, low-residue, low-fat; increased calories, carbohydrates, proteins, and vitamins, especially K and B<sub>12</sub> when large portion of ileum is involved
3. Pharmacologic management: monoclonal antibody form of antitumor necrosis factor (e.g., infliximab [Remicade], adalimumab [Humira]); antiinflammatories (e.g., sulfasalazine [Azulfidine], mesalamine [Asacol, Lialda, Pentasa]); anticholinergics; antiinfectives (e.g., metronidazole [Flagyl], ciprofloxacin [Cipro]); corticosteroids; antidiarrheals (e.g., loperamide [Imodium], bismuth subsalicylate [Pepto-Bismol, Kaopectate])
4. Surgery when complications (e.g., fistulas, intestinal obstruction) occur; resection with

anastomosis or a temporary or permanent ostomy

5. Maintenance of fluid and electrolyte balance

## ***Nursing Care of Clients with Crohn Disease***

### **Assessment/Analysis**

1. Weight, temperature, and I&O
2. Feces for color, consistency, and steatorrhea
3. Tenderness and guarding of abdomen, especially right lower quadrant
4. Presence and extent of bowel sounds

### **Planning/Implementation**

1. Encourage verbalization of feelings; encourage client and family to participate in the Crohn and Colitis Foundation of America
2. Monitor for fluid and electrolyte imbalances and I&O
3. Monitor for complications (e.g., increased temperature, increasing nausea and vomiting, abdominal rigidity)
4. Assist with TPN if prescribed (see [Parenteral Replacement Therapy under Related Procedures](#))
5. Teach client to
  - a. Adhere to dietary restrictions and modifications (see [Ulcerative Colitis under Inflammatory Bowel Disease](#))
  - b. Avoid taking laxatives and salicylates that irritate intestinal mucosa
  - c. Follow package directions when taking antidiarrheals and mucilloid drugs
  - d. Provide skin care if perianal area is irritated
  - e. Seek help early when exacerbations occur
6. Provide preoperative and postoperative care for intestinal surgery (see [Nursing Care under Inflammatory Bowel Disease, Ulcerative Colitis](#))

### **Evaluation/Outcomes**

1. Reports reduction in pain
2. Reports decrease in number of bowel movements
3. Maintains nutritional status
4. Maintains fluid and electrolyte balance
5. Implements strategies to reduce emotional stress

## **Inflammatory Bowel Disease, Ulcerative Colitis**

### ***Data Base***

A Etiology and pathophysiology

1. Edema of mucous membrane of colon leads to bleeding and shallow ulcerations; bowel wall shortens and becomes thin and fragile; abscess formation may occur

2. Causes: autoimmune response, genetic predisposition, bacterial infection; emotional stress

3. Associated with increased risk for colon cancer

#### B Clinical findings

1. Subjective: weakness, debilitation, anorexia, nausea, abdominal cramps

2. Objective: dehydration with tenting of skin; frequent passage of bloody, purulent, mucoid, watery stools; anemia; hypocalcemia; low-grade fever

#### C Therapeutic interventions

1. Dietary management

a. During acute episode: low-residue diet progressing to regular diet

b. Maintenance: high-protein, high-calorie diet; raw bran may be effective in controlling bouts of diarrhea and constipation; avoidance of food allergens, especially milk

c. Unrestricted fluid intake if tolerated

2. Pharmacologic management: antiemetics, anticholinergics, corticosteroids, antibiotics, sedatives, analgesics, tranquilizers, and antidiarrheals; antiinflammatories (e.g., mesalamine [Asacol, Lialda, Pentasa], olsalazine [Dipentum], sulfasalazine [Azulfidine]); immune system suppressors (e.g., azathioprine [Azasan, Imuran], mercaptopurine [Purinethol], cycloSPORINE [Gengraf, Neoral]); monoclonal antibody form of antitumor necrosis factor (e.g., infliximab [Remicade]); nicotine patches may be used for short-term exacerbations

3. Replacement of fluids and electrolytes lost with diarrhea; TPN may be instituted

4. Surgical intervention indicated when medical management is unsuccessful

a. Segmental or partial colectomy with anastomosis

b. Total colectomy with ileostomy

c. Total colectomy with incontinent or continent ileostomy

d. Total colectomy with ileoanal anastomosis (creation of an ileal pouch that maintains anal sphincter function)

## ***Nursing Care of Clients with Ulcerative Colitis***

### **Assessment/Analysis**

1. Localized areas of tenderness found over diseased bowel on palpation

2. History of patterns and characteristics of bowel elimination

3. Feces for color, consistency, and characteristics

4. Temperature and weight for baseline data

5. Presence and extent of bowel sounds

6. Nutritional status

### **Planning/Implementation**

1. Involve in dietary selections; incorporate preferences as much as possible

2. Initiate administration and documentation of fluid, electrolyte, or blood replacements

3. Provide gentle, thorough perineal care
4. Monitor for complications (e.g., rectal hemorrhage, fever, dehydration, electrolyte imbalances)
5. Encourage client and family to verbalize feelings and participate in care; encourage participation in Crohn and Colitis Foundation of America
6. Instruct client to
  - a. Eat small, frequent meals of high-protein, high-calorie foods; low-fat diet to decrease steatorrhea; vitamins A and E may be supplemented if steatorrhea is present
  - b. Avoid irritating foods and spices
  - c. Take prescribed supplements (e.g., iron, calcium, zinc)
  - d. Self-administer prescribed monthly vitamin B<sub>12</sub> injections to treat anemia associated with ileal involvement
  - e. Avoid all food allergens, especially milk; milk may be reintroduced when relatively asymptomatic; lactose intolerance is common and dairy restrictions may be permanent; lactase enzymes can be added to milk products to hydrolyze lactose
7. Provide preoperative care; arrange for nurse specialist to assist in preoperative stoma site assessment and marking (poorly placed stoma will prevent tight seal of pouch, contributing to leakage, skin excoriation, incompatibility with clothing, and decreased quality of life)
8. Provide postoperative care
  - a. Maintain nasogastric suction during immediate postoperative period
  - b. Provide colostomy care (see [Colostomy Irrigation under Related Procedures](#))
  - c. Monitor fecal drainage and fluid balance ([Figure 8-5](#): Consistency of feces depending on intestinal location)

**FIGURE 8-5** Consistency of feces depending on intestinal location. As the feces move from the ileocecal valve to the anus, water is absorbed and the feces become more solid. The characteristics of the output from a colostomy depend on its location in the colon. (From Mahan LK, Escott-Stump S: *Krause's food and nutrition therapy*, ed 12, St. Louis, 2008, Saunders.)

- d. Assess for clinical findings of peritonitis
- e. Assess viability of stoma: expected—brick red; inadequate perfusion—gray, pale pink, dark purple
- f. Teach ileostomy care
  - (1) Ileostomy: skin care, continuous use of appliance because stoma drains continuously
  - (2) Continent ileostomy (Kock pouch): pouch will stretch over time to hold over 500 mL; must be catheterized to drain effluent every 4 to 6 hours; external appliance unnecessary; small dressing covers stoma
- g. Teach dietary guidelines
  - (1) Initial low-residue diet to promote healing
  - (2) Avoidance of kernels or seeds that can cause obstruction
  - (3) Increased fluid intake to compensate for losses
- h. Provide emotional support; involve enterostomal therapy nurse; refer to local ostomy organizations

## Evaluation/Outcomes

1. Maintains or regains weight
2. Adheres to dietary regimen

3. Establishes acceptable pattern of soft, formed bowel movements
4. Client or family member demonstrates ability to perform ostomy care
5. Implements strategies to reduce emotional stress

## Intestinal Obstruction

### Data Base

#### A Etiology and pathophysiology

1. Interference with peristaltic movement of intestinal contents because of neurologic or mechanical impairments
2. Causes ([Figure 8-6: Bowel obstructions](#))

**FIGURE 8-6** Bowel obstructions. **A**, Adhesions. **B**, Strangulated inguinal hernia. **C**, Ileocecal intussusception. **D**, Intussusception from polyps. **E**, Mesenteric occlusion. **F**, Neoplasm. **G**, Volvulus of the sigmoid colon. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011.)

- a. Carcinoma of the bowel
- b. Hernias
- c. Fecal impaction
- d. Adhesions (scar tissue forms abnormal connections after surgery, inflammation)
- e. Intussusception (telescoping of bowel on itself)
- f. Volvulus (twisting of intestines)
- g. Paralytic ileus (interference with neural innervation of intestines, resulting in decrease or absence of peristalsis; may be caused by surgical manipulation,

electrolyte imbalance, or infection)

- h. Mesenteric infarction (occlusion of arterial blood supply to bowel leading to necrosis of bowel)

## B Clinical findings

1. Subjective: colicky abdominal pain; constipation that may be accompanied by urge to defecate without results and seepage of fecal liquid
2. Objective: abdominal distention; vomiting that may contain fecal matter; initially increased progressing to decreased or absent bowel sounds; clinical findings of dehydration and electrolyte imbalance; obstipation; flat plate of abdomen shows bowel distended with air

## C Therapeutic interventions

1. Restriction of oral intake; administration of parenteral fluid and electrolytes
2. Surgical intervention: correction of cause (e.g., hernias, adhesions); colostomy, cecostomy, or ileostomy
3. Decompression of GI tract via nasogastric or intestinal tube

# ***Nursing Care of Clients with Intestinal Obstruction***

## **Assessment/Analysis**

1. History to determine risk and causative factors
2. Abdomen for peristaltic waves, distention
3. Presence and characteristics of bowel sounds
4. Pattern and characteristics of bowel elimination

## **Planning/Implementation**

1. Monitor for dehydration and electrolyte imbalances, intake and output
2. Auscultate for bowel sounds; identify passage of flatus
3. Administer meticulous oral hygiene
4. Provide special care associated with an intestinal tube
  - a. After tube reaches stomach, position on right side to facilitate passage of tube through pylorus; then in semi-Fowler position to permit gradual advance into intestines
  - b. Coil and loosely attach extra tubing to client's gown to avoid tension against peristaltic action
  - c. Instill or irrigate with sterile saline every 6 to 8 hours or as ordered to maintain patency
  - d. Assess advancement of tube by identifying markings on tube; record level of advancement; advance (usually 2 to 3 inches every hour) as ordered
  - e. When tube is discontinued, remove gradually because it is being pulled against peristalsis
5. Encourage fluids and foods high in fiber if constipated

## **Evaluation/Outcomes**

1. Establishes a regular pattern of bowel elimination

2. Maintains fluid and electrolyte balance

## Diverticular Disease

### **Data Base**

#### A Etiology and pathophysiology

1. Diverticulosis: multiple pouchlike herniations of intestinal mucosa, as a result of weakness and increased intraabdominal pressure; may be asymptomatic
2. Diverticulitis: inflammation caused by food or feces trapped in a diverticulum; may lead to bleeding, perforation, abscess formation, peritonitis, and bowel obstruction
3. Most commonly occurs in sigmoid colon, but can occur anywhere along GI tract
4. Risk factors: genetic predisposition, inadequate dietary fiber, history of constipation with straining at stool
5. Incidence increases with age

#### B Clinical findings

1. Subjective: cramping, colicky pain in left lower quadrant, nausea, malaise
2. Objective
  - a. Diarrhea or constipation, frank blood in stool, abdominal distention, fever
  - b. Diagnostic tests: CBC reveals leukocytosis; CT scan, abdominal radiograph, and colonoscopy provide direct evidence of disease

#### C Therapeutic interventions

1. Prevention through high-fiber diet; studies demonstrate that intake of seeds, nuts, or popcorn does not increase incidence of disease
2. NPO or clear liquids during acute diverticulitis
3. Pharmacologic management: analgesics; antibiotics (e.g., ciprofloxacin [Cipro], metronidazole [Flagyl], cephalexin [Keflex], doxycycline [Vibramycin]); antispasmodics (e.g., chlordiazepoxide/clidinium [Librax], dicyclomine [Bentyl]); and bulk-forming laxatives and stool softeners
4. Fluid and electrolyte replacement
5. Surgery: hemicolectomy, temporary loop colostomy, or removal of involved bowel for perforation, fistula, abscess or recurrent disease

### **Nursing Care of Clients with Diverticular Disease**

#### **Assessment/Analysis**

1. History of constipation and/or diarrhea with progression of clinical findings
2. Foods that may precipitate acute diverticulitis
3. Stool for consistency and presence of blood
4. Abdomen for distention
5. Presence and extent of bowel sounds

#### **Planning/Implementation**

1. Teach importance of high-fiber and high-fluid intake; foods to avoid to prevent diverticulitis
2. Teach to prevent constipation with dietary bran and prescribed bulk laxatives
3. Maintain NPO and gastric decompression if ordered during acute episode
4. Monitor for clinical findings of peritonitis (e.g., pain, hypotension, abdominal rigidity, abdominal distention, leukocytosis)
5. Administer fluid and electrolyte replacement
6. Teach importance of completing antibiotic regimen
7. Provide care related to bowel surgery (see [Nursing Care under Cancer of the Small Intestine, Colon, or Rectum](#))

## Evaluation/Outcomes

1. States attainment of soft, formed bowel movements
2. Maintains dietary regimen
3. Reports relief from pain
4. Maintains fluid and electrolyte balance

## Cancer of the Small Intestine, Colon, or Rectum

### Data Base

#### A Etiology and pathophysiology

1. Tumor causes narrowing of bowel lumen, ulcerations, necrosis, or perforation
2. Risk factors: familial polyps, aging, chronic ulcerative colitis, bowel stasis, ingestion of food additives, and high-fat, low-fiber diet
3. Cancer of colon is more common in males; incidence increases after 50 years of age
4. Cancer of small intestine is rare; adenocarcinoma of large intestine is more common

#### B Clinical findings ([Figure 8-7: Clinical findings of colorectal cancer by location of primary lesion](#))

1. Subjective: abdominal discomfort or pain, weakness, fatigue
2. Objective
  - a. Alterations in usual bowel function (e.g., constipation or diarrhea, alternating constipation and diarrhea); change in shape of stool (e.g., pencil-shaped, ribbon-shaped)
  - b. Abdominal distention
  - c. Weight loss
  - d. Frank or occult blood in stool; secondary anemia
  - e. Digital examination detects palpable mass
  - f. Proctosigmoidoscopy or colonoscopy allows for direct visualization of bowel and permits biopsy
  - g. Cytologic examination of tissue from GI tract detects malignant cells
  - h. Increased alkaline phosphatase (ALP) and aspartate aminotransferase (AST) levels detect metastasis to liver
  - i. Increased serum carcinoembryonic antigen (CEA) level may indicate carcinoma of colon
- C Therapeutic interventions
  1. Surgical intervention: removes tumor and restores bowel function (e.g., colostomy, hemicolectomy, abdominal perineal resection)
  2. Radiation: reduces size of tumor in nonsurgical situations; may be used preoperatively to reduce size of tumor; may be used postoperatively to limit metastases; may be external or internal (e.g., needles, seeds, wires, catheters)
  3. Chemotherapy: reduces size of tumor and limits metastases; medication may be given for systemic effect or instilled into organ or body cavity
  4. Targeted therapy: cetuximab (Erbix), panitumumab (Vectibix)
  5. Preparation for surgery
    - a. Antibiotics (e.g., neomycin or sulfonamides) to reduce bacteria in bowel
    - b. Type and crossmatch of blood for transfusions to correct anemia
    - c. Vitamin supplements to improve nutritional status
    - d. Gastric or intestinal decompression
    - e. Bowel preparation (e.g., liquid diet, laxatives, enemas)

## ***Nursing Care of Clients with Cancer of the Small Intestine, Colon, or Rectum***

### **Assessment/Analysis**

1. History of clinical findings and risk factors
2. Stool for frequency, color, consistency, shape
3. Weight for baseline data
4. Abdomen for discomfort on palpation

## 5. Presence and extent of bowel sounds

### Planning/Implementation

1. Monitor vital signs, increasing abdominal pain, nausea, and vomiting to detect early clinical findings of complications
2. Monitor patency of gastric or intestinal tube; instill or irrigate with normal saline as ordered; identify amount and character of drainage
3. Implement preoperative bowel preparation and intestinal antisepsis
4. Administer prescribed chemotherapeutic drugs; monitor for significant side effects (e.g., stomatitis, dehydration, nausea, vomiting, diarrhea, leukopenia)
5. Administer electrolyte and parenteral fluid replacement as ordered for bleeding, vomiting, and/or obstruction
6. Provide progressive diet as ordered; assess tolerance
7. Teach dietary modifications to client and family
  - a. Avoid gas-forming foods and stimulants
  - b. Ensure adequate fluid intake
  - c. Eat foods that support the body's natural defense mechanism, particularly nutrient-dense foods (e.g., fruit, vegetables, cereal grains, legumes, lean meat, fish, and poultry)
  - d. Eat a variety of foods that are as close to the presurgical diet as possible
  - e. Take prescribed vitamin and mineral supplements
8. Provide preoperative and postoperative care for colon surgery (see Nursing Care under [Inflammatory Bowel Disease, Ulcerative Colitis](#))
9. Provide care after a colostomy
  - a. Assess client's and family members' reaction to colostomy (depends on how colostomy is viewed, how it affects lifestyle, physical and emotional status, social and cultural background, and place and role in family); stages of grieving may be evident
  - b. Consider that client with a cecostomy or colostomy is especially sensitive to odors and gestures and facial expressions of others
  - c. Assess color of stoma: expected—brick red; inadequate perfusion—gray, pale pink, dark purple
  - d. Teach that colostomy drainage begins in 3 to 4 days; it can be controlled by following a regular irrigation schedule and dietary modifications for colostomy in the distal colon
  - e. Provide colostomy care (see Colostomy Irrigation under [Related Procedures](#)); encourage involvement in colostomy care as soon as physical and emotional status permits
10. Teach need to periodically dilate stoma to prevent strictures
11. Instruct client and family to prevent postoperative infection through meticulous hand hygiene, avoidance of sick individuals and people who recently received pneumonia or influenza vaccinations if possible
12. Teach about resumption of activities to as close as possible to previous lifestyle, including sexual activity; however, contact sports should be avoided
13. Teach need for regular medical supervision; arrange for follow-up care with community agencies as required (e.g., home care programs, American Cancer Society,

ostomy resource person)

## Evaluation/Outcomes

1. Maintains adequate fluid and electrolyte balance
2. Resumes regular pattern of bowel elimination
3. Client or family member demonstrates ability to perform ostomy care
4. Discusses feelings concerning diagnosis, prognosis, and ostomy
5. Maintains nutritional status

## Peritonitis

### Data Base

A Etiology and pathophysiology

1. Inflammation of peritoneum (most commonly caused by *E. coli*)
2. Generally caused by infection from perforation of GI tract, chemical stress, or trauma

B Clinical findings

1. Subjective: abdominal pain, rebound tenderness, malaise, nausea
2. Objective: abdominal muscle rigidity, vomiting, increased temperature and total WBC count, particularly neutrophils

C Therapeutic interventions

1. Bed rest in semi-Fowler position to localize drainage to dependent portion of abdominal cavity
2. Nasogastric decompression until passing flatus
3. Parenteral replacement of fluids and electrolytes; TPN if necessary
4. Antibiotic therapy; analgesics for pain
5. Surgery to correct cause of peritonitis (e.g., appendectomy, incision and drainage of abscesses, closure of perforation)

### Nursing Care of Clients with Peritonitis

### Assessment/Analysis

1. Temperature for baseline data
2. Guarded movements and/or self-splinting
3. Reduction or absence of bowel sounds
4. Presence and characteristics of abdominal pain

### Planning/Implementation

1. Maintain in semi-Fowler position
2. Monitor vital signs, especially temperature
3. Monitor extent and characteristics of pain; administer analgesics as prescribed
4. Monitor IV therapy, GI decompression, and I&O
5. Auscultate for bowel sounds; identify passage of flatus

6. Administer prescribed IV antibiotics

## Evaluation/Outcomes

1. Reports absence of pain
2. Maintains fluid and electrolyte balance
3. Reestablishes regular pattern of bowel elimination

## Hemorrhoids

### **Data Base**

A Etiology and pathophysiology

1. Varicosities of rectum; can be internal or external
2. Risk factors: prolonged sitting or standing, straining at defecation, obesity, and pregnancy

B Clinical findings

1. Subjective: anal pressure, pain and pruritus
2. Objective: protrusion of varicosities around anus, rectal bleeding and mucus discharge

C Therapeutic interventions

1. Low-roughage diet (e.g., elimination of raw fruits and vegetables) during acute exacerbations
2. High-fiber diet during remissions to prevent constipation
3. Stool softeners and bulk cathartics to facilitate passage of stool
4. Analgesic suppositories and ointments; sitz baths or ice compresses for discomfort
5. Surgical intervention: ligation (internal hemorrhoids may be ligated with rubber bands); cryosurgery; laser; sclerotherapy; hemorrhoidectomy

### **Nursing Care of Clients with Hemorrhoids**

## Assessment/Analysis

1. History of causative factors
2. Presence and characteristics of pain/bleeding
3. Presence of hemorrhoids in perianal area

## Planning/Implementation

1. Teach client to
  - a. Promote comfort with sitz baths, ice compresses, local analgesics
  - b. Ensure sufficient private time for defecation, especially after meals
  - c. Increase intake of high-fiber foods
  - d. Drink at least 8 glasses of fluid per day
  - e. Avoid routine use of laxatives, which results in dependency
  - f. Take prescribed bulking agents (e.g., psyllium [Metamucil]) or stool softeners (e.g., docusate sodium [Colace])

- g. Implement regular bowel habits
- 2. Provide care after a hemorrhoidectomy
  - a. Monitor for rectal hemorrhage and urinary retention postoperatively; explain that some bleeding with a bowel movement is expected
  - b. Teach how to administer a retention enema on second or third postoperative day, if ordered, to stimulate defecation and soften stool

## Evaluation/Outcomes

1. Reports increased comfort, particularly on defecation
2. Adheres to treatment regimen
3. Establishes a pattern of regular bowel movements without straining or use of laxatives

## Hernias

### **Data Base**

#### A Etiology and pathophysiology

1. Protrusion of organ or structure through weakening in abdominal wall; may result from congenital or acquired defect; may be precipitated by obesity
2. Reducible: protruding structure can be manipulated back in place
3. Incarcerated: protruding structure cannot be manipulated back in place
4. Strangulated: blood supply to tissues within hernia is disrupted; emergency situation because gangrene occurs
5. Named by location: incisional, umbilical, femoral, inguinal

#### B Clinical findings

1. Subjective: history of swelling after lifting, coughing, or exercising; pain caused by incarceration or strangulation; nausea can accompany strangulation
2. Objective: swelling (lump) in groin or umbilicus, or near an old surgical incision that may subside when in a recumbent position; vomiting and abdominal distention when strangulation occurs

#### C Therapeutic interventions

1. Manual reduction by gently pushing mass back into abdominal cavity
2. Truss (pad worn next to skin held in place under pressure by a belt) may be ordered when client is a poor surgical risk
3. Surgery
  - a. Herniorrhaphy: repair of defect in abdominal musculature or fascia
  - b. Hernioplasty: herniorrhaphy with placement of synthetic mesh, biologic grafts (e.g., human or animal tissue), or biodesign products (e.g., attributes of synthetic mesh and biologic grafts)

### **Nursing Care of Clients with Hernias**

## Assessment/Analysis

1. History of potential causative factors
2. Presence or absence of bowel sounds on auscultation
3. Abdomen while in standing and lying positions to determine if hernia reduces with positional change

## **Planning/Implementation**

1. Avoid abdominal palpation if hernia is strangulated
2. Provide care after surgery
  - a. Instruct to avoid coughing if possible; use deep breathing and incentive spirometry to prevent respiratory complications; encourage self-splinting
  - b. Administer mild cathartics as prescribed to prevent straining, which will increase intraabdominal pressure
  - c. Apply ice bag and scrotal support if scrotum is edematous postoperatively to reduce edema and pain (more common with inguinal hernia)
  - d. Administer analgesic for pain as prescribed
  - e. Instruct to avoid lifting or strenuous exercise on discharge until permitted by health care provider

## **Evaluation/Outcomes**

1. Reports decreased pain
2. Restates discharge instructions
3. Avoids straining on defecation

# CHAPTER 9

# Nursing Care of Clients with Endocrine System Disorders

---

# Overview

## Review of Anatomy and Physiology

### **Function of the Endocrine System**

Endocrine glands continuously secrete products called hormones, which are chemical messengers that deliver stimulatory or inhibitory signals to target cells as a result of a feedback mechanism; once secreted, hormones usually remain present in the body for 4 to 6 hours

### **Structures of the Endocrine System**

(Figure 9-1: Principal endocrine glands)

**FIGURE 9-1** Principal endocrine glands. (From McCance et al: *Pathophysiology: the biological basis for disease in adults and children*, ed 4, St. Louis, 2002, Mosby.)

## Thyroid Gland

A Overlies thyroid cartilage below larynx

B Thyroid hormones: accelerate cellular reactions in most body cells

1. Thyroxine: stimulates metabolic rate; essential for physical and mental development
2. Triiodothyronine: inhibits anterior pituitary secretion of thyroid-stimulating hormone
3. Calcitonin (thyrocalcitonin): decreases loss of calcium from bone; promotes hypocalcemia; action opposite that of parathormone

## Parathyroid Gland

A Small glands (2 to 12) embedded in posterior part of thyroid

B Parathyroid hormone (parathormone)

1. Increases blood calcium concentration
  - a. Breakdown of bone with release of calcium into blood (requires active form of vitamin D)
  - b. Calcium absorption from intestine into blood
  - c. Kidney tubule reabsorption of calcium
2. Decreases blood phosphate concentration by slowing its reabsorption from kidneys, thereby decreasing calcium loss in urine

## Testes and Ovaries

(See [Structures of the Male Reproductive System in Chapter 12](#) and [Female Reproductive System in Chapter 23](#))

## Adrenal Glands

A Two closely associated structures, adrenal medulla and adrenal cortex, positioned at each kidney's superior border

B Adrenal hormones

1. Adrenal medulla: produces two catecholamines, epinephrine and norepinephrine
  - a. Stimulate liver and skeletal muscle to break down glycogen to produce glucose
  - b. Increase oxygen use and carbon dioxide production
  - c. Increase blood concentration of free fatty acids through stimulation of lipolysis in adipose tissue
  - d. Cause constriction of most blood vessels of body, thus increasing total peripheral resistance and arterial pressure to shunt blood to vital organs
  - e. Increase heart rate and force of contraction, thus increasing cardiac output
  - f. Inhibit contractions of gastrointestinal and uterine smooth muscle
  - g. Epinephrine significantly dilates bronchial smooth muscle
2. Adrenal cortex: secretes the mineralocorticoid aldosterone and the glucocorticoids cortisol and corticosterone
  - a. Aldosterone
    - (1) Markedly accelerates sodium and water reabsorption by kidney tubules
    - (2) Markedly accelerates potassium excretion by kidney tubules

(3) Secretion increases as sodium ions decrease or potassium ions increase

b. Cortisol and corticosterone

- (1) Accelerate mobilization and catabolism of tissue protein and fats
- (2) Accelerate liver gluconeogenesis (hyperglycemic effect)
- (3) Decrease antibody formation (immunosuppressive, antiallergic effect)
- (4) Slow proliferation of fibroblasts characteristic of inflammation (antiinflammatory effect)
- (5) Decrease adrenocorticotrophic hormone (ACTH) secretion
- (6) Mildly accelerate sodium and water reabsorption and potassium excretion by kidney tubules
- (7) Increase release of coagulation factors

## Pancreas

A Retroperitoneal in abdominal cavity

B Pancreatic hormones: regulate glucose and protein homeostasis through action of insulin and glucagon

1. Insulin: secreted by beta cells of islets of Langerhans

- a. Promotes cellular uptake of glucose
- b. Stimulates intracellular macromolecular synthesis, such as glycogen synthesis (glyconeogenesis), fat synthesis (lipogenesis), and protein synthesis
- c. Stimulates cellular uptake of sodium and potassium (latter is significant in treatment of diabetic coma with insulin)

2. Glucagon: secreted by alpha cells of islets of Langerhans

- a. Induces liver glycogenolysis; antagonizes glycogen synthesis stimulated by insulin
- b. Inhibits hepatic protein synthesis, which makes amino acids available for gluconeogenesis and increases urea production
- c. Stimulates hepatic ketogenesis and release of glycerol and fatty acids from adipose tissue when cellular glucose level falls

## Thymus Gland

A Located at root of neck and anterior thorax

B Thymic hormone (thymosin)

1. Regulates immunologic processes

2. T lymphocytes produced after birth migrate to lymph nodes and spleen to provide cell-mediated immunity

3. Synthesizes hormones that regulate rate of development of lymphoid cells, particularly T cells

## Pineal Gland

A Located in midbrain attached to third ventricle

B Pineal hormone (melatonin)

1. May regulate diurnal fluctuations of hypothalamic-hypophyseal hormones

2. Inhibits numerous endocrine functions, particularly gonadotropic hormones

## Pituitary Gland

A Located in cranial cavity in sella turcica of sphenoid bone; near optic chiasm

B Anterior lobe (adenohypophysis) and posterior lobe (neurohypophysis)

C Pituitary hormones

1. Hormones secreted by anterior lobe

a. Growth hormone (GH)

(1) Promotes protein anabolism

(2) Promotes fat mobilization and catabolism

(3) Slows carbohydrate metabolism

b. Thyroid-stimulating hormone (TSH): stimulates synthesis and secretion of thyroid hormones

c. ACTH

(1) Stimulates growth of adrenal cortex

(2) Stimulates secretion of glucocorticoids; slightly stimulates mineralocorticoid secretion

d. Follicle-stimulating hormone (FSH)

(1) Stimulates primary graafian follicle to grow and develop

(2) Stimulates follicle cells to secrete estrogen

(3) Stimulates development of seminiferous tubules and spermatogenesis

e. Luteinizing hormone (LH)

(1) Stimulates maturation of follicle and ovum; required for ovulation

(2) Forms corpus luteum in ruptured follicle following ovulation; stimulates corpus luteum to secrete progesterone

(3) In males, LH is called interstitial cell-stimulating hormone (ICSH); stimulates testes to secrete testosterone

f. Prolactin (PRL)

(1) Promotes breast development during pregnancy

(2) Initiates milk production after delivery

(3) Stimulates progesterone secretion by corpus luteum

2. Hormones secreted by posterior lobe

a. Antidiuretic hormone (ADH, vasopressin)

(1) Increases water reabsorption by distal and collecting tubules of kidneys

(2) Stimulates vasoconstriction, raising blood pressure

b. Oxytocin

(1) Stimulates contractions by pregnant uterus

(2) Stimulates milk ejection from alveoli of lactating breasts into ducts

c. Melanocyte-stimulating hormone (MSH): stimulates synthesis and dispersion of melanin in skin, causing darkening

# Antidiabetic Agents

## A Description

1. Used to treat diabetes mellitus
2. Classified into two types: insulin for parenteral use and oral antidiabetics
3. Insulin
  - a. Acts to facilitate transport of glucose and amino acids across cell membrane; promotes glycogenesis and protein synthesis
  - b. Available in three forms: human, pork and beef (no longer available in U.S. because of risk of cow tissue spreading specific infections); human insulin is least antigenic; administered parenterally; brands or forms should not be substituted without medical supervision; nonhuman insulin rarely used since recombinant forms became available
  - c. Insulin administered by syringe, pen, pump, or IV
  - d. Available in rapid-acting, short-acting, intermediate-acting, and long-acting forms; rapid- or short-acting insulin may be premixed with intermediate-acting insulin
4. Oral antidiabetics
  - a. Require some functioning beta cells
  - b. Lower serum glucose level in variety of ways depending on drug

## B Examples

1. Insulin ([Table 9-1: Types of Insulin](#))

---

**Table 9-1**  
**Types of Insulin**

---

Types of Insulin			
Name	Onset	Peak	Duration
<b>Rapid Acting</b>			
lispro (Humalog)	15-30 min	30 min-1½ hours	3-4 hours
aspart (NovoLog)	10-20 min	1-3 hours	3-5 hours
glulisine (Apidra)	15-30 min	30 min-1½ hours	3-4 hours
<b>Short Acting</b>			
regular (Novolin R)	30 min-1 hour	2-5 hours	5-8 hours
regular (Humulin R)	30 min-1 hour	1-5 hours	6-10 hours
<b>Intermediate Acting</b>			
NPH (N) (Novolin N) (Humulin N)	1½-4 hours	4-12 hours	18-24 hours
<b>Long Acting</b>			
glargine (Lantus)	1-1½ hours	No peak—steadily delivered	20-24 hours
detemir (Levemir)	0.8-2 hours	unknown	24 hours
<b>Premixed</b>			
Novolin 70/30	30 min	2-12 hours	24 hours
Humulin 70/30	30 min	2-4 hours	14-24 hours
NovoLog Mix 70/30	10-20 min	1-4 hours	24 hours
Humulin 50/50	30 min	2-5 hours	18-24 hours
Humalog 75/25	15 min	30 min-2.5 hours	16-20 hours

## 2. Oral antidiabetics (hypoglycemics)

- Sulfonylureas: stimulate beta cells to produce insulin; second-generation sulfonylureas: glipiZIDE (Glucotrol), glyBURIDE, glimepiride (Amaryl)
- Biguanides: reduce the rate of endogenous glucose production by liver; increase the use of glucose by muscle and fat cells; metformin (Glucophage)
- Thiazolidinediones: improve insulin sensitivity, thus improving peripheral glucose uptake; rosiglitazone (Avandia), pioglitazone (Actos)
- Meglitinides: stimulate quick release of insulin by beta cells; repaglinide (Prandin), nateglinide (Starlix)
- Alpha-glucosidase inhibitors: block digestion of ingested carbohydrates and slow absorption of glucose; acarbose (Precose), miglitol (Glyset)

- f. Dipeptidyl peptidase 4 (DPP-4) inhibitor: prevents breakdown of glucagon-like peptide-1 (GLP-1) which reduces blood glucose levels in the body; sitagliptin (Januvia), saxagliptin (Onglyza)
- g. Synthetic analog of human amylin: decreases gastric emptying; pramlintide (Symlin)
- h. Incretin mimetic: stimulates insulin production in type 2 diabetes; exenatide (Byetta), liraglutide (Victoza); injectable medications for type 2 diabetes
- i. Combination: glyBURIDE/metformin (Glucovance); sitagliptin/metformin (Janumet); pioglitazone/metformin (Actoplus Met)

#### C Major side effects

1. Parenteral insulin: hypoglycemia (e.g., irritability, tachycardia, hunger, moist skin, tremor, headache, confusion, seizures); lipodystrophy (incidence decreased dramatically since advent of human recombinant insulin)
2. Inhalation insulin: cough, dry mouth, chest discomfort
3. Oral antidiabetics: hypoglycemia; skin rash, allergic reactions, pruritus (hypersensitivity); jaundice (hepatic alterations); thrombocytopenia; lactic acidosis; vitamin B<sub>12</sub> deficiency
  - a. Metformin (Glucophage): not recommended for clients diagnosed with heart failure
  - b. Acarbose (Precose), miglitol (Glyset): bloating, gas pains, and diarrhea
  - c. Rosiglitazone (Avandia): hepatotoxicity, increased risk of fractures

#### D Nursing care

1. Assess clients for clinical findings of hypoglycemia and side effects of medications
2. Instruct client to
  - a. Use proper medication administration procedure
  - b. Adhere to dietary program, including snacks
  - c. Avoid alcohol, especially when taking metformin (Glucophage)
  - d. Perform self-monitoring of blood glucose (SMBG) levels
  - e. Carry medical alert card
  - f. Be prepared for hypoglycemic incidents; administer rapid-acting glucose (e.g., glucose gel or tablets) followed by complex carbohydrate and protein (e.g., cheese and crackers) to stabilize blood glucose level
  - g. Ensure regular laboratory testing (e.g., blood glucose, glycosylated hemoglobin [glycohemoglobin, Hb A<sub>1c</sub>], liver enzymes)
3. Administer insulin
  - a. Administer all insulin subcutaneously because insulin is destroyed by gastric juices if taken by mouth; rapid-acting insulins can be used in continuous subcutaneous (Sub-Q) insulin infusion devices
  - b. Use regular insulin or glulisine (Apidra) for IV administration
  - c. If premixed insulin is not prescribed and two forms are to be mixed, draw up rapid- or short-acting insulin first so as not to accidentally dilute the vial with NPH insulin; peakless basal insulin cannot be mixed with other insulins because it causes precipitation

- d. Rotation of sites not necessary with recombinant insulin; abdomen is preferred site because absorption is not influenced by exercise
- e. Dosage adjustment is necessary when taking nothing by mouth (NPO) and when ill

- 4. Offer emotional support; therapy is lifelong
- 5. Metformin (Glucophage): withhold drug before and 48 hours after diagnostic studies requiring iodinated contrast media; increased risk of hypoglycemia when given concurrently with allopurinol (Zyloprim)
- 6. Instruct to prevent complications of hyperglycemia with frequent glucose monitoring and multiple daily injections of insulin as needed

## **Thyroid Enhancers**

### A Description

- 1. Regulate metabolic rate of body cells; aid in growth and development of bones and teeth; affect protein, fat, and carbohydrate metabolism
- 2. Replace thyroid hormone when there is a reduction in or absence of thyroid gland function
- 3. Available in oral and parenteral (IV) preparations

B Examples: levothyroxine (Synthroid) is drug of choice; liothyronine (Cytomel); liotrix (Thyrolar)

C Major side effects: increased metabolism (increased serum triiodothyronine [ $T_3$ ], thyroxine [ $T_4$ ]); hyperactivity (increased metabolic rate); cardiac stimulation (increased cardiac metabolism)

### D Nursing care

- 1. Instruct client to
  - a. Report occurrence of side effects immediately
  - b. Take medication as scheduled at same time daily; do not stop abruptly
  - c. Take pulse rate; notify health care provider if greater than 100 beats/min
  - d. Carry medical alert card
  - e. Continue routine medical supervision
- 2. Assess for potentiation of anticoagulant effect
- 3. Offer emotional support; therapy usually is lifelong
- 4. Assess for clinical findings of hyperthyroidism

## **Thyroid Inhibitors**

### A Description

- 1. Interfere with synthesis and release of thyroid hormone; inhibit oxidation of iodides to prevent their combination with tyrosine in formation of thyroxine
- 2. Treat hyperthyroidism
- 3. Available in oral and parenteral (IV) preparations

B Examples: methimazole (Tapazole); propylthiouracil (PTU)

C Antithyroid medications such as iodine (e.g., potassium iodide, SSKI) to reduce

vascularity of thyroid gland

D Major side effects: agranulocytosis (decreased white blood cells [WBCs]); skin disturbances (hypersensitivity); nausea, vomiting (irritation of gastric mucosa); decreased metabolism (decreased production of serum  $T_3$ ,  $T_4$ ); iodine—bitter taste, stains teeth (local oral effect on mucosa and teeth)

E Nursing care

1. Instruct client to
  - a. Report side effects, especially sore throat, jaundice, and fever
  - b. Avoid crowded places and potentially infectious situations
2. Administer liquid iodine preparations diluted in a beverage; use straw to avoid staining teeth
3. Assess for clinical findings of hypothyroidism

## **Adrenocorticoids**

A Description

1. Interfere with release of factors important in producing inflammatory and immune responses (immunosuppression)
2. Remove fluid accumulation from brain, thereby decreasing cerebral edema
3. Increase glucose and fat formation and promote protein breakdown
4. Used for hormonal replacement therapy
5. Available in oral, parenteral (intramuscular [IM], IV), inhalation, intraarticular, and topical (including ophthalmic) preparations

B Examples

1. Glucocorticoids
  - a. Long-acting: dexamethasone
  - b. Intermediate-acting: methylPREDNISolone (Medrol, Solu-Medrol)
  - c. Short-acting: hydrocortisone (Solu-Cortef)
2. Mineralocorticoids: fludrocortisone

C Major side effects

1. Cushingoid clinical findings (increased glucocorticoid activity causing facial edema, fluid retention)
2. Hypertension (sodium and water retention)
3. Hyperglycemia (increased carbohydrate catabolism; gluconeogenesis)
4. Mood changes (central nervous system [CNS] effect)
5. Gastrointestinal (GI) irritation and ulcer formation (local GI effect)
6. Cataracts (hyperglycemia)
7. Hypokalemia (potassium excretion)
8. Decreased wound healing; leukopenia
9. Osteoporosis
10. Derivatives with 17-ketosteroid properties: masculinization in females

D Nursing care

1. Administer oral preparations with food, milk, or antacid
2. Monitor weight, blood pressure, and serum electrolytes

3. Assess for GI bleeding
4. Monitor blood glucose level in people with diabetes
5. Instruct client to
  - a. Avoid exposure to infections; notify health care provider if fever or sore throat occurs; avoid immunizations during therapy
  - b. Avoid using salt; encourage foods high in potassium
  - c. Take medications only as directed, and explain why; avoid missing, changing, or withdrawing drug suddenly
  - d. Avoid nonsteroidal antiinflammatory drugs (NSAIDs) and over-the-counter (OTC) medications
  - e. Carry medical alert card
6. Withdraw drug therapy gradually to permit adrenal recovery

## ***Antidiuretic Hormone***

### A Description

1. Promotes water reabsorption by distal renal tubules and causes vasoconstriction and increased muscle tone of bladder, GI tract, uterus, and blood vessels
2. Treatment for diabetes insipidus

### B Example: desmopressin (DDAVP)

### C Major side effects

1. Transient headache, drowsiness, listlessness (CNS effect)
2. Nausea, heartburn, mild abdominal cramps (GI irritation)
3. Nasal irritation, congestion, rhinitis
4. Shortness of breath, facial flushing, pain and swelling at injection site

### D Nursing care

1. Monitor intake and output (I&O) and electrolytes
2. Assess for side effects

# Major Disorders of the Endocrine System

## Hyperpituitarism

### **Data Base**

#### A Etiology and pathophysiology

1. Excessive concentration of pituitary hormones (e.g., GH, ACTH, PRL) in the blood, glandular over activity, an adenoma, or changes in the anterior lobe of the pituitary gland
2. Classification of GH overproduction
  - a. Gigantism: generalized increase in size, especially in children; involves long bones
  - b. Acromegaly: occurs after epiphyseal closing, with subsequent enlargement of cartilage, bone, and soft tissues of body
3. Cushing syndrome: overproduction of ACTH

#### B Clinical findings

1. Subjective: headaches, depression, weakness
2. Objective
  - a. Increased soft tissue and bone thickness
  - b. Facial features become coarse and heavy, with enlargement of lower jaw, lips, and tongue
  - c. Enlarged hands and feet
  - d. Increased GH, ACTH, or PRL
  - e. X-ray examination of long bones, skull (sella turcica area), and jaw demonstrates change in structure
  - f. Amenorrhea
  - g. Clinical findings of increased intracranial pressure (e.g., vomiting, papilledema, focal neurologic deficits)
  - h. Diabetes and hyperthyroidism may result

#### C Therapeutic interventions

1. Medications
  - a. Somatostatin analog: octreotide (Sandostatin)
  - b. Dopamine agonist: bromocriptine (Parlodel)
  - c. Pegvisomant (Somavert)
  - d. Medications to relieve clinical findings of other endocrine imbalances resulting from pituitary hyperfunction
2. Surgical intervention: hypophysectomy
3. Irradiation of pituitary gland

### **Nursing Care of Clients with Hyperpituitarism**

### **Assessment/Analysis**

1. Changes in energy level, sexual function, and menstrual patterns; signs of increased

intracranial pressure

2. Face, hands, and feet for thickening, enlargement; changes in the size of hat, gloves, rings, or shoes
3. Dysphagia or voice changes
4. Presence of hypogonadism as a result of hyperprolactinemia
5. Reaction to changes in physical appearance and sexual function

## Planning/Implementation

1. Help to accept altered body image that is irreversible
2. Assist family to understand what client is experiencing
3. Help to recognize that the need for medical supervision will be life-long
4. Help to understand the basis for the change in sexual functioning
5. Encourage to express feelings
6. Teach self-care after a hypophysectomy
  - a. Encourage to follow the established medical regimen, particularly hormone replacement
  - b. Limit stressful situations
  - c. Protect self from infection
7. Provide care after intracranial surgery
  - a. Perform neurologic assessments; monitor for increased intracranial pressure
  - b. Monitor I&O and daily weight to identify complication of diabetes insipidus
  - c. Assess clear nasal drainage for glucose to determine presence of cerebrospinal fluid (CSF); CSF will test positive for glucose
  - d. Encourage deep breathing, but not coughing
  - e. Institute measures to prevent constipation because straining increases intracranial pressure
  - f. Maintain in no lower than semi-Fowler position

## Evaluation/Outcomes

1. Verbalizes an improved body image
2. Reports satisfying sexual functioning
3. Continues medical regimen and supervision

## Hypopituitarism

### Data Base

A Etiology and pathophysiology

1. Deficiency of one or more anterior pituitary hormones
  2. Total absence of pituitary hormones referred to as panhypopituitarism (Simmonds disease)
  3. Occurs with destruction of anterior lobe of pituitary by trauma, tumor, or hemorrhage
- B Clinical findings (vary with target organs affected)

1. Subjective: lethargy; loss of strength and libido; decreased tolerance for cold
2. Objective
  - a. Decreased temperature
  - b. Postural hypotension
  - c. Hypoglycemia
  - d. Decreased levels of GH, ACTH, TSH, FSH, and LH
  - e. Sterility; loss of secondary sexual characteristics
  - f. Visual disturbances if tumor impinges on optic nerve

#### C Therapeutic interventions

1. Hormone replacement
2. Surgery if tumor is present

## ***Nursing Care of Clients with Hypopituitarism***

### **Assessment/Analysis**

1. Baseline vital signs
2. Sexuality (e.g., loss of libido; painful intercourse; inability to maintain an erection)
3. Past and present menstrual patterns
4. Visual acuity
5. Loss of secondary sexual characteristics
6. Activity tolerance

### **Planning/Implementation**

1. Monitor effects of hormone replacement therapy
2. Discuss importance of adhering to medical regimen on long-term basis
3. Allow ample time to verbalize feelings regarding long-term nature of disease and impact on quality of daily life
4. Provide adequate rest periods

### **Evaluation/Outcomes**

1. Adheres to medical regimen
2. Expresses positive feelings of body image
3. Establishes satisfying sexual functioning

## **Diabetes Insipidus**

### ***Data Base***

#### A Etiology and pathophysiology

1. Deficient antidiuretic hormone (ADH) by posterior pituitary gland, decreasing reabsorption of water in nephron tubules; may be familial, idiopathic, or secondary to trauma, surgery, tumors, infections, or autoimmune disorders
2. Neurogenic diabetes insipidus: renal tubular defect resulting in decreased water

absorption; results in impaired renal concentrating ability; may be familial or result from renal disorders, primary aldosteronism, or excessive water intake (primary polydipsia)

## B Clinical findings

1. Subjective: polydipsia, craving for cold water
2. Objective
  - a. Polyuria (5 to 25 L/24 hr); polydipsia
  - b. Dilute urine; specific gravity 1.001 to 1.005 or less; osmolality 50 to 200 mOsm/kg
  - c. Increased serum sodium level and plasma osmolality
  - d. Clinical findings of dehydration (e.g., poor skin turgor, dry mucous membranes, elevated temperature, hypotension) because of excessive water loss

## C Therapeutic interventions

1. Promote reabsorption of water by action on renal tubular epithelium: desmopressin (DDAVP, Stimate)
2. Potentiate available antidiuretic hormone secretion: chlorPROPAMIDE (Diabinese)
3. Antidiuretic effect: carbamazepine (Carbatrol, Tegretol); unlabeled use
4. Treatment of underlying cause
5. Hypophysectomy

## ***Nursing Care of Clients with Diabetes Insipidus***

### **Assessment/Analysis**

1. Intake and output, weight, urine, specific gravity, and urine and serum osmolality to establish baseline data
2. Serum electrolyte levels
3. Dryness of skin and mucous membranes

### **Planning/Implementation**

1. Monitor fluid and electrolyte status (e.g., intake and output, daily weight, skin turgor, electrolyte levels)
2. Replace fluids as ordered
3. Monitor response to ADH replacement
4. Instruct client
  - a. Ensure long-term medical supervision
  - b. Obtain weight daily
  - c. Wear medical alert bracelet
  - d. Monitor for signs of polyuria; water retention and hyponatremia (overdosage of ADH medication may cause syndrome of inappropriate antidiuretic hormone [SIADH])
  - e. Avoid alcohol because it suppresses ADH secretion
  - f. Encourage oral fluids
  - g. Monitor urine specific gravity

## Evaluation/Outcomes

1. Maintains fluid balance
2. States clinical findings if overmedication or undermedication with ADH replacement occurs

## Syndrome of Inappropriate Antidiuretic Hormone Secretion

### **Data Base**

#### A Etiology and pathophysiology

1. Excessive ADH secretion leads to fluid retention and dilutional hyponatremia
2. Caused by head trauma, tumors, or infection; malignant tumor cells may produce ADH

#### B Clinical findings

1. Subjective: anorexia, nausea, fatigue, headache
2. Objective
  - a. Reduced urine output; hyponatremia
  - b. Decreased deep tendon reflexes
  - c. Change in mental status, muscle twitching, seizures, coma
  - d. Clinical findings of fluid retention/fluid overload (e.g., weight gain, jugular vein distention, crackles on auscultation of lung, amber urine)
  - e. Decreased serum sodium level and osmolality

#### C Therapeutic interventions

1. Fluid restriction; hypertonic parenteral fluids
2. Vasopressin receptor antagonists: conivaptan (Vaprisol), and tolvaptan (Samsca) for treatment of euvoletic-hyponatremia; administered only in hospital environment; used cautiously with clients with alcoholism and/or malnutrition
3. Treatment of symptoms (e.g., seizures, dysrhythmias)

### **Nursing Care of Clients with Syndrome of Inappropriate Antidiuretic Hormone Secretion**

## Assessment/Analysis

1. History of malignancy, infection, or increased intracranial pressure
2. I&O, daily weight, vital signs
3. Serum and urine for sodium concentration and osmolality
4. Neurologic evaluations

## Planning/Implementation

1. Monitor fluid and electrolyte status; weigh daily
2. Monitor for altered level of consciousness
3. Restrict fluid intake; administer hypertonic intravenous solutions (usually 3% sodium chloride) as ordered

4. Institute seizure precautions and protect from injury
5. Provide supportive measures for related disorders

## Evaluation/Outcomes

1. Maintains fluid balance
2. Remains seizure-free

## Hyperthyroidism (Graves Disease, Thyrotoxicosis)

### Data Base

#### A Etiology and pathophysiology

1. Excessive concentration of thyroid hormones in blood as result of thyroid disease or increased levels of TSH; leads to hypermetabolic state
2. Autoimmune process of impaired regulation; mediated by immunoglobulin G (IgG) antibody that activates TSH receptors on surface of thyroid cells; associated with other autoimmune disorders
3. Gland may enlarge (goiter) as a result of decreased iodine intake; there may or may not be an increase in secretion of thyroid hormones
4. Hypothyroidism may result from therapy (e.g., radioactive iodine, thyroidectomy); treated with levothyroxine (Synthroid)

#### B Clinical findings

1. Subjective: polyphagia, emotional lability, apprehension, heat intolerance
2. Objective
  - a. Weight loss, loose stools, tremors, hyperactive reflexes, restlessness, diaphoresis, insomnia, exophthalmos, corneal ulceration, increased systolic blood pressure, temperature, pulse rate, and respiration
  - b. Decreased TSH levels if thyroid disorder; increased TSH levels if secondary to a pituitary disorder
  - c. Graves disease generally involves hyperthyroidism, goiter, and exophthalmos
  - d. Increased  $T_3$ ,  $T_4$ , radioactive iodine uptake (RAI) test, long-acting thyroid stimulator (LATS)
  - e. Thyrotoxic crisis (thyroid storm): hypermetabolism that may lead to heart failure; usually precipitated by a severe physiologic or psychologic stress (e.g., manipulation of gland during thyroid surgery, radioactive iodine therapy) that releases thyroid hormone into bloodstream

#### C Therapeutic interventions

1. Antithyroid medications: propylthiouracil (PTU), methimazole (Tapazole); block synthesis of thyroid hormone
2. Antithyroid medications: iodine (potassium iodide, SSKI); reduce vascularity of thyroid gland
3. Radioactive iodine:  $^{131}\text{I}$  (atomic cocktail); destroys thyroid gland cells, thereby decreasing production of thyroid hormone

4. Medications to relieve clinical findings related to increased metabolic rate: adrenergic blocking agents
5. Graves' ophthalmopathy: prednisone to reduce inflammation behind the eye
6. Well-balanced, high-calorie diet with vitamin and mineral supplements
7. Surgical intervention: subtotal or total thyroidectomy; orbital decompression to reduce abnormal protrusion of the eyeball (exophthalmos); various procedures to correct vision or protect eye

## ***Nursing Care of Clients with Hyperthyroidism***

### **Assessment/Analysis**

1. History of weight loss, diarrhea, insomnia, emotional lability, palpitations, heat intolerance
2. Eyes for exophthalmos, tearing, sensitivity to light (photophobia)
3. Neck palpation for enlarged thyroid gland
4. Weight and vital signs to establish baseline

### **Planning/Implementation**

1. Establish climate for uninterrupted rest (e.g., decreased stimulation, back rub, prescribed medications); provide relaxing, calm environment
2. Protect from stress-producing situations
3. Keep room cool
4. Provide diet high in calories, proteins, and carbohydrates with supplemental feedings between meals and at bedtime; vitamin and mineral supplements as prescribed
5. Understand that client is upset by lability of mood and exaggerated response to environmental stimuli; explain disease processes involved; avoid rushing and surprises; prepare client for procedures
6. Protect eyes (e.g., eye drops, patches, tinted eyeglasses, elevation of head of bed, cool compresses to eyes)
7. Provide care before thyroidectomy
  - a. Teach importance of taking prescribed antithyroid medications to achieve euthyroid state
  - b. Teach deep-breathing exercises and use of hands to support neck to avoid strain on suture line after surgery
8. Provide care after thyroidectomy
  - a. Observe for clinical findings of respiratory distress and laryngeal stridor caused by tracheal edema; explain a sore throat when swallowing is expected; keep tracheotomy set available
  - b. Assess for hoarseness which may result from endotracheal intubation or laryngeal nerve damage
  - c. Maintain in semi-Fowler position to reduce edema at surgical site
  - d. Observe for hemorrhage at operative site and back of neck and shoulders

- e. Observe for thyrotoxicosis (e.g., high temperature, tachycardia, irritability, delirium, coma)
- f. Notify health care provider immediately if clinical findings of thyrotoxicosis occur; administer propranolol (Inderal), iodine, propylthiouracil (PTU), and steroids as prescribed
- g. Observe for signs of tetany (e.g., numbness or twitching of extremities, spasm of glottis, positive Chvostek and Trousseau signs) because hypocalcemia can occur after accidental trauma or removal of parathyroid glands; give calcium gluconate or calcium chloride (IV) as prescribed if tetany occurs
- 9. Teach regarding radioactive iodine therapy
  - a. Client is mildly radioactive and should follow radiation precautions as advised (usually 7 days)
    - (1) Increase clear fluid intake
    - (2) Void hourly during first 8 to 12 hours
    - (3) Flush toilet twice after use
    - (4) Ensure thorough hand hygiene
    - (5) Avoid contact with children; avoid close prolonged contact or sleeping with another person
    - (6) Do not share dishes, utensils, food, or drink with another; avoid kissing and sexual contact until permitted
  - b. Hospitalization in isolation may be required for several days if larger dose is used
  - c. Clinical findings of hyperthyroidism may take 3 to 4 weeks to subside
- 10. Teach importance of taking antithyroid medications regularly and to observe for adverse effects
  - a. Hypothyroidism as result of treatment
  - b. Hyperthyroidism as result of thyrotoxicosis or overmedication with thyroid hormone replacement therapy
- 11. Instruct client to comply with periodic  $T_3$ ,  $T_4$ , TSH studies to monitor hormone levels

## Evaluation/Outcomes

- 1. Maintains ideal body weight
- 2. Establishes regular routine of activity and rest

## Hypothyroidism

### Data Base

#### A Etiology and pathophysiology

- 1. Deficient hormone synthesis
- 2. Congenital thyroid defects
- 3. Prenatal and postnatal iodine deficiency
- 4. Autoimmune diseases (e.g., Hashimoto disease, sarcoidosis)
- 5. Classified according to time of life when it occurs

- a. Cretinism: hypothyroidism found at birth
  - b. Lymphocytic thyroiditis: most often after 6 years of age and peaks during adolescence; generally self-limiting
  - c. Hypothyroidism without myxedema: mild degree of thyroid failure in older children and adults; more common as one ages
  - d. Hypothyroidism with myxedema: severe degree of thyroid failure in older individuals
6. Decreased levels of thyroid hormones ( $T_3$  and  $T_4$ ) slow basal metabolic rate (BMR); decreased BMR affects lipid metabolism, increases cholesterol and triglyceride levels, and affects RBC production, leading to anemia and folate deficiency
7. Myxedema coma is most severe degree of hypothyroidism; exhibited by hypothermia, bradycardia, hypoventilation, progressive loss of consciousness; precipitated by severe physiologic stress; potentially fatal endocrine emergency

#### B Clinical findings

1. Subjective: dull mental processes, apathy, lethargy, loss of libido, intolerance to cold, anorexia
2. Objective
  - a. Lack of facial expression; weight gain; constipation; subnormal temperature and pulse rate; dry, brittle hair and nails; pale, dry, coarse skin; enlarged tongue; drooling; hoarseness; thinning of lateral eyebrows; loss of scalp, axilla, and pubic hair; diminished hearing; anemia; periorbital edema
  - b. Decreased  $T_3$  and  $T_4$  levels
  - c. TSH stimulation test: increased in primary hypothyroidism; delayed or poor response with secondary hypothyroidism
  - d. Decreased BMR and radioactive iodine uptake

#### C Therapeutic interventions

1. Thyroid hormones: levothyroxine (Synthroid); liothyronine (Cytomel); liotrix (Thyrolar)
2. Maintenance of vital functions
3. Screening every 5 years after age 35 for thyroid hormone status

## ***Nursing Care of Clients with Hypothyroidism***

### **Assessment/Analysis**

1. History that may have contributed to condition
2. Activity tolerance, bowel elimination, sleeping patterns, sexual function, and intolerance to cold
3. Skin and hair for characteristic changes
4. Weight and vital signs to establish baseline
5. Clinical findings of anemia, atherosclerosis, or arthritis

### **Planning/Implementation**

1. Have patience with lethargic client

2. Explain that activity tolerance and mental functioning will improve with therapy; explain importance of continued hormone replacement throughout life
3. Review clinical findings of hypothyroidism and hyperthyroidism to help client identify clinical findings of undermedication or overmedication
4. Instruct client
  - a. Avoid OTC drugs unless approved by health care provider; have medical supervision when taking opioid analgesics and tranquilizers
  - b. Modify outdoor activities in cold weather; wear adequate clothing because of sensitivity to cold environments
  - c. Use moisturizers for dry skin
  - d. Restrict calories, cholesterol, and fat in diet to prevent weight gain
  - e. Avoid constipation (e.g., increase fluid intake and fiber in diet)
5. Teach to seek medical supervision regularly and when clinical findings of illness develop; teach client and family clinical findings of complications
  - a. Angina pectoris: chest pain, indigestion
  - b. Cardiac failure: dyspnea, palpitations
  - c. Myxedema coma: weakness, syncope, slow pulse rate, subnormal temperature, slow respirations, lethargy

## Evaluation/Outcomes

1. Completes activities of daily living (ADLs) without fatigue
2. Adheres to dietary, exercise, and medication regimen
3. Establishes regular pattern of bowel elimination

## Hyperparathyroidism

### **Data Base**

#### A Etiology and pathophysiology

1. Hyperfunction of parathyroid glands; usually caused by adenoma; hypertrophy and hyperplasia of glands
2. Increased reabsorption of calcium and excretion of phosphorus by kidneys
3. Demineralization of bone occurs if dietary intake is not enough to meet calcium levels demanded by high levels of parathormone

#### B Clinical findings

1. Subjective: apathy, fatigue, muscular weakness, anorexia, nausea, emotional irritability, deep bone pain (if demineralization occurs), backache
2. Objective
  - a. Bone cysts, pathologic fractures
  - b. Renal damage, pyelonephritis, polyuria, renal calculi composed of calcium
  - c. Vomiting, constipation
  - d. Cardiac dysrhythmias
  - e. Increased serum calcium and parathormone levels; decreased serum phosphorus

level

#### C Therapeutic interventions

1. Surgical excision of parathyroid tumor
2. Restriction of dietary calcium intake
3. Furosemide (Lasix) to increase renal excretion of calcium
4. Pharmacology to decrease calcium level: gallium (Ganite), calcitonin (Miacalcin)
5. Calcimimetics: cinacalcet (Sensipar) tricks parathyroid glands into releasing less parathyroid hormone
6. Hormone replacement therapy for postmenopausal women with osteoporosis; may help bones retain calcium
7. Bisphosphonates: alendronate (Fosamax), ibandronate (Boniva), risedronate (Actonel) help prevent loss of calcium from bones
8. After parathyroidectomy for parathyroid hyperplasia: autotransplant of a segment of parathyroid gland is placed in forearm or neck to prevent hypoparathyroidism

### ***Nursing Care of Clients with Hyperparathyroidism***

#### **Assessment/Analysis**

1. GI disturbance or bone pain
2. History of renal calculi or fractures
3. Clinical findings of renal calculi (e.g., hematuria, flank pain)
4. Use of thiazide diuretics or vitamin D, which can increase serum calcium level
5. Serum calcium and phosphorus levels
6. Baseline vital signs, particularly heart rate and rhythm

#### **Planning/Implementation**

1. Strain urine for calculi
2. Encourage fluid intake
3. Assist with ambulation because weight-bearing helps prevent demineralization of bone
4. Monitor I&O
5. Instruct client
  - a. Avoid high impact activities to prevent fractures
  - b. Encourage foods with fiber to limit constipation
  - c. Limit intake of foods high in calcium, especially milk products
6. Provide cardiac monitoring if hypercalcemia is severe
7. Provide care after a parathyroidectomy: same nursing care as care after a thyroidectomy (see [Nursing Care under Hyperthyroidism](#))

#### **Evaluation/Outcomes**

1. Maintains skeletal integrity
2. Remains free of urinary complications

# Hypoparathyroidism

## **Data Base**

### A Etiology and pathophysiology

1. Insufficient amount of parathormone after thyroid surgery, parathyroid surgery, or radiation therapy of neck; idiopathic hypoparathyroidism is rare
2. As level of parathormone drops, serum calcium level also drops, causing clinical findings of tetany; concomitant rise in serum phosphate level occurs

### B Clinical findings

1. Subjective: photophobia, muscle cramps, irritability, dyspnea, tingling of extremities
2. Objective
  - a. Trousseau sign: carpopedal spasm
  - b. Chvostek sign: contraction of the facial muscle in response to tapping near the angle of the jaw
  - c. Decreased serum calcium and parathormone levels; elevated serum phosphate level
  - d. Stridor and wheezing from laryngeal spasm; tremors; seizures
  - e. X-ray examination reveals increased bone density
  - f. Cardiac dysrhythmias, alkalosis, cataracts if disease is chronic

### C Therapeutic interventions

1. Calcium chloride or calcium gluconate given IV for emergency treatment of overt tetany
2. Calcium salts administered orally: calcium carbonate (TUMS, Cal-Plus, Caltrate, Os-Cal 500), calcium gluconate (Kalcinate); calcium citrate (Citracal, Cal-Citrate 250)
3. Vitamin D: dihydrotachysterol (Hytakerol), ergocalciferol (Calciferol) to increase absorption of calcium from the GI tract
4. Parathormone injections
5. High-calcium, low-phosphate diet
6. Aluminum hydroxide to decrease absorption of phosphorus from the GI tract

## **Nursing Care of Clients with Hypoparathyroidism**

### **Assessment/Analysis**

1. History of muscle spasms, numbness or tingling of extremities, visual disturbances, or seizures
2. Neuromuscular irritability
3. Status of respiratory functioning
4. Heart rate and rhythm
5. Serum calcium and phosphate levels

### **Planning/Implementation**

1. Observe for respiratory distress; have emergency equipment available for

tracheostomy and mechanical ventilation

2. Maintain seizure precautions

3. Reduce environmental stimuli

4. Provide dietary instruction (e.g., elimination of milk, cheese, and egg yolks because of high phosphorus content; encourage inclusion of dietary sources of calcium that are low in phosphorus)

5. Teach clinical findings of hypocalcemia and hypercalcemia; instruct to contact health care provider immediately if either occurs

## Evaluation/Outcomes

1. Remains free from neuromuscular irritability

2. Maintains respiratory functioning within acceptable limits

## Diabetes Mellitus

### Data Base

A Etiology and pathophysiology

1. Hyperglycemia occurs with insufficient secretion of insulin, peripheral cells become insulin-resistant, and/or hepatic glucose production is increased

2. Body attempts to excrete excess glucose via kidneys; osmotic force is created because of excess glucose in urine, resulting in polyuria

3. If body is unable to use carbohydrates for cellular function fat is oxidized as an energy source; oxidation of fats produces ketone bodies

4. Risk factors

a. Type 1: genetic predisposition; environmental factors (e.g., toxins, viruses); age younger than 30 years

b. Type 2: family history, obesity, usually age 45 years or older, history of gestational diabetes, increasing incidence in childhood and adolescence

5. Classification

a. Type 1: formerly known as insulin-dependent diabetes mellitus (IDDM); destruction of beta cells leads to inability to produce insulin; requires exogenous insulin

b. Type 2: formerly known as non-insulin-dependent diabetes mellitus (NIDDM); has gradual onset and pancreas produces some insulin so that ketoacidosis is unlikely; may be controlled with adherence to diet and exercise program that promotes maintenance of desirable weight; accounts for 90% of diabetes

c. Gestational: detected during 24 to 28 weeks' gestation; glucose levels generally are normal 6 weeks postpartum; more likely to develop type 2 diabetes 5 to 10 years after birth of fetus; neonate exhibits macrosomia, hypoglycemia, hypocalcemia, and hyperbilirubinemia (see [Diabetes Mellitus in Chapter 26](#))

d. Diabetes mellitus associated with other conditions or syndromes (formerly known as secondary diabetes): associated with glucocorticoid medication and conditions

such as Cushing syndrome and pancreatic disease

- e. Impaired glucose tolerance: high glucose levels but not sufficiently high to be diagnostic for diabetes; prediabetes — fasting serum glucose level of 100 to 125 mg/dL

6. Acute increases in serum glucose levels: diabetic ketoacidosis (DKA) and hyperglycemic hyperosmolar nonketotic syndrome (HHNS) constitute medical emergencies

- a. Causes: insufficient insulin, major stresses (e.g., infection, surgery, trauma, pregnancy, emotional turmoil, nausea and vomiting); drugs (steroids); glucose load

- b. Pathophysiology

- (1) DKA is associated with type 1; with inadequate insulin to support basal needs, proteins and fats are used for energy; ketones are excreted via urine and breathing; dehydration and electrolyte imbalances occur; serum glucose level 300 to 600 mg/dL

- (2) HHNS is associated with type 2; hyperglycemia increases intravascular osmotic pressure, leading to polyuria and cellular dehydration; serum glucose level 500 to 900 mg/dL

7. Acute decrease in serum glucose level: hypoglycemia

- a. Causes: excess insulin or oral antidiabetic medications; too little food or too much exercise when receiving antidiabetic medications

- b. Pathophysiology: excessive insulin lowers serum glucose level as glucose is carried into cells; decreased food intake in relation to prescribed antidiabetic medications results in hypoglycemia; excessive exercise uses glucose for metabolism, decreasing serum glucose level

8. Long-term complications: all types subject to same complications; microangiopathy (e.g., retinopathy, nephropathy), macroangiopathy (e.g., peripheral vascular diseases, arteriosclerosis, coronary heart disease, cerebral vascular disease), neuropathy, skin problems (e.g., cellulitis, fungal infections, boils), periodontal disease ([Figure 9-2: Long-term complications of diabetes mellitus](#))

**FIGURE 9-2** Long-term complications of diabetes mellitus. (From Kumar V et al: *Robbins and Cotran pathologic basis of disease*, ed 8, Philadelphia, 2010, Saunders.)

## B Clinical findings

1. Subjective: polydipsia; polyphagia; fatigue; blurred vision (retinopathy; osmotic changes); peripheral neuropathy
2. Objective
  - a. Polyuria; weight loss; glycosuria; peripheral vascular changes; ulcers; delayed wound healing; infection; gangrene
  - b. Hyperglycemia: detected by casual plasma glucose measurement of 200 mg/dL or higher, fasting plasma glucose level of 126 mg/dL or higher, and 2-hour postload glucose level of 200 mg/dL or higher; monitored by hemoglobin A<sub>1c</sub> (Hb A<sub>1c</sub>, glycosylated hemoglobin) measurement, which reflects average glucose level over preceding 2 to 3 months and should not exceed 7%
3. DKA and HHNS
  - a. Hyperglycemia, glycosuria, polyuria
  - b. Dehydration (e.g., flushed, hot, dry skin; decreased skin turgor [tenting]); hyperosmolar blood; hypotension; tachycardia; thirst; headache; confusion; drowsiness
  - c. Metabolic acidosis (DKA only): Kussmaul respirations as body attempts to blow off carbon dioxide; ketonuria, sweet breath odor, anorexia, nausea, vomiting, decreased serum pH, decreased PCO<sub>2</sub>, decreased HCO<sub>3</sub>

#### 4. Hypoglycemia

- a. Insulin shock or reaction because of excessive insulin, deficient glucose, or excessive exercise
- b. Clinical findings result from sympathetic nervous system (SNS) stimulation or reduced cerebral glucose supply
- c. CNS effects (e.g., mental confusion, blurred vision, diplopia, slurred speech, fatigue, seizures)
- d. SNS (adrenergic) effects (e.g., nervousness, weakness, pallor, diaphoresis, tremor, tachycardia, hunger)

#### C Therapeutic interventions

##### 1. Lifestyle changes

- a. Weight control: obesity leads to insulin resistance that can be reversed by weight loss
- b. Regular exercise: increases insulin sensitivity; brisk walking, swimming, and bicycling are recommended
- c. Diet: current recommendations
  - (1) Caloric control to maintain ideal body weight
  - (2) 50% to 60% of caloric intake from carbohydrates with emphasis on complex carbohydrates, high-fiber foods rich in water-soluble fiber (e.g., oat bran, peas, all forms of beans, pectin-rich fruits and vegetables); avoidance of foods with high glycemic index (glycemic index refers to effect of particular foods on blood glucose level)
  - (3) Protein: consistent with the U.S. Dietary Guidelines, usually 60 to 85 g; 12% to 20% of daily calories
  - (4) Fat intake not to exceed 30% of daily calories (70 to 90 g/day); replace saturated fats with monounsaturated and polyunsaturated fats
  - (5) Dietary ratio: carbohydrate to protein to fat ratio usually about 5 : 1 : 2
  - (6) Distribute food evenly throughout day in three or four meals, with snacks added between meals and at bedtime as needed in accordance with total food allowance and therapy (insulin or oral hypoglycemics)
  - (7) Consistent, regulated food intake is basic to disease control with consistent exercise, medication, and glucose monitoring
  - (8) Basic tools for planning diet: food composition tables showing nutrient content and glycemic index of commonly used foods
- d. Self-monitoring of blood glucose (SMBG) level
  - (1) Blood glucose monitoring: finger stick—a drop of blood from the fingertip is put on special reagent strip, which is read by glucose monitor
  - (2) Interstitial glucose monitoring: continuous interstitial testing (via biosensor inserted subcutaneously) or intermittent transdermal testing (via interstitial fluid drawn through skin and tested with electrochemical sensor)
- e. Alternate site testing: forearm, upper arm, abdomen, thigh, base of thumb; rests fingertips; alternate sites have less capillary blood flow than fingertips and may

not reflect glucose levels that rapidly rise and fall; rotate site within one area consistently unless otherwise instructed because results at various areas differ

- (1) Use fingertip if hypoglycemia is expected or if client is experiencing rapid change in glucose level
- (2) Rub forearm vigorously until warm before testing
- (3) Use monitor designed for alternate site testing
- (4) Avoid use in arm on side of mastectomy; results may be lower; reduces risk of infection and lymphedema

## 2. Insulin administration

a. Adjusted after considering physical and emotional stresses; a specific type of insulin and schedule are prescribed; aggressive insulin therapy regimens are gold standard of care

### b. Insulin pump

- (1) External battery-operated device delivers insulin through needle inserted into subcutaneous tissue
- (2) Small (basal) doses of regular insulin programmed into computer and delivered every few minutes; bolus doses (extra preset amounts) delivered before meals
- (3) Improves glucose control for clients with wide variations in insulin need as result of irregular schedules, pregnancy, or growth requirements
- (4) Prescribed amount of insulin for 24 hours plus priming is drawn into syringe
- (5) Administration set is primed and needle inserted aseptically, usually into subcutaneous tissue of abdomen

c. Jet injectors: deliver medication through skin under pressure

3. Oral antidiabetics for certain clients with type 2 diabetes who cannot be managed with lifestyle changes alone; must have some functioning beta cells in islets of Langerhans

4. Other therapies: pancreatic islet cell grafts, pancreas transplants, implantable insulin pumps that continually monitor blood glucose level and release insulin accordingly, cyclosporin therapy to prevent beta cell destruction in type 1 diabetes

## 5. Management of DKA and HHNS

a. IV to provide fluid replacement and direct access to circulatory system, and indwelling urinary catheter to monitor urine output

b. Titration of IV regular insulin according to serum glucose levels

c. Replacement of lost electrolytes, particularly sodium and potassium, using blood studies to determine dosage; when insulin is administered potassium reenters the cell, resulting in hypokalemia

d. Cardiac monitoring if circulatory collapse is imminent or dysrhythmias associated with electrolyte imbalance occur

e. Acidosis treated according to cause

f. Monitoring for hypoglycemia as result of treatment

## 6. Management of hypoglycemia (insulin shock or reaction)

a. 15 g of carbohydrate (e.g., glucose gel, 3 glucose tablets, 4 to 6 ounces of juice or

soda, hard candy, 1 cup milk,  $\frac{1}{2}$  banana, 6 Saltine crackers, 1 tablespoon of sugar or honey)

- b. Insertion of an intravenous line for circulatory access if hemodynamically unstable
- c. Administration of 50% dextrose solution for profound hypoglycemia
- d. If unconscious, glucagon injection to stimulate glycogenolysis

#### 7. Management of Somogyi effect

- a. Insulin-induced hypoglycemia rebounds to hyperglycemia
- b. Epinephrine and glucagon are released in response to hypoglycemia
- c. Causes mobilization of liver's stored glucose, which induces hyperglycemia
- d. Treated by gradually lowering insulin dosage while monitoring blood glucose level, particularly during night when hypoglycemia is most likely to occur

#### 8. Management of Dawn phenomenon

- a. Early-morning hyperglycemia attributed to increased secretion of GH
- b. Treated by delaying administration of PM insulin or increased dosage

#### 9. Acetylcysteine therapy when contrast radiologic studies are performed to prevent contrast medium nephrotoxicity

## ***Nursing Care of Clients with Diabetes Mellitus***

### **Assessment/Analysis**

- 1. Familial history of diabetes mellitus
- 2. Cardinal signs of polyuria, polydipsia, and polyphagia
- 3. History of fatigue, visual changes, impaired wound healing, urinary tract infections, fungal infections, and altered sensation
- 4. Blood glucose and Hb A<sub>1c</sub> levels
- 5. Visual acuity and retinal changes
- 6. Vital signs and weight for baseline data
- 7. Urine for acetone and microalbumin levels
- 8. Renal function
- 9. Dietary and exercise patterns

### **Planning/Implementation**

- 1. Assist client and family to understand disease process
- 2. Encourage to express feelings about illness and the necessary changes in lifestyle and self-image
- 3. Help with administration of medication until self-administration is both physically and psychologically possible
- 4. Assist in recognizing need for activities and diet that promote and maintain ideal body weight
- 5. Monitor serum glucose level with routine finger sticks
- 6. Test urine for ketones if glucose level is high; obtain double-voided specimen or

specimen from port of retention catheter using sterile technique

7. Teach client and family

- a. Use blood glucose monitoring system to test blood glucose level; finger sticks are most reliable; continuous glucose monitoring systems supplement but should not replace finger stick; test blood glucose monitor for accuracy
  - b. Test urine for ketones when blood glucose level is high
  - c. Avoid infection
  - d. Seek professional foot care to cut toenails; provide foot care daily (e.g., wash, dry, and lubricate feet but not between toes; inspect feet for irritation; use mirror for soles and heels); protect feet (e.g., wear socks and well-fitting, closed shoes; avoid OTC corn medications; do not apply heating pads, ice, or tape to the feet); report problems immediately
  - e. Administer insulin using sterile technique; rotate injection sites (abdomen preferred) within an anatomic location if using nonhuman form of insulin (prevents lipodystrophy); measure dosage, noting types, strengths of insulin, and peak action periods; teach use of insulin pump if ordered (e.g., how to change subcutaneous needle and tubing every 3 days)
  - f. Use food tables when planning dietary intake
  - g. Avoid tight shoes and smoking, which will constrict circulation
  - h. Identify clinical findings of impending hypoglycemia (insulin shock, reaction); carry a carbohydrate source
  - i. Identify clinical findings of impending hyperglycemia (DKA, HHNS); carry insulin supplies and glucose monitoring equipment
8. Encourage to continue medical supervision, including visits to an eye care specialist and podiatrist
9. Encourage follow-up nutritional counseling
10. Screen client regularly for microalbuminuria to assess kidney function

## Evaluation/Outcomes

1. Adheres to medical regimen of diet, exercise, and medications
2. Maintains blood glucose and Hb A<sub>1c</sub> levels within an expected range
3. Verbalizes and demonstrates skills related to self-care
4. Remains free of complications

## Primary Aldosteronism (Conn Syndrome)

### Data Base

A Etiology and pathophysiology

1. Excessive secretion of aldosterone, a mineralocorticoid, secreted in response to renin-angiotensin system and ACTH; causes kidneys to retain sodium and excrete potassium and hydrogen
2. Usually caused by adenoma of adrenal cortex; also may be caused by hyperplasia or

carcinoma

## B Clinical findings

1. Subjective: muscle weakness and cramping, polydipsia, polyuria, paresthesia
2. Objective: hypertension, hypokalemia, hypernatremia, alkalosis, elevated urinary aldosterone levels, renal damage causing proteinuria and decreased urine specific gravity

## C Therapeutic interventions

1. Surgical removal of adrenal tumor
2. Potassium-sparing diuretic to control blood pressure; e.g., spironolactone (Aldactone)
3. Aldosterone antagonist to control blood pressure; e.g., eplerenone (Inspra)
4. Calcium channel blockers to reduce production of aldosterone
5. Thiazides to control blood pressure
6. Angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) are potential treatment options
7. Bilateral adrenalectomy requires lifelong corticosteroid therapy

## ***Nursing Care of Clients with Primary Aldosteronism***

### **Assessment/Analysis**

1. Vital signs
2. Electrolyte levels
3. I&O, urine specific gravity
4. Motor and sensory functions
5. Cardiac dysrhythmias as result of hypokalemia

### **Planning/Implementation**

1. Regulate fluid intake
2. Encourage continued health care supervision
3. Provide care after bilateral adrenalectomy
  - a. Monitor vital signs, hemodynamic state, and blood glucose level
  - b. Administer steroids with antacid, proton pump inhibitor (PPI), or H<sub>2</sub>-blocker to prevent GI erosion
  - c. Protect from infection and stressful situations
  - d. Explain drugs and side effects
  - e. Instruct to carry medical alert identification card
  - f. Monitor fluid balance; blood pressure for hypotension
  - g. Monitor for emotional upset, which may require an increase in steroid medications
4. Provide dietary instruction (e.g., encourage intake of foods high in potassium, avoidance of foods that contain sodium)

### **Evaluation/Outcomes**

1. Maintains blood pressure at an expected level

2. Selects foods low in sodium and high in potassium
3. Performs routine ADLs without fatigue

## Cushing Syndrome

### **Data Base**

#### A Etiology and pathophysiology

1. Excess secretion of adrenocortical hormones
2. Caused by hyperplasia or tumor of adrenal cortex; primary lesion may be in pituitary gland, causing excess production of ACTH
3. May be precipitated by administration of excess glucocorticoids or ACTH

#### B Clinical findings

1. Subjective: weakness, decreased libido, mood swings, steroid psychosis
2. Objective
  - a. Obese trunk, thin arms and legs; moon face; buffalo hump; acne; hirsutism; ecchymotic areas; purple striae on breast and abdomen; amenorrhea; increased susceptibility to infections
  - b. Hypertension
  - c. Hyperglycemia, hypokalemia, elevated plasma cortisol level
  - d. Elevated levels of 17-hydroxycorticosteroids and 17-ketosteroids in urine
  - e. Osteoporosis, fractures, kyphosis
  - f. Protein wasting, which causes muscle wasting and weakness
  - g. Hypernatremia caused by sodium and water retention, resulting in edema and hypertension

#### C Therapeutic interventions

1. Reduce dosage of externally administered corticoids
2. If lesion on pituitary is causing hypersecretion of ACTH: hypophysectomy or irradiation of pituitary; radiation in small doses over 6 weeks or stereotactic radiosurgery or gamma knife radiation may be given with a single high-dose intervention; radiation with cortisol-inhibiting drugs may help recovery
3. Surgical excision of adrenal tumors (adrenalectomy)
4. Adrenal enzyme inhibitors: ketoconazole (Nizoral), mitotane (Lysodren), metyrapone (Metopirone)
5. Potassium supplements
6. High-protein diet with sodium restriction

### **Nursing Care of Clients with Cushing Syndrome**

#### **Assessment/Analysis**

1. Baseline vital signs, weight, blood glucose level, and electrolytes
2. Physical appearance ([Figure 9-3](#): Common characteristics of Cushing syndrome)

**FIGURE 9-3** Common characteristics of Cushing syndrome. (From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011.)

### 3. Changes in coping and sexuality from history

## Planning/Implementation

1. Monitor vital signs, daily weight, I&O, blood glucose level, and electrolyte level
2. Protect from exposure to infections
3. Encourage ventilation of feelings by client and spouse because changes in body image and sex drive can influence spousal support
4. Attempt to minimize stress in environment (e.g., limit visitors, explain procedures carefully)
5. Provide instruction regarding diet and supplementation; encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, legumes) to improve and maintain nutritional status and prevent drug-induced nutrient deficiencies
6. Provide care after a bilateral adrenalectomy (see [Nursing Care under Primary Aldosteronism](#), [Nursing Care](#) in this Chapter)
7. Provide care after a hypophysectomy (see [Nursing Care under Hyperpituitarism](#), [Nursing Care](#) in this Chapter)

## Evaluation/Outcomes

1. Maintains fluid balance
2. Remains free of infection
3. Discusses feelings regarding physical changes

# Addison Disease (Primary Adrenal Insufficiency)

## **Data Base**

### A Etiology and pathophysiology

1. Hyposecretion of adrenocortical hormones
2. Usually autoimmune destruction of cortex or idiopathic atrophy
3. Addisonian crisis (acute adrenal insufficiency) precipitated by stresses (e.g., pregnancy, surgery, infection, dehydration, emotional turmoil); fatal if not treated
4. Associated with endocrine disorders, sudden cessation of glucocorticoids, adrenalectomy, tuberculosis, acquired immunodeficiency syndrome (AIDS)

### B Clinical findings

1. Subjective: weakness, fatigue, anorexia, nausea, lethargy
2. Objective
  - a. Increased bronze pigmentation of skin
  - b. Vomiting, diarrhea
  - c. Impaired protein anabolism resulting in emaciation and fatigue
  - d. Hypotension
  - e. Decreased levels of serum cortisol, 17-ketosteroids, and 17-hydroxysteroids; increased plasma ACTH level
  - f. Electrolyte imbalances: hyponatremia, hypoglycemia, hyperkalemia

### C Therapeutic interventions

1. Replacement of hormones: glucocorticoids to correct metabolic imbalance; mineralocorticoids to correct electrolyte imbalance and hypotension
2. Additional hormone replacement during illness or stress to prevent Addisonian crisis; e.g., hydrocortisone (Cortef), fludrocortisone
3. Correction of fluid, electrolyte, and glucose imbalances
4. High-carbohydrate, high-protein diet
5. Prevention of osteoporosis, which may develop with use of steroid therapy that breaks down protein matrix in bones

## **Nursing Care of Clients with Addison Disease**

### **Assessment/Analysis**

1. Baseline vital signs, weight, electrolytes, and serum glucose
2. 24-hour urine specimens for diagnostic purposes (17-hydroxycorticosteroids and 17-ketosteroids)
3. Appearance of skin
4. Changes in energy or activity from history

### **Planning/Implementation**

1. Monitor vital signs four times a day; identify increase in temperature (infection, dehydration), alterations in pulse rate and rhythm (hyperkalemia), and alterations in blood pressure

2. Monitor for clinical findings of sodium and potassium imbalance
3. Monitor I&O and weigh daily
4. Collect 24-hour urine specimen
  - a. Teach foods and medications to be avoided before test
  - b. Have client void at beginning of the 24-hour time period and discard urine
  - c. Place urine from every voiding into collection container; ensure that appropriate preservative is used and container is kept refrigerated, if necessary
  - d. Have client void at end of the 24-hour time period and place urine in container
5. Administer steroids as prescribed; give with antacid, PPI, or H<sub>2</sub>-blocker to limit ulcerogenic factor effect
6. Prevent exposure to others who may transmit infectious disease (e.g., provide a private room to prevent contact with other clients, limit number of visitors)
7. Advise to avoid physical and emotional stress
8. Teach need for lifelong hormone replacement therapy with increased dosage during stress
9. Review clinical findings of adrenal hypofunction and hyperfunction so client can identify need for adjustment of steroid dose
10. Instruct to wear medical alert band
11. Encourage diet consistent with U.S. Dietary Goals with emphasis on diet high in nutrient-dense foods and adequate sodium
12. Administer antiemetics to prevent fluid and electrolyte loss by vomiting

## Evaluation/Outcomes

1. Maintains fluid balance
2. Maintains electrolyte balance

## Pheochromocytoma

### **Data Base**

#### A Etiology and pathophysiology

1. Increased secretion of epinephrine and norepinephrine (catecholamines)
2. Catecholamine-secreting tumor of the adrenal medulla; usually benign
3. Familial tendency; peak incidence 25 to 50 years of age

#### B Clinical findings

1. Subjective: headache, visual disturbances, palpitations, anxiety, heat intolerance, psychoneurosis
2. Objective
  - a. Hypertension, postural hypotension, tachycardia, diaphoresis, tremors, cardiac dysrhythmias, hyperglycemia, dilated pupils; brain attack or blindness may occur
  - b. Increased levels of plasma and urinary catecholamines; increased vanillylmandelic acid (VMA), a product of catecholamine breakdown

#### C Therapeutic interventions

1. Surgical removal of tumor
2. Antihypertensives and antidysrhythmics: nitroprusside (Nitropress), propranolol (Inderal), phentolamine (Regitine)

## ***Nursing Care of Clients with Pheochromocytoma***

### **Assessment/Analysis**

1. Blood pressures with client in upright and horizontal positions
2. Clinical findings associated with hypertension
3. 24-hour urine specimens for VMA and catecholamine studies

### **Planning/Implementation**

1. Instruct to avoid coffee, chocolate, beer, wine, citrus fruit, bananas, and vanilla before test for VMA
2. Administer parenteral fluids and blood as ordered before and after surgery to maintain blood volume
3. Decrease environmental stimulation
4. Provide care after a bilateral adrenalectomy
  - a. Instruct regarding maintenance doses of steroids (see [Nursing Care under Primary Aldosteronism, Nursing Care](#) in this chapter)
  - b. Instruct to take antihypertensives as prescribed and to monitor blood pressure until it returns to expected range
5. Emphasize importance of continued medical supervision and screening for other family members

### **Evaluation/Outcomes**

1. Maintains blood pressure at expected level
2. Remains free of complications of hypertension

# CHAPTER 10

# Nursing Care of Clients with Integumentary System Disorders

---

# Overview

## Review of Anatomy and Physiology

### ***Functions of the Integumentary System***

- A Prevents loss of body fluids
- B Protects deeper tissues from pathogenic organisms, noxious chemicals, and short-wavelength ultraviolet radiation
- C Helps regulate body temperature
- D Provides location for sensory reception of touch, pressure, temperature, pain, wetness, tickle, etc.
- E Assists in vitamin D synthesis
- F Plays excretory role

### ***Structures of the Integumentary System***

- A Epidermis (outer layer)
  - 1. Contains no blood or lymphatic vessels; nourished by diffusion from underlying dermal papillae
  - 2. Melanocytes produce melanin, which colors skin
  - 3. Exceptional epidermal regions
    - a. Conjunctiva: epidermis so thin it is transparent
    - b. Lips: epidermis very thin and highly vascular
  - 4. Protects internal structures from harm and microorganisms
- B Dermis
  - 1. Vascular fabric of collagen and elastic fibers woven for strength and flexibility
  - 2. Contains abundant touch receptors
  - 3. Provides fingerprint pattern as unique arrangement of ridges projected to epidermal surface
  - 4. Skin stretched beyond certain limits (e.g., during pregnancy) may rupture dermal collagen and elastic fibers; consequent scar tissue repair produces striae gravidarum
- C Glands
  - 1. Eccrine: sweat glands opening in pores that secrete clear fluid
  - 2. Apocrine: scent glands found in the axillary, mammary, and genital areas
  - 3. Ceruminous: wax glands in external auditory canal
  - 4. Sebaceous: small, saclike glands lacking innervation, usually forming close to hairs and opening into upper portion of hair follicle
  - 5. Mammary: milk-secreting, alveolar glands; develop to full extent only during pregnancy
- D Hair
  - 1. Approximately same number of follicles in males and females; hormones stimulate differential growth
  - 2. Arrector pili (smooth muscle) attached at one end to connective sheath in middle of

hair follicle and at other end to papillary region of dermis; on contraction produces “goose bumps”

## ***Tissue Repair***

### **A Inflammation**

1. Vascular changes: initial vasoconstriction for hemostasis; vessel walls become lined with leukocytes (margination); vasodilation and increased vessel permeability (effects of histamine from mast cells, kinins, and prostaglandins); platelets clump and lymphatics become plugged with fibrin to wall off damaged area
2. Leukocytes leave vessels (diapedesis) and phagocytize foreign substances
3. Chronic inflammation: macrophages predominate and fibroblasts deposit collagen around each group of macrophages and foreign substances; stage of granuloma formation

### **B Fibroplasia**

1. Epithelialization: epithelial cells of epidermis begin to cover tissue defect
2. Deep in wound, fibroblasts synthesize collagen and ground substance; process begins about fourth or fifth day and continues for 2 to 4 weeks
3. Capillaries regenerate and tissue becomes red (granulation tissue)
4. Fibrin plugs are lysed

### **C Scar maturation**

1. Collagen fibers rearranged into stronger, more organized pattern
2. Scar remodels, gradually softens, and fades; hypertrophic scar or keloid forms if collagen synthesis exceeds breakdown
3. Contraction of wound margins begins about 5 days after injury; fibroblasts migrate into wound and assist in closing defect; may result in contractures that can be debilitating

## **Review of Physical Principles: Heat**

A Conduction: transfer of heat from one object to another by direct contact

B Evaporation: water vapor released by skin (perspiration) cools body surface, which decreases body temperature

C Radiation: transfer of heat from one object to another without actual contact

D Convection: transfer of heat away from body by air movement

## **Related Pharmacology**

### ***Pediculicides/Scabicides***

#### **A Description**

1. Act at the parasite's nerve cell membrane to produce death of the organism
2. Destroy parasitic arthropods
3. Available in topical preparations

B Examples: permethrin (Nix), pyrethrum extract/piperonyl butoxide (RID), lindane

(Kwell)

C Major side effects: skin irritation (hypersensitivity); contact dermatitis (local irritation); hepatotoxicity and nephrotoxicity

D Nursing care

1. Inspect skin, particularly scalp, for scabies and pediculosis before and after treatment; assess for skin irritation
2. Use gown, gloves, and hair covering to prevent spread of parasitic arthropods because scabies and pediculosis are highly contagious
3. Keep linen of infected client separate to prevent reinfection of client or family
4. Avoid drug contact with eyes and mucous membranes
5. Follow manufacturer's directions on length of direct exposure to agent (e.g., leave on for 10 minutes and then wash off) and frequency of use, especially with children; explain lice can live up to 30 days or more; avoid use during pregnancy

## **Antiinfectives**

A Description

1. Have bactericidal effect on bacterial cell wall or alter cellular function
2. Available in topical preparations

B Examples: mafenide (Sulfamylon); silver nitrate 0.5% solution; silver sulfADIAZINE (Silvadene)

C Major side effects

1. Silver sulfADIAZINE: skin irritation; hemolysis in clients with glucose-6-phosphate dehydrogenase (G-6-PD) deficiency; may not be used in presence of renal failure
2. Mafenide: metabolic acidosis; burning sensation when first applied
3. Silver nitrate: electrolyte imbalance; brownish black discoloration of skin

D Nursing care

1. Adhere to strict surgical asepsis; cleanse and ensure débridement before application
2. Apply prescribed medications
  - a. Silver sulfADIAZINE: apply thin layer; monitor G-6-PD level before treatment
  - b. Mafenide: assess for clinical findings of acidosis
  - c. Silver nitrate: apply dressings soaked in silver nitrate; protect self from contact with drug; assess for electrolyte imbalances
  - d. Prevent contamination of topical medication container

## **Antipruritics**

A Description

1. Inhibit sensory nerve impulse conduction at local site; exert local anesthetic effect
2. Relieve itching; promote comfort
3. Available in topical preparations

B Examples: benzocaine (Anbesol, Solarcaine), tetracaine (Pontocaine)

C Major side effects: skin irritation (hypersensitivity); contact dermatitis (local irritation)

D Nursing care

1. Assess lesion for location, size, and irritation
2. Discourage scratching; keep client's nails trimmed; avoid contact with open wounds
3. Advise medical follow-up because these medications provide only temporary relief of clinical findings
4. Prevent contamination of topical agent container

## ***Antiinflammatory Agents***

### A Description

1. Reduce clinical findings of inflammation
2. Produce vasoconstriction, which decreases swelling and pruritus
3. Available in topical preparations

### B Examples: triamcinolone (Kenalog, Triderm)

C Major side effects: skin irritation (hypersensitivity); contact dermatitis (local irritation); skin atrophy; adrenal insufficiency if absorbed systemically (suppression of hypothalamic-pituitary-adrenal axis); fungal overgrowth

### D Nursing care

1. Assess lesions for color, location, and size
2. Protect skin from scratching or rubbing
3. Avoid contact with eyes
4. Cleanse skin before application and reapplication
5. Assess for clinical findings of sensitivity
6. Avoid occlusive dressings unless directed otherwise
7. Prevent contamination of topical agent container

## ***Dermal Agents***

### A Description

1. Inhibit keratinization and sebaceous gland function to improve cystic acne and reduce sebum excretion
2. Available preparations: oral and topical

### B Examples: isotretinoin (Claravis, Amnesteem, Sotret), vitamin A acid (Retin-A)

C Major side effects: visual disturbances such as corneal opacities, decreased night vision (vitamin A toxicity—effect on visual rods); papilledema, headache (pseudotumor cerebri); hepatic dysfunction (hepatotoxicity); cheilitis (vitamin A toxicity); pruritus, skin fragility (dryness); hypertriglyceridemia (increased plasma triglycerides)

### D Nursing care

1. Assess visual and hepatic status before administration
2. Monitor levels of blood lipids before and during therapy
3. Instruct client
  - a. Avoid pregnancy during and for 1 month after therapy; use contraception if sexually active
  - b. Avoid vitamin A supplements
  - c. Side effects are reversible when therapy is discontinued

#### 4. Assess for depression or suicidal ideation

# Major Disorders of the Integumentary System

## Skin Lesions

### *Primary Lesions*

([Table 10-1](#): Primary Skin Lesions)

---

**Table 10-1**

**Primary Skin Lesions**

---

## Lesion

## Description

### Macule

Circumscribed, flat area with a change in skin color; less than 1 cm in diameter  
Examples: freckles, petechiae, measles, flat mole (nevus)

### Papule

Elevated, solid lesion; less than 1 cm in diameter  
Examples: wart (verruca), elevated moles

### Vesicle

Circumscribed, superficial collection of serous fluid; less than 1 cm in diameter  
Examples: varicella (chickenpox), herpes zoster (shingles), second-degree burn

### Plaque

Circumscribed, elevated superficial, solid lesion; greater than 1 cm in diameter  
Examples: psoriasis, seborrheic and actinic keratoses

### Wheal

Firm, edematous, irregularly shaped area; diameter variable  
Examples: insect bite, urticaria

### Pustule

Elevated, superficial lesion filled with purulent fluid  
Examples: acne, impetigo

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.

## Secondary Lesions

---

**Table 10-2**  
**Secondary Skin Lesions**

---

## Lesion

## Description

### Fissure

Linear crack or break from the epidermis to dermis; dry or moist  
Examples: athlete's foot, cracks at corner of the mouth

### Scale

Excess, dead epidermal cells produced by abnormal keratinization and shedding  
Examples: flaking of skin after a drug reaction or scarlet fever

### Scar

Abnormal formation of connective tissue that replaces normal skin  
Examples: surgical incision or healed wound

### Ulcer

Loss of the epidermis and dermis; craterlike; irregular shape

Examples: pressure ulcer, chancre

### Atrophy

Depression in skin resulting from thinning of the epidermis or dermis

Examples: aged skin, striae

### Excoriation

Area in which epidermis is missing, exposing the dermis

Examples: scabies, abrasion, or scratch

## Data Base

### A Etiology and pathophysiology

1. Interruption of circulation when pressure on skin exceeds capillary pressure of 32 mm Hg for prolonged periods
2. Pressure compresses capillaries and microthrombi form to occlude blood flow; tissue becomes damaged due to hypoxia
3. Commonly occur over bony prominences: sacrum, greater trochanter, heels, scapulae, elbows, malleoli, occiput, ears, and ischial tuberosities ([Figure 10-1](#): Common sites for pressure ulcers)

**FIGURE 10-1** Common sites for pressure ulcers. (From Harkreader H, Hogan MA, Thobaben M: *Fundamentals of nursing: caring and clinical judgment*, ed 3, St. Louis, 2007, Saunders.)

### 4. Contributing factors

- a. Immobility—results in prolonged pressure
- b. Aging—decreased epidermal thickness, elasticity, and secretion by sebaceous glands
- c. Moisture (e.g., perspiration, urine)—causes skin maceration
- d. Imbalanced nutrition—loss of subcutaneous tissue reduces padding; inadequate protein intake leads to negative nitrogen balance, decreased muscle mass, and impaired wound healing
- e. Pyrexia—causes increased cellular demand for oxygen
- f. Inadequate tissue oxygenation—edema, anemia, and circulatory disturbances

result in less oxygen delivered to tissues

g. Incontinence—substances in urine and feces irritate skin

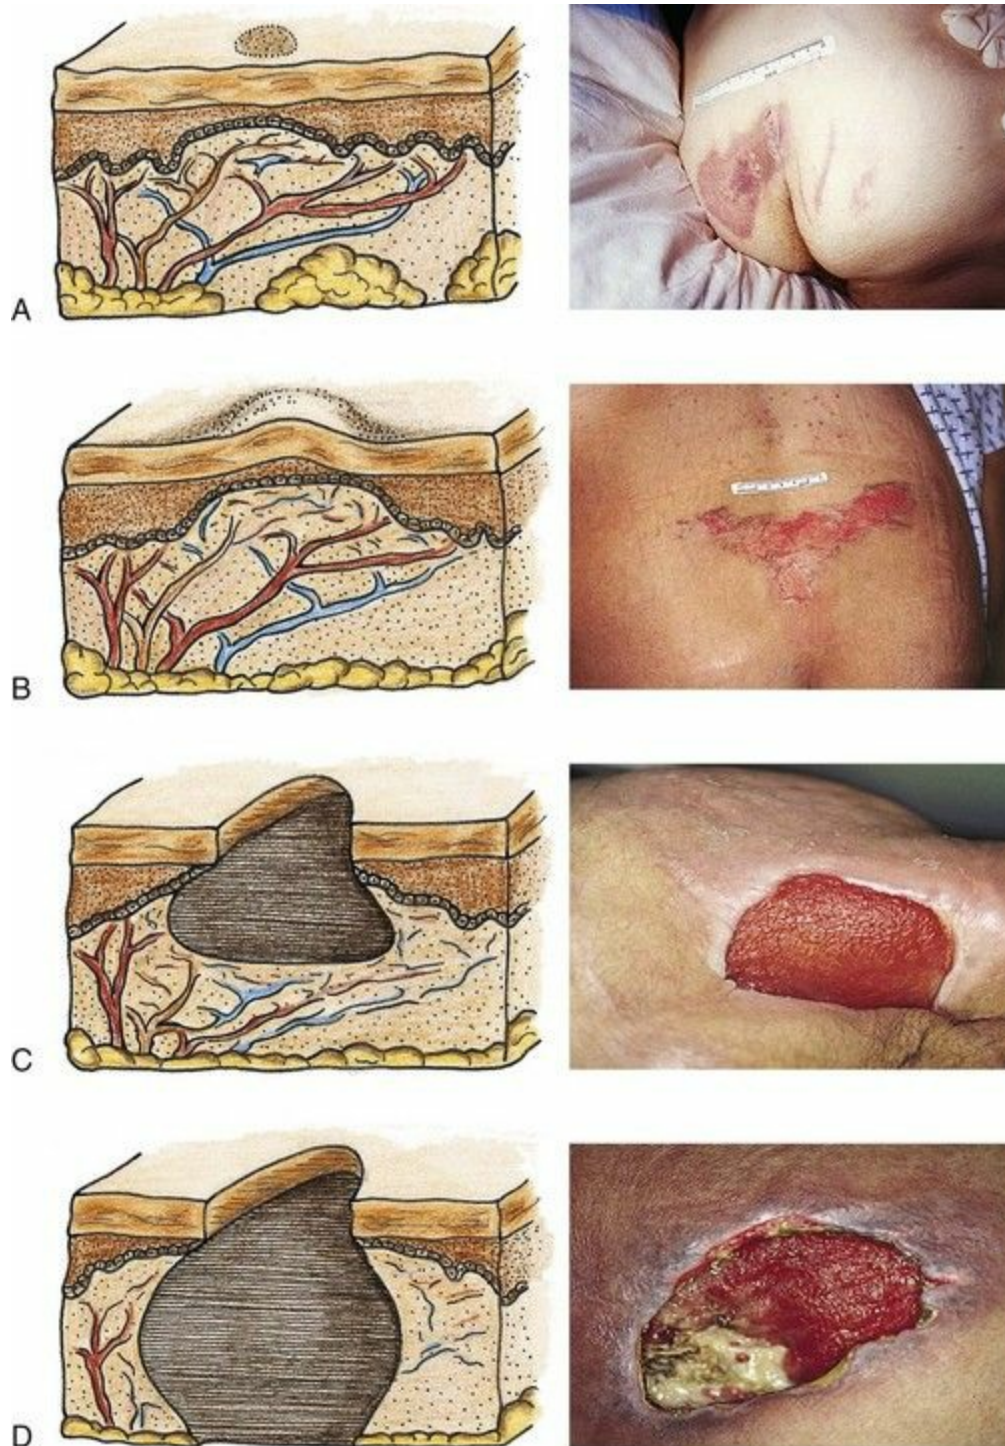

h. Dryness—skin less supple

i. Shearing force or friction—exerts excessive tension on skin

j. Cognitive impairments—unaware of discomfort; inability to protect self

k. Equipment—causes pressure, tension, or shearing forces on skin

5. Staging determined by depth and color ([Figure 10-2: Staging of pressure ulcers](#))

**FIGURE 10-2** Staging of pressure ulcers. **A**, Stage I pressure ulcer. **B**, Stage II pressure ulcer. **C**, Stage III pressure ulcer. **D**, Stage IV pressure ulcer. (Courtesy Laurel Wiersma, RN, MSN, Clinical Nurse Specialist, Barnes-Jewish Hospital, St. Louis, MO. In Potter PA, Perry AG: *Fundamentals of nursing*, ed 7, St. Louis, 2009, Mosby.)

a. Depth of tissue damage

- (1) Stage I: nonblanchable area of erythema; skin is intact; usually over bony prominence
- (2) Stage II: partial-thickness ulceration of epidermis and/or dermis; presents as abrasion, blister, or shallow crater; red/pink wound bed; without tissue sloughing; may be intact/open serum-filled blister
- (3) Stage III: full-thickness ulceration involving epidermis, dermis, and subcutaneous tissue; sloughing may be present; presents as deep crater with or without undermining; bone, tendon, or muscle is not exposed
- (4) Stage IV: extensive tissue damage involving full-thickness skin loss and damage to muscle, bone, and/or tendon; sloughing or eschar may be present on parts of wound bed; often includes undermining or tunneling

b. Color of wound

- (1) Black: necrotic
- (2) Yellow: exudate and yellow fibrous debris
- (3) Red: pink to red granulation

B Clinical findings

1. Subjective: pain; loss of sensation if there is sensory nerve damage
2. Objective: erythema; tissue damage (see Staging of pressure ulcers); exudate; pyrexia and leukocytosis if systemic infection is present

C Therapeutic interventions

1. Elimination/minimization of pressure on ulcer through frequent repositioning and use of supportive devices (e.g., air-fluidized beds, low-air-loss beds, or kinetic beds)
2. Administration of protein supplements or total parenteral nutrition (TPN) to prevent negative nitrogen balance if client has serum albumin level less than 3.5 g, is anorexic, or is less than 80% of ideal body weight
3. Administration of vitamin and mineral supplements (particularly vitamin C and zinc) to promote wound healing
4. Débridement of necrotic tissue, which interferes with healing and promotes bacterial growth: mechanical irrigation; chemical débridement with enzyme preparations; surgical débridement; wet-to-damp dressings
5. Application of dressings to promote healing
  - a. Moist gauze: maintains wound humidity, which promotes epithelial cell growth
  - b. Polyurethane film: provides barrier to bacteria and external fluid; promotes moist environment; permits view of wound
  - c. Hydrocolloid dressing: maintains wound humidity, liquefies necrotic debris, and provides a protective cushion
  - d. Absorptive dressing: absorbs drainage
  - e. Negative pressure wound therapy (NPWT); also known as vacuum-assisted wound closure (VAC): negative pressure applied to wound bed to remove exudate and facilitate angiogenesis ([Figure 10-3: Wound VAC System](#))

**FIGURE 10-3** Wound VAC V.A.C. system using negative pressure to remove fluid from area surrounding the wound, reducing edema and improving circulation to the area.

6. Antibiotic therapy
7. Skin grafts
8. Growth hormone therapy

## ***Nursing Care of Clients with Pressure Ulcers***

### **Assessment/Analysis**

1. Stage, size, and location
2. Type and amount of exudate
3. Risk factors (e.g., immobility, incontinence, malnutrition)
4. Skin condition daily of high risk clients

### **Planning/Implementation**

1. Emphasize preventive care when risk factors are identified
2. Change position at least every 2 hours and more frequently if necessary
3. Use supportive devices (e.g., pillows, heel and elbow pads, cushions, special mattresses or bed) to reduce pressure on bony prominences
4. Encourage activity to enhance circulation
5. Teach to change position every hour; teach how to shift weight to minimize pressure
6. Keep skin clean (bathing removes irritants and stimulates circulation), dry, and lubricated
7. Massage around bony prominences, but avoid massaging reddened areas that are already damaged
8. Ensure adequate fluid intake
9. Provide well-balanced diet; emphasize importance of protein, zinc, and vitamins C, A, and B
10. Avoid shearing force by lifting, not dragging, client during position changes, keep head of bed in lowest degree permitted

### **Evaluation/Outcomes**

1. Maintains intact skin
2. Consumes diet high in protein, zinc, and vitamins C, A, and B
3. Changes position every hour

## Burns

### Data Base

#### A Etiology and pathophysiology

1. Thermal, radiation, electrical, and chemical (e.g., acids, bases) forces cause cell destruction and result in depletion of fluid and electrolytes; extent of fluid and electrolyte loss directly related to extent and degree of burn
2. Classification of burn depth (Figure 10-4: Classification of burn depth)

**FIGURE 10-4** Classification of burn depth. (From Mahan LK, Escott-Stump S: *Krause's food and nutrition therapy*, ed 12, St. Louis, 2008, Saunders.)

- a. Superficial burn: involves epidermis; pink to red color; mild edema and pain; causes include sunburn, flash burns
- b. Superficial partial-thickness burn: involves epidermis; pink to red color; mild to moderate edema and pain; blisters; fluid loss slight, especially if less than 15% of body surface involved; causes include scalds, flames, brief contact with hot objects
- c. Deep partial-thickness burn: involves epidermis and dermis; red to white color; pain; vesicles with oozing; moderate edema; soft and dry eschar; causes include scalds, flames, prolonged contact with hot objects (e.g., tar, grease, chemicals)
- d. Full-thickness burn: involves entire dermis and at times subcutaneous tissue; black, brown, yellow, white, red color; dry skin; hard and inelastic eschar; pain may be present or absent; fluid loss usually severe, especially if more than 2% of body surface is involved; causes include flames, electricity, chemicals

- e. Deep full-thickness burn: involves skin, fat, muscle, and bone; areas are charred or burned away; absence of edema and pain; causes include flames, electricity, grease, tar, chemicals

### 3. Classification of burn injury

- a. Minor burns: no involvement of hands, face, or genitalia; total partial-thickness burn area does not exceed 15%
- b. Moderate burns: partial-thickness involvement of 15% to 25% of body; but full-thickness burns do not exceed 10% of body area
- c. Major burns: involvement exceeds 25% (if partial-thickness) or 10% (if full-thickness) of body surface; involvement of hands, face, genitalia, or feet; this classification is used if client has preexisting chronic health problem, is younger than 18 months or more than 50 years of age, or has additional injuries

### 4. Pulmonary injury should be suspected if two of the following factors are present, and expected if three or four are present

- a. Hair in nostrils singed; soot around mouth or nostrils
- b. Client was trapped in a closed space
- c. Face, nose, and lips burned
- d. Initial blood sample contains carboxyhemoglobin

### 5. Percentage of body surface area involved: estimated by Lund-Browder chart or Rule of Nines ([Figure 10-5](#): Rule of Nines)

**FIGURE 10-5** Rule of Nines. A commonly used assessment tool with estimates of the percentages (in multiples of 9) of the total body surface area burned. **A**, Adults (anterior view). **B**, Adults (posterior view). (From Thompson JM et al: *Mosby's clinical nursing*, ed 5, St. Louis, 2002, Mosby.)

### 6. Phases of burn injury

- a. Resuscitation (emergent): initial life-threatening stage; usually 24 to 48 hours; major concerns are respiratory status because of smoke inhalation, hypovolemia because of fluid shifts out of cells (capillary leak syndrome), and hyperkalemia

because of cellular destruction

- b. Acute (remobilization/diuretic): begins with mobilization of fluids and electrolytes back into cells and ends when burns are healed or covered by skin grafts; may take days, weeks, or months; major concerns are hypervolemia and hypokalemia (fluid and electrolytes shift back into intravascular and intracellular compartments) and infection
- c. Rehabilitative: begins when wounds are healed and the ability to resume self-care occurs; may take weeks to months; major concern is resuming functional roles and coping with body image disturbances

#### 7. Curling's ulcer may occur after a burn

- a. Clinical findings: reports of gastric discomfort; profuse gastrointestinal bleeding
- b. Usually occurs by end of first week after burn injury
- c. Treatment essentially same as for gastric ulcer; however, mortality after surgical repair is high because of debilitated state

#### 8. Suppressed immune system involving lymphocytes, immunoglobulin production, and changes in neutrophil and macrophage functioning

### B Clinical findings

#### 1. Subjective: extreme anxiety; restlessness (may indicate cerebral hypoxia); pain (depends on depth and extent of burn); paresthesia; disorientation

#### 2. Objective

- a. Changes in appearance of skin indicate degree of burn
- b. Hematuria; blood hemolysis with subsequent rise in plasma hemoglobin level may occur with full-thickness burns
- c. Elevated hematocrit level because of fluid loss or deceptively normal values because of protein losses from weeping wounds
- d. Electrolyte imbalance: cellular destruction results initially in hyperkalemia, hyponatremia, and hyperuricemia
- e. Clinical findings related to hypovolemic shock; seepage of water, plasma, proteins, and electrolytes from burned area causes circulatory failure
- f. Presence of clinical findings similar to hypovolemic shock caused by fright, terror, hysteria, and pain involved in situation
- g. Evidence of renal impairment (e.g., increased blood urea nitrogen [BUN] and creatinine levels) if acute tubular necrosis occurs as result of circulatory collapse

### C Therapeutic interventions

#### 1. Establishment of airway and administration of oxygen; mechanical ventilation as needed

#### 2. IV fluid replacement in first 24 hours (e.g., electrolyte solutions and colloids such as blood and plasma) to maintain circulation

- a. Volume of fluid replacement is based on percentage of body surface area involved and client's weight (e.g., Parkland/Baxter, Brooke Army Hospital, or Evans formulas)
- b. Half of fluid is administered in first 8 hours; second half is administered over next 16 hours

3. IV fluid replacement in subsequent hours depends on urinary output, blood tests, and hemodynamic pressures
4. Insertion of urinary retention catheter; hourly urinary output to monitor kidney function and influence fluid replacement
5. Insertion of central line to monitor hemodynamic pressures (e.g., central venous pressure [CVP], pulmonary capillary wedge pressure [PCWP])
6. Vital signs monitored every 15 minutes
7. Serum electrolytes and blood gases to monitor levels and assist in deciding replacement therapy
8. Tetanus toxoid booster administration; tetanus human immune globulin for passive immunity if not previously immunized
9. Clear liquids followed by high-protein, high-carbohydrate, high-fat, high-vitamin diet as tolerated. Caloric needs may be as high as 5000 calories daily; high calorie enteral feedings may be necessary (research demonstrates that early nutritional support within several hours of injury can decrease mortality and complications)
10. Maintenance of surgical asepsis
11. Daily hydrotherapy; water temperature should be tepid (98° to 100° F)
12. Skin grafting to close wounds, limit fluid loss, promote healing, and limit contractures
  - a. Heterograft (xenograft): skin from animals, usually pigs (porcine xenograft); temporary covering
  - b. Homograft (allograft): skin from another person or cadaver; temporary covering
  - c. Autograft: skin from another part of client's body
    - (1) Mesh graft: machine used to mesh skin obtained from donor site so it can be stretched to cover larger area of burn
    - (2) Postage stamp graft: earlier method of accomplishing same goal as mesh graft; small amount of skin is used to cover larger area; donor skin is cut into small pieces and applied to burn
    - (3) Sheet grafting: large strips of skin placed over burn as close together as possible
    - (4) Cultured epithelial autografting is used for massive burn treatment
  - d. Synthetic coverings
13. Surgical, mechanical, or enzymatic débridement to promote healing and decrease infection
14. IV antibiotics based on wound culture and sensitivity [C&S]; topical antibiotics (e.g., mafenide ointment, silver nitrate solution, silver sulfADIAZINE, neomycin, bacitracin, polymyxin B); used to limit infection
15. Opioids to reduce pain and sedatives to decrease anxiety; given IV or orally because of decreased muscle absorption

## ***Nursing Care of Clients with Burns***

### **Assessment/Analysis**

1. Clinical findings of airway involvement (e.g., burns of face, neck, or chest; sooty sputum; hoarseness)
2. Vital signs, arterial blood gases, and breath sounds to establish baseline for respiratory function
3. CVP or PCWP, and urine output, to establish baseline for assessment of circulation
4. Estimated body surface area involvement and severity (extent and depth) of burns

## Planning/Implementation

1. Apply cool, moist dressing at site of injury; neutralize burn if caused by chemical (e.g., acid, base); flush with water and apply the opposite chemical in a weak form as ordered
2. Monitor vital signs, CVP or PCWP, and intake and output (I&O) (hourly urine output) as ordered; notify health care provider if output decreases below 30 mL/hr or increases above 50 mL/hr
3. Observe for clinical findings of metabolic acidosis and electrolyte imbalances, particularly of calcium, potassium, and sodium and metabolic acidosis
4. Administer fluid and electrolytes as ordered
5. Monitor respiratory function (e.g., characteristics of respirations, breath sounds, arterial blood gases, pulse oximetry)
6. Administer oxygen as ordered
7. Elevate head of bed
8. Encourage coughing, deep breathing, and use of incentive spirometer
9. Prevent infection
  - a. Monitor for clinical findings of infection (e.g., increasing temperature and white blood cell (WBC) count, odor); promptly culture exudate if infection is suspected
  - b. Follow principles of protective precautions (e.g., gown, gloves, mask, hair covering) during contact because of client's compromised ability to resist infection
  - c. Administer tetanus toxoid as prescribed
  - d. Administer IV and topical antibiotics as prescribed
  - e. Use sterile technique for wound care
10. Apply pressure dressings as ordered to reduce contractures and scarring
11. Support joints and extremities in functional alignment and perform range-of-motion (ROM) exercises; use beds or mattresses designed to avoid pressure
12. Provide care related to skin graft
  - a. Keep donor sites dry (which are covered with a nonadherent dressing and wrapped in absorbent gauze); remove just absorbent gauze as nonadherent dressing will separate as healing occurs
  - b. Monitor grafts, which generally are covered with light pressure dressing for approximately 3 days; after graft has "taken," roll cotton-tipped applicators gently over graft to remove underlying exudate; exudate allowed to remain can promote infection and prevent graft from adhering; instruct to restrict mobility of affected part
  - c. Monitor for clinical findings of infection (e.g., foul-smelling drainage, temperature elevation); promptly culture exudate if infection is suspected
  - d. Instruct to avoid exposure of graft and donor sites to the sun

13. Provide physical and emotional support while turning
14. Keep room temperature warm and humidity high
15. Prevent gastrointestinal (GI) erosion
  - a. Observe for clinical findings of stress ulcer
  - b. Give prescribed drugs to decrease or neutralize hydrochloric acid
  - c. Provide small, frequent feedings; diet high in protein, carbohydrates, vitamins, and minerals; moderate in fat; adequate calories for protein sparing
16. Administer medication for pain as prescribed and particularly before dressing change
17. Provide emotional support
  - a. Expect client to express negative feelings; accept negative feelings
  - b. Explain need for staff wearing gowns and masks
  - c. Assist to cope with change in body image
  - d. Give realistic reassurance; convey a positive attitude
  - e. Encourage participation in self-care
  - f. Refer client and family to support groups and rehabilitative services

## Evaluation/Outcomes

1. Maintains respiratory function
2. Maintains fluid balance
3. Remains free of infection
4. Expresses feelings about altered body image

## Cellulitis

### Data Base

#### A Etiology and pathophysiology

1. Infection of deep layers of dermis; spreads along connective tissue planes
2. Usually caused by streptococcal or staphylococcal organisms
3. Microorganism enters tissue through abrasion, bite, trauma, or wound
4. Erysipelas is an acute infection of superficial dermis and lymphatics caused by *beta-hemolytic group A streptococci*
5. Necrotizing fasciitis is cellulitis that extends to the fascia, causing thrombosis of subcutaneous vessels and gangrene of tissue

#### B Clinical findings

1. Subjective: pain; itching
2. Objective: swelling; redness; warmth; leukocytosis

#### C Therapeutic interventions

1. IV, intramuscular (IM), or oral antibiotic therapy after sending specimen for culture and sensitivity
2. Rest with elevation of extremity
3. Warm compresses

### Nursing Care of Clients with Cellulitis

## Assessment/Analysis

1. Progression of clinical findings
2. Clinical findings associated with inflammation
3. Evidence of tissue trauma
4. Evidence of impaired immune response from history
5. Vital signs and WBC count for data base

## Planning/Implementation

1. Monitor vital signs and WBC count for evidence of systemic involvement; assess peripheral tissue perfusion
2. Use contact precautions and surgical asepsis as indicated
3. Administer analgesics and antibiotics as prescribed
4. Elevate extremity
5. Apply warm compresses as ordered; protect from thermal trauma

## Evaluation/Outcomes

1. Experiences resolution of inflammatory process
2. Reports relief of pain

## Cancer of the Skin

### **Data Base**

A Etiology and pathophysiology

1. Most common cancer; slow progression and high cure rate if detected early for some types
2. Exposure to the sun, irritating chemicals, and chronic friction implicated; more common in persons with fair complexions
3. Types ([Figure 10-6: Cancer of the skin](#))

**FIGURE 10-6** Cancer of the skin. **A**, Basal cell carcinoma. **B**, Squamous cell carcinoma. **C**, Melanoma. (**A**, from Belcher AE: *Cancer nursing*, St. Louis, 1992, Mosby. **B**, from Habif TP: *Clinical dermatology: a color guide to diagnosis and therapy*, ed 3, St. Louis, 1996, Mosby. **C**, from Zitelli BJ, Davis HW: *Atlas of pediatric physical diagnosis*, ed 5, St. Louis, 2007, Mosby.)

- a. Basal cell carcinoma: appears as waxy nodule that may have telangiectasia visible; generally on face; most common type of skin cancer, but metastasis is rare
- b. Squamous cell carcinoma: appears as small, red, nodular lesion; generally on upper extremities and face, which are exposed to the sun; may develop secondarily to precancerous lesions such as keratosis and leukoplakia; develops rapidly and may metastasize through local lymph nodes
- c. Malignant melanoma: color of lesion may vary greatly (white, flesh, gray, brown, blue, black); suspected with changes in size, color, sensation, or characteristics of a mole; arises from pigment-producing melanocytes; most serious type of skin cancer; metastasis via blood can be extensive

## B Clinical findings

1. Subjective: pruritus may or may not be present; localized soreness
2. Objective: change in color, size, or shape of preexisting lesion; oozing, bleeding, or crusting; biopsy of lesion reveals type of cancer; lymphadenopathy if metastasis has occurred

## C Therapeutic interventions

1. Surgical excision of lesion and surrounding tissue. Sequential removal of progressive layers of tissue until healthy tissue is identified (Mohs micrographic surgery); preserves as much healthy tissue as possible

2. Chemosurgery, which involves use of zinc chloride to fix cells before they are dissected by layers
3. Cryosurgery—using liquid nitrogen to destroy tumor cells by freezing
4. Radiation: malignant melanoma does not respond well to this mode of treatment
5. Electrodesiccation and curettage: mechanical disruption of cells by heat; cells are then cut away with curet
6. Laser light is used to vaporize lesions
7. Chemotherapy
8. Immunotherapy: Nonspecific immunostimulants such as bacille Calmette-Guérin (BCG) vaccine; ipilimumab (Yervoy) for late-stage melanoma

## ***Nursing Care of Clients with Cancer of the Skin***

### **Assessment/Analysis**

1. History of changes in size, color, shape, sensation, or unusual bleeding of lesions
2. Risk factors from history
3. Skin for presence of suspicious lesions, documenting objective and subjective characteristics

### **Planning/Implementation**

1. Instruct to examine moles for changes and have those subject to chronic irritation (e.g., bra or belt line) removed
2. Encourage to avoid sun exposure; use sunscreens with a rating higher than 15 SPF (solar protection factor); wear protective clothing (e.g., long sleeves, pants, and hat)
3. Emphasize continued medical supervision
4. Encourage verbalization; maintain therapeutic environment
5. Provide care to client receiving radiation: observe skin for local reaction; teach to avoid use of ointments or powders containing metals
6. Provide care related to specific chemotherapeutic agents (see Neoplastic Disorders, Related Pharmacology in [Chapter 3](#))
7. Support natural defense mechanisms of client; encourage intake of nutrient-dense foods with emphasis on fruits, vegetables, whole grains, and legumes, especially those high in immune-stimulating nutrients selenium and vitamins A, C, and E; beta-carotene has been associated with prevention of skin cancer
8. Encourage to verbalize fears

### **Evaluation/Outcomes**

1. Avoids exposure to sun and known irritants
2. Examines skin lesions regularly and reports changes
3. Verbalizes acceptance of physical appearance after surgical excision of lesions

## **Herpes Zoster (Shingles)**

## **Data Base**

### A Etiology and pathophysiology

1. Acute viral infection of structures along pathway of peripheral nerves caused by reactivation of latent varicella-zoster virus
2. May involve eyes, leading to keratitis, uveitis, and blindness
3. Occurs in people who have had chickenpox and are exposed to an affected individual
4. Commonly occurs in immunosuppressed clients (e.g., leukemia, lymphoma) who have previously had chickenpox

### B Clinical findings

1. Subjective: pain; paresthesias; pruritus
2. Objective: vesicles along involved nerves; stains made from lesion exudate isolate the causative microorganism

### C Therapeutic interventions

1. Administration of acyclovir (Zovirax) or valacyclovir (Valtrex)
2. Medications for pain, relaxation, itching, and prevention of secondary infection
3. Pain control by blocking nerves through injection of drugs such as lidocaine or applying medication such as triamcinolone (Kenalog)
4. Antiinflammatory drugs such as systemic or topical steroids
5. Prevention: vaccine available (Zostavax) for people 60 years or older; reduces development of and chronic pain associated with shingles, which is common in older adults; may reduce risk by 50%

## **Nursing Care of Clients with Herpes Zoster**

### **Assessment/Analysis**

1. Presence of characteristic lesion
2. Progression of clinical findings from history; includes factors that compromise immune response (e.g., age, disease, chemotherapy)

### **Planning/Implementation**

1. Administer analgesics and other medications as prescribed
2. Reduce itching and protect lesions from air by application of salves, ointments, lotions, and sterile dressings as prescribed
3. Protect from pressure by use of air mattress, bed cradle, and light, loose clothing; teach to wear cotton fabrics and avoid synthetic and woolen materials
4. Use airborne and/or contact precautions as indicated
5. Administer antibiotics as prescribed
6. Encourage to avoid scratching and to use gloves at night to limit trauma from accidental scratching; explain basis for rash and pruritus
7. Allay fears about shingles by providing objective information
8. Encourage to express feelings
9. Encourage diet rich in nutrient-dense foods such as fruits, vegetables, whole grains,

- and legumes to improve and maintain nutritional status and prevent possible drug-induced nutrient deficiencies; encourage intake of vitamin C because it is reported to stimulate immune response to viral infection by increasing interferon, which limits viral reproduction in early stages
10. Teach hand hygiene to help prevent spread of virus; individuals who have not had chickenpox should not be exposed to client
  11. Provide emotional support because client is coping with severe pain and social isolation

## **Evaluation/Outcomes**

1. Experiences an improvement in skin integrity
2. Reports that pain and pruritus have subsided

## **Systemic Lupus Erythematosus (SLE)**

### **Data Base**

#### **A Etiology and pathophysiology**

1. Necrosis of glomerular capillaries, inflammation of cerebral and ocular blood vessels, necrosis of lymph nodes, vasculitis of GI tract and pleura, and degeneration of basal layer of skin
2. Immune complex deposits in blood vessels, among collagen fibers, and on organs
3. Affects connective tissue and is thought to result from defect in body's immunologic mechanisms, genetic predisposition, or environmental stimuli; actual cause unknown
4. More common in females, ages 15 to 40

#### **B Clinical findings**

1. Subjective: malaise, photosensitivity, joint pain
2. Objective
  - a. Fever, butterfly erythema on face, erythema of palms, Raynaud phenomenon, weight loss, and evidence of impaired renal, gastrointestinal, cardiac, respiratory, and neurologic functions
  - b. Positive lupus erythematosus preparation (LE prep); increased antinuclear antibodies (ANAs) in blood

#### **C Therapeutic interventions**

1. Corticosteroids and analgesics to reduce inflammation and pain
2. Supportive therapy as major organs become affected
3. Antimalarial drugs: hydroxychloroquine (Plaquenil) to treat fatigue, joint pain, skin rashes and lung inflammation
4. Immunosuppressives: belimumab (Benlysta), azathioprine (Azasan, Imuran), cyclophosphamide (Cytosan)
5. Plasmapheresis to remove autoantibodies and immune complexes from the blood
6. Life-threatening SLE may be treated with stem cell transplants

## **Nursing Care of Clients with Systemic Lupus Erythematosus**

## Assessment/Analysis

1. Progression of clinical findings from the history
2. Presence of skin lesions
3. Sensitivity to light (photosensitivity)
4. Vital signs for baseline data
5. Heart and lung sounds
6. Abdomen for enlargement of liver and spleen
7. Neurologic status
8. Renal function (review BUN and creatinine analysis results)

## Planning/Implementation

1. Administer corticosteroids and observe for side effects; teach client to do the same (see Antiinflammatory Agents under Related Pharmacology)
2. Help client and family cope with severity of disease and its poor prognosis
3. Explain importance of protecting skin (e.g., use of mild soap and sun-blocking agents, avoidance of exposure to sunlight)
4. Help to establish program of exercise balanced by rest periods to avoid fatigue
5. Instruct to alter consistency and frequency of meals if dysphagia and anorexia exist
6. Encourage diet rich in nutrient-dense foods such as fruits, vegetables, whole grains, and legumes to improve and maintain nutritional status and compensate for nutrient interactions of corticosteroid and other therapeutic medications; emphasize need for vitamin C-enriched foods because it is essential in biosynthesis of collagen, and large doses are found to increase total collagen synthesis
7. Teach to prevent infection (e.g., hand hygiene, avoidance of individuals with infections)
8. Emphasize need for continued medical supervision

## Evaluation/Outcomes

1. Demonstrates reduction in skin lesions
2. States that pain is reduced
3. Verbalizes fears with family and health care providers

## Progressive Systemic Sclerosis (Scleroderma)

### Data Base

A Etiology and pathophysiology

1. Systemic disease causes fibrotic changes in connective tissue throughout body
2. May involve skin, blood vessels, synovial membranes, esophagus, heart, lungs, kidneys, or GI tract
3. CREST syndrome refers to group of clinical findings associated with poor prognosis: Calcium deposits in organs; Raynaud phenomenon; Esophageal dysfunction; Sclerodactyly (scleroderma of the digits); Telangiectasia (vascular lesions formed by

dilation of a group of small blood vessels)

4. Thought to be caused by autoimmune defect; occurs more in women than in men

## B Clinical findings

1. Subjective: articular pain, muscle weakness

2. Objective

a. Hard skin that eventually adheres to underlying structures; face becomes masklike; body motion restricted

b. Telangiectases on lips, fingers, face, and tongue

c. Dysphagia

d. Raynaud phenomenon

e. Positive LE preparation, elevated gamma-globulin levels, presence of ANAs

## C Therapeutic interventions

1. Immunosuppressants: cycloSPORINE (Gengraf, Neoral) and methotrexate (Trexall); corticosteroids are rarely prescribed because they can cause a sudden decrease in renal function

2. Salicylates or analgesics for joint pain

3. Vasodilators for clinical findings of Raynaud phenomenon: angiotensin-converting enzyme inhibitors; calcium channel blockers; alpha blockers; nitroglycerin topical ointment to digits

4. Physical therapy

## ***Nursing Care of Clients with Scleroderma***

### **Assessment/Analysis**

1. Onset and progression of clinical findings

2. Skin, particularly of hands and face

3. Joints for inflammation

### **Planning/Implementation**

1. Support client and family emotionally; there is no cure at present

2. Instruct client

a. Use mild soaps and lotions for skin care

b. Avoid smoking

c. Limit exposure to cold

d. Encourage deep-breathing exercises

e. Monitor for side effects of immunosuppressive drugs (e.g., infection)

3. Monitor function of all vital organs (e.g., cardiac, respiratory, and renal status)

### **Evaluation/Outcomes**

1. Maintains skin integrity

2. Verbalizes acceptance of changes in appearance and disease

3. Reports clinical findings of vital organ involvement

# CHAPTER 11

# Nursing Care of Clients with Neuromusculoskeletal System Disorders

---

# Overview

## Review of Anatomy and Physiology

### *Structures and Functions of the Nervous System*

#### Overview

A Central nervous system (CNS)

1. Brain
2. Spinal cord

B Peripheral nervous system (PNS)

1. Cranial nerves
2. Spinal nerves
3. Autonomic nervous system (ANS)
  - a. Sympathetic nervous system: mediated by neurotransmitter norepinephrine
  - b. Parasympathetic nervous system: mediated by neurotransmitter acetylcholine

#### Neurons

Nerve cells: basic structural and functional units

A Types

1. Sensory (afferent) neurons: transmit impulses to spinal cord or brain
2. Motoneurons (efferent): transmit impulses away from brain or spinal cord to muscles or glands
  - a. Upper motor neurons: located in CNS; destruction causes loss of voluntary control, muscle spasticity, and hyperactive reflexes
  - b. Lower motor neurons: cranial and spinal efferent neurons that lie in gray matter of spinal cord and extend into the peripheral nervous system and end at myoneural junctions in muscles; destruction causes loss of voluntary control, muscle flaccidity, and loss of reflexes

B Impulse transmission

1. Cell body: contains a nucleus and other cytoplasmic matter
2. Dendrite: carry impulses toward cell body
3. Axon: carries impulse away from cell body
4. Myelin: multiple, dense layers of membrane around an axon or dendrite; myelinated nerve fibers transmit nerve impulses more rapidly than nonmyelinated fibers
5. Nerve impulses are excitatory or inhibitory
6. Synapse
  - a. Point of contact between axon of one cell and dendrites of another
  - b. Axons enlarge to form synaptic terminals that secrete neurotransmitters

#### Brain

A General considerations

1. Has large blood supply and high oxygen consumption
2. Uses glucose for energy metabolism, so hypoglycemia can alter brain function
3. Protected by blood-brain barrier, a selective filtration system that isolates the brain from certain substances in the general circulation
4. Basic tissue types: neuron cell aggregations (gray matter) and tracts of myelinated fibers (white matter)

#### B Brainstem

1. Consists of medulla, pons, and midbrain
2. Conducts impulses between spinal cord and brain; most motor and sensory fibers decussate (cross over) in medulla
3. Contains reflex centers for heart, respirations, vomiting, coughing, and swallowing; controls blood vessel diameter
4. Cranial nerves III through XII originate in brainstem

C Cerebellum: exerts synergic control over skeletal muscles, producing smooth, precise movements; coordinates skeletal muscle contractions; promotes posture, equilibrium, and balance

#### D Diencephalon

1. Thalamus
  - a. Crudely translates sensory impulses into sensations but does not localize them
  - b. Processes motor information from cerebral cortex and cerebellum and projects it back to motor cortex
  - c. Contributes to emotional component of sensations (pleasant or unpleasant)
2. Hypothalamus
  - a. Part of neural path by which emotions and other cerebral functions can alter vital, automatic functions (e.g., heartbeat, blood pressure, peristalsis, and secretion by glands)
  - b. Secretes neuropeptides that influence secretion of various anterior pituitary hormones
  - c. Produces antidiuretic hormone (ADH) and oxytocin, which are secreted by the posterior pituitary
  - d. Contains appetite center and satiety center
  - e. Serves as a heat-regulating center by relaying impulses to lower autonomic centers for vasoconstriction, vasodilation, and sweating, and to somatic centers for shivering
  - f. Maintains waking state; part of arousal or alerting neural pathway
3. Optic chiasm: point of crossing over (decussation) of optic nerve fibers

E Cerebral cortex: consists of multiple lobes divided into two hemispheres covered by gray matter forming folds (convolutions) composed of hills (gyri) and valleys (sulci) (Figure 11-1: Cerebral cortex)

**FIGURE 11-1** Cerebral cortex. (Modified from Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

1. Frontal lobe
    - a. Influences abstract thinking, sense of humor, and uniqueness of personality
    - b. Controls contraction of skeletal muscles and synchronization of muscular movements
    - c. Exerts control over hypothalamus; influences basic biorhythms
    - d. Controls muscular movements necessary for speech (Broca area)
  2. Parietal lobes
    - a. Translate nerve impulses into sensations (e.g., touch, temperature)
    - b. Interpret sensations; provide appreciation of size, shape, texture, and weight
    - c. Interpret sense of taste
  3. Temporal lobes
    - a. Translate nerve impulses into sensations of sound and interpret sounds (Wernicke's area; usually in dominant hemisphere)
    - b. Interpret sense of smell
    - c. Control behavior patterns
  4. Occipital lobe
    - a. Interprets sense of vision
    - b. Provides appreciation of size, shape, and color
- F Brain and spinal cord protection
1. Vertebrae around cord; cranial bones around brain
  2. Meninges
    - a. Dura mater: white fibrous tissue, outer layer
    - b. Arachnoid: "cobwebby" middle layer
    - c. Pia mater: innermost layer; adheres to outer surface of cord and brain; contains blood vessels
  3. Spaces
    - a. Subarachnoid space: around brain and cord between arachnoid and pia mater
    - b. Subdural space: between dura mater and arachnoid

- c. Epidural space: between dura mater and cranial bones
- 4. Ventricles and cerebral aqueduct inside brain; four cavities known as first, second, third, and fourth ventricles
  - a. Cerebrospinal fluid (CFS) formed by plasma filtering from network of capillaries (choroid plexus) in each ventricle
  - b. CFS circulates throughout ventricles in the brain and subarachnoid space and returns to blood via venous sinuses of brain

## Cranial Nerves

Twelve pairs. (Table 11-1: Distribution and Function of Cranial Nerve Pairs andFigure 11-2: Cranial nerves)

**Table 11-1**  
**Distribution and Function of Cranial Nerve Pairs\***

Name and Number	Distribution	Function
Olfactory (I)	Nasal mucosa, high up along the septum especially	Sense of smell (sensory only)
Optic (II)	Retina of eyeball	Vision (sensory only)
Oculomotor (III)	Extrinsic muscles of eyeball, except superior oblique and external rectus; also intrinsic eye muscles (iris and ciliary)	Eye movements; constriction of pupil and bulging of lens, w hich together produce accommodation for near vision
Trochlear (IV), smallest cranial nerve	Superior oblique muscle of eye	Eye movements
Trigeminal (V) (or trifacial), largest cranial nerve	Sensory fibers to skin and mucosa of head and to teeth; muscles of mastication (sensory and motor fibers)	Sensation in head and face; chew ing movements
Abducens (VI)	External rectus muscle of eye	Abduction of eye
Facial (VII)	Muscles of facial expression; taste buds of anterior two thirds of tongue; motor fibers to submaxillary and sublingual salivary glands	Facial expressions; taste; secretion of saliva
Acoustic (VIII) (vestibulocochlear)	Inner ear	Hearing and equilibrium (sensory only)
Glossopharyngeal (IX)	Posterior third of tongue; mucosa and muscles of pharynx; parotid gland; carotid sinus and body	Taste and other sensations of tongue; secretion of saliva; sw allow ing movements; function in reflex arcs for control of blood pressure and respiration
Vagus (X) (or pneumogastric)	Mucosa and muscles of pharynx, larynx, trachea, bronchi, esophagus; thoracic and abdominal viscera	Sensations and movements of organs supplied; for example, slow s heart, increases peristalsis and gastric and pancreatic secretion; voice production
Spinal accessory (XI)	Certain neck and shoulder muscles (muscles of larynx, sternocleidomastoid, trapezius)	Shoulder movements; turns head; voice production; muscle sense
Hypoglossal (XII)	Tongue muscles	Tongue movements, as in talking; muscle sense

\*NOTE: The first letters of the words in the following sentence are the first letters of the cranial nerves, and many generations of anatomy students have used it as an aid to memorizing the names: “On Old Olympus’ Towering Tops, A Finn and German Viewed Some Hops.” (There are several slightly different versions of the mnemonic.)

**FIGURE 11-2** Cranial nerves. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

## Spinal Cord

### A Structure

1. Inner core of gray matter shaped like a three-dimensional H
2. Long columns of white matter surround cord's inner core of gray matter; namely, right and left anterior, lateral, and posterior columns; composed of numerous sensory and motor tracts

### B Functions

1. Sensory tracts conduct impulses up cord to brain (e.g., spinothalamic tracts, two of the six ascending tracts, conduct sensations of pain, temperature, vibration, and proprioception)
2. Motor tracts (pyramidal and extrapyramidal tracts) conduct impulses down cord from brain (e.g., the two corticospinal tracts decussate, controlling voluntary movement on

side of body opposite the cerebral cortex from which the impulse initiated; three vestibulospinal tracts are involved with some autonomic functions)

3. Gray matter of cord contains reflex centers for all spinal cord reflexes

## Spinal Nerves

A Thirty-one pairs, each containing a dorsal root and a ventral root

B Branches of spinal nerves form intricate networks of fibers (e.g., brachial plexus), from which nerves emerge to supply various parts of skin, mucosa, and skeletal muscles

C All spinal nerves are composed of both sensory dendrites (dorsal root) and motor axons (ventral root)

## Autonomic Nervous System

A Conducts impulses from brainstem or cord out to visceral effectors (e.g., cardiac muscle, smooth muscle, and glands)

B Consists of two divisions

1. Sympathetic (adrenergic fibers) secretes norepinephrine: influences heart, smooth muscle of blood vessels and bronchioles, and glandular secretion

2. Parasympathetic (cholinergic fibers) secretes acetylcholine: influences digestive tract and smooth muscle to promote digestive gland secretion, peristalsis, and defecation; influences heart to decrease rate and contractility

C Autonomic antagonism and summation: sympathetic and parasympathetic impulses tend to produce opposite effects ([Table 11-2: Autonomic Functions](#))

---

### Table 11-2

### Autonomic Functions

---

Autonomic Effector	Effect of Sympathetic Stimulation (Neurotransmitter: Norepinephrine Unless Otherwise Stated)	Effect of Parasympathetic Stimulation (Neurotransmitter: Acetylcholine)
Cardiac Muscle	Increased rate and strength of contraction (beta receptors)	Decreased rate and strength of contraction
<b>Smooth Muscle of Blood Vessels</b>		
Skin blood vessels	Constriction (alpha receptors)	No effect
Skeletal muscle blood vessels	Dilation (beta receptors)	No effect
Coronary blood vessels	Constriction (alpha receptors) Dilation (beta receptors)	Dilation
Abdominal blood vessels	Constriction (alpha receptors)	No effect
Blood vessels of external genitals	Constriction (alpha receptors)	Dilation of blood vessels causing erection
<b>Smooth Muscles of Hollow Organs and Sphincters</b>		
Bronchioles	Dilation (beta receptors)	Constriction
Digestive tract, except sphincters	Decreased peristalsis (beta receptors)	Increased peristalsis
Sphincters of digestive tract	Constriction (alpha receptors)	Relaxation
Urinary bladder	Relaxation (beta receptors)	Contraction
Urinary sphincters	Constriction (alpha receptors)	Relaxation
Reproductive ducts	Contraction (alpha receptors)	Relaxation
<b>Eye</b>		
Iris	Contraction of radial muscle; dilated pupil	Contraction of circular muscle; constricted pupil
Ciliary	Relaxation; accommodates for far vision	Contraction; accommodates for near vision
Hairs (pilomotor muscles)	Contraction produces goose pimples, or piloerection (alpha receptors)	No effect
<b>Glands</b>		
Sweat	Increased sweat (neurotransmitter: acetylcholine)	No effect
Lacrimal	No effect	Increased secretion of tears
Digestive (salivary, gastric, etc.)	Decreased secretion of saliva; not known for others	Increased secretion of saliva
Pancreas, including islets	Decreased secretion	Increased secretion of pancreatic juice and insulin
Liver	Increased glycogenolysis (beta receptors); increased blood glucose level	No effect
Adrenal medulla*	Increased epinephrine secretion	No effect

\*Sympathetic preganglionic axons terminate in contact with secreting cells of the adrenal medulla. Thus, the adrenal medulla functions, to quote someone's descriptive phrase, as a "giant sympathetic postganglionic neuron."

(From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010.)

**D** Under conditions of stress, sympathetic impulses to visceral effectors dominate over parasympathetic impulses; however, in some individuals under stress, parasympathetic impulses via the vagus nerve increase to glands and smooth muscle of the stomach, stimulating hydrochloric acid secretion and gastric motility

## Nerve Impulse Conduction

**A** Sodium-potassium pump: transports sodium out and potassium into cells; requires adenosine triphosphate (ATP) to function

**B** Resting potential: exists when cells are in an unstimulated or resting state

**C** Action potential: composed of depolarization and repolarization; known as the nerve impulse

**D** Reflex arc: pathway to spinal cord and back to effector organ that elicits a single, specific response; primitive nerve activity

**E** Types of neurotransmitters (there are at least 30 types)

1. Monoamines (e.g., norepinephrine, dopamine, serotonin, acetylcholine); axons that release acetylcholine are called cholinergic; those that release norepinephrine are called adrenergic
2. Amino acids (gamma-aminobutyric acid [GABA], glutamic acid, glycine, taurine); GABA is most common inhibitory transmitter in the brain
3. Neuropeptides (e.g., vasopressin, enkephalins, and endorphins); some influence hormone levels and others affect perception and integration of pain and emotional

experience

4. Prostaglandins: some inhibit and some excite; may moderate actions of other transmitters by influencing the neuronal membrane

## Sense Organs

### A Taste

1. Taste buds consist of receptors connected to cranial nerves VII and IX
2. Responds to sweet at tongue tip; sour and salt at tip and sides; bitter at back
3. Olfaction involved in sense of taste

### B Olfaction

1. Receptors in epithelium of nasal mucosa; odors sensed as chemicals interact with receptors on sensory hairs of olfactory cells
2. Olfactory pathways use cranial nerve I

### C Sight

1. Outer layer: sclera and cornea; middle layer: choroid, which includes iris, ciliary body, ciliary muscles, and suspensory ligaments holding the lens; inner layer: retina
2. Anterior cavity contains aqueous humor; posterior cavity contains vitreous humor
3. Extrinsic muscles move eyeball in various directions; intrinsic muscles (e.g., ciliary muscles) control size of pupil and shape of lens, accomplishing accommodation
4. Accessory structures (provide protection): eyebrows, eyelashes, lacrimal apparatus, and eyelids; lined with mucous membrane (conjunctiva) that continues over surface of eyeball; inner and outer canthi at junction of eyelids
5. Physiology of vision
  - a. Refraction, accommodation, and constriction of pupils: necessary to focus image on retina
  - b. Binocular vision: visual fields of two eyes overlap; although each eye sees some areas of the environment that the other eye cannot, both eyes see large areas in common; human brain interprets these overlapping fields in terms of depth; optic chiasm is site of crossover of fibers of optic nerves, permitting binocular vision
  - c. Stimulation of retina: rods considered receptors for night vision; cones are receptors for daylight and color vision; macula lutea, center of retina, receives and analyzes light only from center of visual field and contains fovea centralis where cones are concentrated
  - d. Conduction to visual area in occipital lobe of cerebral cortex by fibers of cranial nerve II and optic tract
6. Errors of refraction
  - a. Myopia (nearsightedness): focuses rays anterior to retina
  - b. Hyperopia (farsightedness): focuses rays posterior to retina
  - c. Astigmatism: irregular curvature of surface of cornea that focuses rays unevenly on retina

### D Hearing

1. External ear: consists of auricle (or pinna), external acoustic meatus (ear opening), and external auditory canal

2. Middle ear: separated from external ear by tympanic membrane; middle ear contains auditory ossicles (malleus, incus, stapes) and openings from eustachian tubes, mastoid cells, external ear, and internal ear
3. Inner ear (or labyrinth)
  - a. Vestibule contains maculae acusticae; vestibular nerve (branch of eighth cranial [acoustic or vestibulocochlear] nerve); provides information about equilibrium, position of head, and acceleration and deceleration
  - b. Semicircular canals contain crista ampullaris, sense organ for sensations of equilibrium and head movements
  - c. Cochlea contains membranous cochlear duct located in organ of Corti, the hearing sense organ; cochlear nerve (branch of eighth cranial nerve) supplies organ of Corti
4. Physiology of hearing
  - a. Sound waves strike tympanic membrane, causing it to vibrate; vibrations sequentially move the malleus, incus, and stapes
  - b. Movement of stapes against oval window starts a ripple in perilymph, which is transmitted to endolymph inside the cochlear duct; this stimulates organ of Corti
  - c. Cochlear nerve conducts impulses from organ of Corti to brain; hearing occurs when impulses reach the auditory area in temporal lobe of cerebral cortex

## ***Structures and Functions of the Muscular System***

A Purpose: movement, posture, and heat production

B Types of muscles and neural control

1. Striated: controlled by voluntary nervous system
2. Smooth: controlled by autonomic nervous system; not under voluntary control
3. Cardiac: control is identical to smooth muscle

C Bursa: synovial fluid-filled sac situated where friction occurs; facilitates movement of tendons over bone, relieving pressure between moving parts

D Tendons: bands of fibrous tissue connecting muscle to bone

E Ligaments: bands of fibrous tissue connecting bone to cartilage; support and strengthen joints

## **Skeletal Muscles**

A Anatomy

1. Muscle fibers coated with fibrous connective tissue (fascia) that binds muscle to surrounding tissues
2. Attached to at least two bones; bone that moves is insertion bone, and bone that is stationary is origin bone
3. Muscle fibers contain myofibrils specialized for contraction; composed of protein myofilaments, containing actin and myosin

B Physiology of muscle contraction

1. Basic principles of muscle contraction

- a. Contract only if stimulated; anything that prevents impulse conduction paralyzes muscles
- b. Skeletal muscles act in groups; classified as prime movers, synergists, or antagonists
- c. Contraction of skeletal muscle either shortens the muscle (producing movement) or increases muscle tension (tone)
  - (1) Tonic contractions: produce muscle tone; there are no muscle movements
  - (2) Isometric contractions: increase degree of muscle tone; daily isometric contractions gradually increase muscle strength; there are no muscle movements
  - (3) Isotonic contractions: muscle is shortened, producing movement
- d. Treppe (staircase phenomenon): when a muscle contracts a few times, subsequent contractions are more powerful
- e. Shivering: rapid, repetitive, involuntary muscle contractions caused by hypothalamic temperature regulating center; most ATP energy is converted to heat, but a small part goes to muscle contraction; consumes large amounts of oxygen

## 2. Energy of muscle contraction

- a. Electrical energy flows along transverse intracellular tubules associated with sarcoplasmic reticulum
- b. Calcium ions released by electrical energy inactivate troponin, which blocks interaction between actin and myosin
- c. Myosin releases and uses energy from ATP to cause contraction
- d. Creatine phosphate replenishes ATP as needed; source of energy is glucose and fatty acids oxidized aerobically to carbon dioxide and water
- e. Anaerobic breakdown of glucose during prolonged and vigorous muscle contraction results in lactic acid buildup associated with fatigue and pain (lactic acidosis); this oxygen debt is reversed during rest or oxygen administration

## 3. Neuromuscular junction

- a. Axon terminal, containing synaptic vesicles, forms a junction with sarcolemma of muscle fiber; tiny synaptic cleft separates presynaptic membrane (axon) from postsynaptic membrane (sarcolemma)
- b. When a nerve impulse reaches an axon terminal, acetylcholine is released from synaptic vesicles into the synaptic cleft; when acetylcholine binds to receptor sites on the sarcolemma, a channel opens and sodium and potassium ions flow down their concentration gradients; the sarcolemma is depolarized, and electrical energy flows into the muscle fiber; cholinesterase inactivates acetylcholine to prevent static contraction

## 4. Changes in muscle mass

- a. Hypertrophy: physical enlargement of muscle resulting from increase in cellular components; muscle fibers do not divide to produce more fibers
- b. Atrophy: wasting of muscle resulting from a variety of factors (e.g., diminished cellular proliferation, death of cells, decreased activity, hormonal changes)

c. Hyperplasia: proliferation of normal cells, increasing the volume of tissue

## ***Structures and Functions of the Skeletal System***

### **A Purpose**

1. Provides supporting framework; protects viscera and brain
2. Bones serve as levers and joints as fulcrums
3. Hemopoiesis by red bone marrow: formation of all blood cells; some lymphocytes and monocytes are formed in lymphatic tissue
4. Mineral storage: calcium, phosphorus, and sodium

B Skeleton: contains 206 bones

### **C Joint: junction of two or more bones**

1. Synarthrotic (fibrous): generally nonmovable; no joint cavity or capsule; bones held together by fibrous tissue (e.g., sutures)
2. Amphiarthrotic (cartilaginous): slightly movable; no joint cavity or capsule; bones held together by cartilage and ligaments (e.g., symphysis pubis)
3. Diarthrotic: freely movable; lined by layer of hyaline cartilage covering articular surfaces of joining bones; held together by fibrous capsule lined with synovial membrane and ligaments
  - a. May be ball and socket (e.g., hip), hinge (e.g., elbow), condyloid (e.g., wrist), pivot, gliding, or saddle
  - b. Movement depends on type of joint
    - (1) Flexion: bending one bone on another, decreasing angle between adjacent bones
    - (2) Extension: stretching one bone away from another, increasing angle between adjacent bones
    - (3) Abduction: moving bone away from body's midline
    - (4) Adduction: moving bone toward body's midline
    - (5) Rotation: pivoting bone on its axis
    - (6) Internal rotation: turning of a limb toward midline of body
    - (7) External rotation: turning of a limb away from midline of body
    - (8) Circumduction: circular movement of a limb
    - (9) Supination: forearm movement turning palm forward or upward
    - (10) Pronation: forearm movement turning palm backward or downward
    - (11) Inversion: ankle movement turning sole of the foot inward
    - (12) Eversion: ankle movement turning sole of the foot outward
    - (13) Protraction: moving a part forward, such as lower jaw
    - (14) Retraction: pulling a part back; opposite of protraction
    - (15) Plantar flexion: pointing toes downward away from body
    - (16) Dorsiflexion: pointing toes upward toward body

### **D Variations in skeletons**

1. Male skeleton larger and heavier than female skeleton
2. Male pelvis deep and funnel shaped with narrow, pubic arch; female pelvis shallow, broad, and flaring with wider pubic arch

3. From infancy to adulthood: bones grow and their relative sizes change partly due to stimulation by somatotrophic hormone (e.g., torso becomes proportionately larger to head, pelvis becomes relatively larger, and legs proportionately longer)
4. From young adulthood to old age: bone margins and projections change gradually; marginal lipping and spurs occur, thereby restricting movement
5. Demineralization results in a reduction of bone mass per unit of volume (osteoporosis); mostly occurs in postmenopausal women; related to decreased hormone production, lack of exercise that stresses skeleton, and inadequate intake of calcium, magnesium, and vitamins A, C, and D

## **Bone Formation**

### **A Ossification process**

1. Types of bone: cancellous (spongy) and compact (dense)
2. Formation of bone matrix (intercellular substance of bone): consist of collagen fibers and a cementlike ground substance; osteoblasts (bone-forming cells) synthesize collagen and cement substance from dietary proteins; exercise and estrogens stimulate osteoblasts to form bone matrix
3. Calcification of bone matrix: calcium salts deposit in bone matrix
4. Balance of osteoblastic (bone building) and osteoclastic (bone resorption) activity continuously turns over bone tissue; osteopenia and osteoporosis occur when osteoclastic activity is greater than osteoblastic activity

### **B Nutrients required for growth, maintenance, and remodeling of bone**

1. Vitamin A: promotes chondrocyte function and synthesis of lysosomal enzymes for osteoclast activity
2. Vitamin C: promotes synthesis of collagen and bone matrix
3. Vitamin D: promotes calcium and phosphorus absorption
4. Calcium: needed to form calcium phosphate and hydroxyapatite
5. Magnesium: important enzyme activator in mineralization process
6. Phosphorus: needed to form calcium phosphate and hydroxyapatite

### **C Repair of bone**

1. When bone is fractured, connective tissue grows into and around fracture (callus)
2. Macrophages reabsorb damaged/dead cells
3. Osteoclasts dissolve bone fragments
4. Osteoblasts produce new bone substance and fuse bone together
5. Final bone shape slowly remodeled; complete process takes several months; slower than epithelial tissue, which has a higher metabolic rate and richer blood supply

## **Review of Physical Principles**

**A Lever:** rigid bar that moves about a fixed point known as the fulcrum; a small force is applied through a large distance, and the other end of the lever exerts a large force over a small distance; related to effective body mechanics

**B Pulleys:** can multiply force at expense of distance; used in traction

## C Center of gravity

1. Area of body where majority of weight is located; in a human the center of gravity is the pelvic cavity; pelvic cavity should be over the base of support for stability and balance
2. When bending over, body's center of gravity shifts from a stable position between the legs to an unstable position outside the legs; keeping legs apart widens base of support

D Buoyancy of water: reduces energy to move muscles or objects against the force of gravity

E Pascal's principle: when pressure is applied to fluid in a closed, nonflexible container, it is transmitted undiminished throughout all parts of the fluid and acts in all directions (e.g., brain tumor and hydrocephalus); increasing pressure causes pain

F Electromagnetic fields: strong magnetic field (e.g., magnetic resonance imaging [MRI]) or high-energy electromagnetic radiation (e.g., x-ray, computed tomography [CT]) used to diagnose abnormalities

## G Sound

1. Mechanical vibration progresses better through solids and liquids than through gases (e.g., bowel sounds, breath sounds)
2. Ultrasonic vibrational frequencies exceeding upper level of human hearing
  - a. Low-intensity ultrasonic waves: used to treat arthritis and bursitis, break kidney stones, and help dissolve scars
  - b. Sonograms: pictures derived through differential reflection or transmission of sound waves; used as a diagnostic tool
3. Hearing aids: electronic devices that amplify sounds to assist the hearing impaired
  - a. Air-conduction type sends an amplified sound wave into ear, thus using person's own middle ear
  - b. Bone-conduction type bypasses middle ear and transmits amplified vibrations to skull bones, which in turn produces vibrations in inner ear

# Review of Microorganisms

## A Bacterial pathogens

1. *Clostridium tetani*: large, gram-positive, motile bacillus forming large terminal spores; an obligate anaerobe; causes tetanus (lockjaw)
2. *Neisseria meningitidis*: gram-negative diplococcus; causes epidemic (meningococcal) meningitis
3. *Borrelia burgdorferi*: transmitted by tick bite; causes Lyme disease

B DNA viruses: varicella (chickenpox), herpes zoster (shingles), infectious mononucleosis, and cytomegalic inclusion disease

C RNA viruses: mostly borne by mosquitoes and ticks; cause eastern equine encephalomyelitis, western equine encephalomyelitis, and Venezuelan equine encephalomyelitis

D Nematode: *Trichinella spiralis*: small parasitic nematode; causes trichinosis

## Related Pharmacology

### ***Anticonvulsants (Antiseizure, Antiepileptic Medications)***

#### A Description

1. Modify bioelectric activity at subcortical and cortical sites by stabilizing nerve cell membranes and/or raising seizure threshold to incoming stimuli
2. Decrease occurrence, frequency, and/or severity of seizure episodes
3. Available in oral and parenteral (IM, IV) preparations
4. Generic substitutes are not interchangeable; formulations vary

#### B Examples

1. Hydantoins: used for tonic-clonic (formerly grand mal) and psychomotor seizures; phenytoin (Dilantin), fosphenytoin
2. Barbiturates: used for tonic-clonic and partial seizures; phenobarbital, primidone (Mysoline)
3. Benzodiazepines: used as anticonvulsant and antianxiety agents; for status epilepticus — diazepam (Valium), lorazepam (Ativan); for absence (formerly petit mal) seizures — clonazepam (Klonopin)
4. Succinimides: used for absence seizures; ethosuximide (Zarontin), methsuximide (Celontin)
5. Gamma-aminobutyric acid (GABA) analogs: used for partial seizures; to control pain of herpes zoster (shingles) and other neurologic disorders; gabapentin (Neurontin), pregabalin (Lyrica)
6. Carboxamides: used for tonic-clonic and psychomotor seizures; to control pain of trigeminal neuralgia and other neurologic disorders; carbamazepine (Tegretol), oxcarbazepine (Trileptal)
7. Valproates: used for absence seizures; valproic acid (Depakene), divalproex sodium (Depakote)

#### C Major side effects

1. Dizziness, drowsiness (CNS depression), paresthesia
2. Nausea, vomiting (irritation of gastric mucosa)
3. Skin rash (hypersensitivity)
4. Blood dyscrasias (decreased RBCs, WBCs, platelet synthesis)
5. Hepatotoxicity
6. Phenytoin: ataxia (neurotoxicity); gingival hyperplasia (gum irritation leading to tissue overgrowth); hirsutism (virilism); hypotension (decreased atrial and ventricular conduction); reddish brown urine; therapeutic serum level is 10 to 20 mcg/mL

#### D Nursing care

1. Administer with food to reduce GI irritation
2. Instruct client
  - a. Avoid alcohol and other CNS depressants
  - b. Notify health care provider if fever, sore throat, skin rash, unusual bleeding, loss of balance, or a seizure occur
  - c. Carry medical alert card

- d. Avoid abrupt discontinuation; dose must be tapered
3. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent possible drug-induced deficiencies of folic acid, calcium, and vitamin D
4. Instruct to review other medications, supplements, and herbal remedies with health care provider and pharmacist because of drug interactions (e.g., phenytoin increases metabolism of oral contraceptives and anticoagulants; ginkgo biloba may decrease phenytoin's effectiveness as an anticonvulsant)
5. Monitor for therapeutic blood levels
6. Teach safety precautions
7. Care for clients receiving phenytoin (Dilantin)
  - a. Avoid mixing with other IV infusions; incompatible with 5% dextrose
  - b. Provide oral hygiene; inspect oral mucosa for infection and gingival hyperplasia
  - c. Assess for initial potentiation of anticoagulant effect followed by inhibition
  - d. Assess urine; drug may discolor urine pink to red-brown
  - e. Assess for tissue necrosis because phenytoin is irritating to veins

## ***Osmotic Diuretics***

### **A Description**

1. Reduce cerebral edema and intraocular pressure by increasing osmotic pressure within vasculature, thus causing fluid to leave tissues and be excreted in urine
2. Available in parenteral (IV) preparations

### **B Example: mannitol (Osmitrol)**

### **C Major side effects**

1. Headache (dehydration)
2. Nausea (fluid and electrolyte imbalance)
3. Chills (fluid and electrolyte imbalance)
4. Rebound edema when discontinued (fluid and electrolyte imbalance)
5. Fluid/electrolyte imbalances (hyponatremia and hypokalemia resulting from promotion of sodium and potassium excretion)

### **D Nursing care**

1. Administer intravenously through a filter
2. Monitor I&O, daily weight, and serum electrolytes
3. Question prescription if client has heart failure or impaired renal function
4. Elevate head of bed during therapy
5. Assess for signs of increased intracranial pressure (e.g., decreasing pulse rate, widening pulse pressure, increasing systolic pressure, unequal or dilated pupils, change in level of consciousness, vomiting)

## ***Calcium Enhancers***

### **A Description**

1. Calcium ion replacement directly increases serum calcium concentration

2. Vitamin D replacement improves absorption of calcium from intestines
3. Bisphosphonates absorb calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone; inhibit resorption of bone by osteoclast; studies have indicated that they may decrease risk of invasive breast cancer
4. Parathyroid agents decrease bone resorption
5. Hormone replacement therapy ([Chapter 23](#), Nursing Care to Promote Childbearing and Women's Health, Related Pharmacology, Estrogens; and [Chapter 24](#). Nursing Care Related to Major Disorders Affecting Women's Health, Osteoporosis)

#### B Examples

1. Calcium ion replacement: calcium carbonate (Os-Cal); calcium chloride; calcium gluconate (Kalcinate)
2. Vitamin D replacement: calcitriol (Rocaltrol), cholecalciferol (Calciferol)
3. Bisphosphonates: prescribed daily, weekly, monthly, or yearly depending on medication and client's condition; Oral drugs: alendronate (Fosamax), risedronate (Actonel), ibandronate (Boniva); IV drugs: pamidronate (Aredia), zoledronic acid (Reclast)
4. Parathyroid agents: nasal spray or injection—calcitonin (Miacalcin); Sub-Q—teriparatide (Forteo)

#### C Major side effects

1. Nausea, vomiting, renal calculi, muscle flaccidity (hypercalcemia)
2. Constipation (increased serum calcium level delays passage of stool)
3. Calcium preparations: cardiac disturbances (stimulation of cardiac conduction)
4. Vitamin D: dry mouth; metallic taste (early vitamin D toxicity associated with hypercalcemia)
5. Bisphosphonates: bone pain, headache, abdominal pain, nausea
6. Parathyroid agents: diarrhea, urinary frequency, headache, chest pressure, and dyspnea

#### D Nursing care

1. Assess for signs of hypercalcemia and tetany
2. Monitor levels of serum electrolytes during course of therapy
3. Encourage increased fluid intake to reduce potential of renal calculi and constipation; stress vitamin D and calcium-rich foods (e.g., eggs, cheese, whole grain cereals, and cranberries); limit milk, fruits, and vegetables
4. Calcium preparations: assess for potentiation of digitalis effect
5. Oral bisphosphonates: instruct to take on empty stomach with a full glass of water and to remain upright for 30 to 60 minutes; can cause esophageal ulcers

## **Antiparkinson Agents**

#### A Description

1. Anticholinergic drugs act at central sites to inhibit cerebral motor impulses and block efferent impulses that cause muscular rigidity
2. Dopaminergic agents: supply or cause release of dopamine required for norepinephrine synthesis and maintenance of neurohormonal balance at subcortical,

cortical, and reticular sites that control motor function

3. Catechol O-methyltransferase (COMT) inhibitors: deter enzymes involved in breakdown of levodopa, thereby prolonging duration of action of levodopa in CNS
4. Monoamine oxidase B (MAO-B) inhibitor: exerts neuroprotective effect
5. Antiviral agent: potentiates action of dopamine

#### B Examples

1. Anticholinergic: benztropine mesylate (Cogentin)
2. Dopaminergic agents: carbidopa-levodopa (Sinemet), carbidopa-levodopa-entacapone (Stalevo); DOPamine receptor agonists—bromocriptine (Parlodel), ropinirole (Requip), pramipexole (Mirapex)
3. COMT inhibitors: entacapone (Comtan), tolcapone (Tasmar)
4. MAO (Monoamine Oxidase)-B inhibitor: selegiline (Eldepryl)
5. Antiviral agent: amantadine

#### C Major side effects

1. Anticholinergic drugs (decrease parasympathetic stimulation)
  - a. Dry mouth (decreased salivation)
  - b. Blurred vision (pupillary dilation); contraindicated with narrow-angle glaucoma
  - c. Constipation (decreased peristalsis)
  - d. Urinary retention (decreased muscle tone)
2. Other drugs
  - a. Orthostatic hypotension (loss of compensatory vasoconstriction with position change)
  - b. Ataxia, involuntary movements, blepharospasm (neurotoxicity)
  - c. CNS disturbances and emotional disturbances including suicidal ideation (CNS effect)
  - d. Nausea, vomiting (irritation of gastric mucosa)
  - e. Bone marrow depression
  - f. Dopaminergics: neuroleptic malignant syndrome (e.g., muscle rigidity, fever, mental status changes, unstable blood pressure)

#### D Nursing care

1. Instruct client
  - a. Avoid discontinuing drug suddenly
  - b. Treatment controls symptoms but is not a cure
  - c. Continue health supervision
  - d. Take COMT inhibitors in conjunction with dopaminergic agents or they will be ineffective
2. Offer emotional support; therapy usually is life-long
3. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent drug-induced nutrient deficiencies
4. Care for client receiving anticholinergic drugs
  - a. Suggest sugar-free chewing gum and hard candy to increase salivation
  - b. Teach to avoid potentially hazardous activities because of drug's CNS effects

- c. Teach to increase fluids, roughage, and activity to prevent constipation
- d. Monitor for urinary retention

5. Care for the client receiving carbidopa-levodopa

- a. Monitor complete blood count (CBC), renal and hepatic function
- b. Teach to limit or eliminate vitamin B<sub>6</sub> from diet (e.g., pork, veal, lamb, potatoes, legumes, oatmeal, wheat germ) because it decreases effectiveness of the drug
- c. Inform client regarding dosage and “holiday” periods
- d. Instruct client and family to monitor for extrapyramidal effects (e.g., unsteady gait, involuntary movements)
- e. Instruct client and family to report signs and symptoms of neuroleptic malignant syndrome
- f. Instruct to maintain safety (e.g., change positions slowly to avoid orthostatic hypotension, avoid driving or use of heavy machinery)

6. Care for the client receiving selegiline

- a. Inform that selegiline may be started early in the course of the disease because neuroprotective actions are expected
- b. Teach safety precautions because drug can cause orthostatic hypotension
- c. Instruct to avoid foods containing tyramine (e.g., wine, cheese, and chocolate) because their ingestion with this monoamine oxidase inhibitor (MAOI) can cause a severe hypertensive crisis

## ***Cholinesterase Inhibitors***

### **A Description**

- 1. Prevent enzymatic breakdown of acetylcholine at nerve endings, thus allowing accumulation of the neurotransmitter
- 2. Improve strength of contraction in all muscles, including those involved with respirations
- 3. Used to diagnose and treat myasthenia gravis
- 4. Available in oral and parenteral (IM, IV) preparations

**B Examples:** edrophonium (Enlon, Tensilon) (used for diagnostic purposes; extremely short acting), neostigmine (Prostigmin), pyridostigmine (Mestinon), ambenonium (Mytelase)

### **C Major side effects**

- 1. Nausea, vomiting (irritation of gastric mucosa)
- 2. Abdominal cramps, diarrhea, hypersalivation, hypotension, bradycardia, miosis (increased parasympathetic stimulation)
- 3. Muscle cramps (increased skeletal muscle contraction)
- 4. Seizures (CNS effect)
- 5. Acute toxicity: profound muscle weakness, pulmonary edema, bronchial constriction, and respiratory failure (cholinergic crisis); must be differentiated from myasthenic crisis with edrophonium test

### **D Nursing care**

- 1. Administer on time exactly as prescribed; monitor client response; dosage is adjusted

according to needs

2. Have atropine sulfate available for treatment of overdose
3. Administer with food to reduce GI irritation
4. Instruct client
  - a. Carry a medical alert card
  - b. Take medication before meals to improve chewing and swallowing
  - c. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent drug-induced nutrient deficiencies
  - d. Report respiratory distress immediately

## ***Skeletal Muscle Relaxants***

### A Description

1. Central agents: depress CNS to promote relaxation of voluntary muscles
2. Peripheral agents: block nerve impulse conduction at the myoneural junction
3. Relieve muscle spasms
4. Available in oral and parenteral (IM, IV) preparations

B Examples: carisoprodol (Soma); cyclobenzaprine (Flexeril); diazepam (Valium); Methocarbamol; baclofen (Lioresal)

### C Major side effects

1. Dizziness, drowsiness (CNS depression)
2. Nausea (irritation of gastric mucosa)
3. Headache (central antimuscarinic effect)
4. Tachycardia (brainstem stimulation)

### D Nursing care

1. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent drug-induced nutrient deficiencies
2. Teach client receiving central agents to use safety precautions during initial therapy and to avoid engaging in potentially hazardous activities or using alcohol and other CNS depressants

## ***Nonsteroidal Antiinflammatory Drugs (NSAIDs)***

### A Description

1. Interfere with prostaglandin synthesis
2. Alleviate inflammation and subsequent discomfort of rheumatoid conditions
3. Available in oral and parenteral (IM) preparations

### B Examples

1. Older NSAIDs: diclofenac (Voltaren); etodolac (Lodine); ibuprofen (Advil, Motrin); Naproxen (Aleve, Naprosyn); salicylates (aspirin); ketorolac (Toradol)
2. Newer NSAIDs: COX-2 inhibitors—celecoxib (Celebrex), nabumetone (Relafen); cause less GI irritation

### C Major side effects

1. GI ulceration, tarry stools (melena)
2. Skin rash (hypersensitivity)
3. Blood dyscrasias (e.g., decreased RBCs, WBCs, platelet synthesis)
4. CNS and genitourinary (GU) disturbances
5. Increased liver enzymes
6. COX-2 inhibitors: potentially fatal cardiovascular thrombotic events increase with duration of use

### D Nursing care

1. Administer with meals to reduce GI irritation; instruct to avoid other gastric irritants such as alcohol and smoking
2. Monitor coagulation and liver profiles
3. Assess vital signs; may increase BP
4. Instruct to report side effects such as bleeding or hearing disturbance; aspirin toxicity affects cranial nerve VIII causing tinnitus
5. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent drug-induced nutrient deficiencies; restrict sodium intake to limit fluid retention

## **Antigout Agents**

### A Description

1. Decrease uric acid formation and increase its excretion
2. Prevent and arrest gout attacks caused by high levels of uric acid in blood
3. Available in oral and parenteral (IV) preparations

### B Examples

1. Allopurinol (Zyloprim): blocks formation of uric acid
2. Colchicine (Colsalide, Colcrys): decreases uric acid crystal deposits by inhibiting lactic acid production; effective for acute attacks
3. Probenecid (Benemid): prevents formation of tophi by inhibiting reabsorption of uric acid by kidneys

### C Major side effects

1. Nausea, vomiting, diarrhea (irritation of gastric mucosa)
2. Blood dyscrasias (decreased RBCs, WBCs, and platelet synthesis)
3. Liver damage (hepatotoxicity)
4. Skin rash (hypersensitivity)

### D Nursing care

1. Administer prescribed antiinflammatory drugs (e.g., prednisone [Meticorten], indomethacin [Indocin]) to work in concert with antigout medications during acute phase
2. Increase fluids to discourage formation of renal calculi
3. Encourage weight reduction if overweight
4. Monitor serum blood uric acid level to determine effectiveness of treatment; compare to normal levels for males (4.0 to 8.5 mg/dL) or females (2.7 to 7.3 mg/dL)

5. Administer with meals to reduce GI irritation
6. Instruct to avoid high-purine foods (e.g., organ meats, anchovies, sardines, and shellfish); encourage diet rich in nutrient-dense foods (fruits, vegetables, and whole grains as well as milk, cheese, and eggs); teach importance of preventing drug-induced nutrient deficiencies

## ***Ophthalmic Agents***

### A Description

1. Produce a variety of actions (e.g., constriction, dilation, antiinflammatory, antiinfective)
2. Diagnose and treat conditions affecting eyes
3. Available in a variety of topical preparations; systemic acting medications are available in oral and parenteral (IM, IV) preparations

### B Examples

1. Miotics: constrict pupil, pulling iris away from the filtration angle and improving outflow of aqueous humor; treat chronic open-angle glaucoma
  - a. Beta-blocker miotics: betaxolol (Betoptic), timolol (Timoptic, Cosopt)
  - b. Cholinergic miotics: carbachol (Miostat)
2. Mydriatics: dilate pupil (mydriasis) by contracting dilator muscle of iris with minimal effect on the ciliary muscle; lessens effect on accommodation
  - a. Anticholinergics (relax ciliary muscle) and cycloplegic agents (paralyze accommodation); used to facilitate eye examinations and surgery
  - b. Atropine; tropicamide (Mydriacyl, Tropicacyl); cyclopentolate (Cyclogyl); dipivefrin (Propine)
3. Carbonic anhydrase inhibitors
  - a. Decrease production of aqueous humor to control intraocular pressure
  - b. Acetazolamide (Diamox); brinzolamide (Azopt); dorzolamide (Trusopt)
4. Osmotic agents
  - a. Administered systemically to increase blood osmolality, which mobilizes fluid from eye to reduce volume of intraocular fluid; decrease intraocular pressure in glaucoma and corneal edema
  - b. Mannitol (Osmitrol)
5. Corticosteroids
  - a. Administered topically to decrease inflammatory response
  - b. Dexamethasone (Decadron) and prednisolone (AK-Pred, Blephamide)

### C Major side effects

1. Miotics
  - a. Twitching eyelids, brow ache (increased cholinergic stimulation)
  - b. Headache (vasodilation)
  - c. Conjunctival pain (conjunctival irritation)
  - d. Contact dermatitis (local irritation)
2. Mydriatics
  - a. Dry mouth (decreased salivation)

- b. Flushing, fever, ataxia (CNS effect)
- c. Blurred vision, photophobia (pupillary dilation)
- d. Skin rash (hypersensitivity)
- e. Tachycardia (decreased vagal stimulation)

### 3. Carbonic anhydrase inhibitors

- a. Diuresis (increased excretion of sodium and water in renal tubule); metabolic acidosis
- b. Paresthesia (fluid/electrolyte imbalance)
- c. Bone marrow depression
- d. CNS disturbances (CNS effect)

### 4. Osmotic agents

- a. Headache (cerebral dehydration)
- b. Nausea, vomiting (fluid/electrolyte imbalance)

### 5. Corticosteroids

- a. Blurred vision
- b. Increased intraocular pressure

### D Nursing care

1. Instruct client regarding administration technique (e.g., hand hygiene before instilling drops, placing medication in conjunctival sac, applying pressure on lacrimal duct during instillation to prevent systemic absorption, avoiding squeezing eyes shut, wiping from inner to outer canthus)
2. Assess for side effects and/or worsening of condition
3. Provide care for client receiving mydriatics: caution that vision will be blurred temporarily; advise that sunglasses will limit photophobia; caution about engaging in hazardous activities
4. Encourage continued health care supervision

## Related Procedures

### ***Computed Tomography (CT)***

#### A Definition

1. Cross-sectional visualization of the head or other body cavity determined by computer analysis of relative tissue density as an x-ray beam passes through body
2. Provides three-dimensional information about location and extent of tumors, infarcted areas, atrophy, and vascular lesions
3. May be done with IV injection of contrast agent for enhanced visualization

#### B Nursing care

1. Explain procedure; it will be necessary to lie still and equipment is complex but will cause no discomfort; infants and cognitively impaired or anxious clients may need sedation
2. Obtain informed consent
3. If contrast is planned, assess for allergy to iodine, a component of contrast material; inform that if a contrast medium is used there may be a feeling of warmth, facial

flushing, and a salty taste in the mouth

4. Withhold food for approximately 2 hours before contrast testing; dye may cause nausea in sensitive clients
5. Remove wigs, clips, and pins before CT of head
6. Assess for untoward effects such as hypersensitivity reactions (e.g., palpitations, respiratory distress, headache)
7. Encourage fluids after procedure if contrast agent is used
8. Critically ill clients may need continuous monitoring and nursing care during the procedure

## ***Magnetic Resonance Imaging (MRI)***

### **A Definition**

1. Uses magnetic fields and radio waves to produce cross-sectional images
2. Produces accurate images of blood vessels, bone marrow, gray and white brain matter, spinal cord, globe of eye, heart, abdominal structures, and breast tissue; can monitor blood velocity; particularly useful for diagnosing multiple sclerosis

### **B Nursing care**

1. Explain procedure; obtain informed consent
2. Screen for ability to withstand confining surroundings (claustrophobia) because client must remain in the tunnel-like machine for up to 90 minutes; sedation may be required; open MRI may be an option for those who cannot tolerate closed spaces
3. Instruct to lie still, expect a series of intermittent thumping sounds, and communicate via microphone located in scanner
4. Remove jewelry, clothing with metal fasteners, dentures, hearing aids, glasses, any transdermal patches with foil layers before entering scanner, and medical equipment from room (e.g., intravenous pumps, oxygen tank, portable monitoring machines)
5. Review history for contraindications: orthopedic hardware, pacemaker, artificial heart valves, or other implants that may be dislodged or malfunction as a result of the magnetic field; keep area free of metal objects; arrange for supplemental oxygen beforehand because oxygen tanks cannot enter room

## ***Lumbar Puncture***

### **A Definition**

1. Introduction of a needle into subarachnoid space below spinal cord, usually between L3 and L4 or between L4 and L5
2. Withdrawal of cerebral spinal fluid (CSF) for diagnostic purposes or to reduce spinal pressure (usually 70 to 200 cm H<sub>2</sub>O)
3. Measurement of spinal pressure: Queckenstedt test involves compression of the jugular veins; pressure should rise; but if blockage exists, pressure will not rise
4. Injection of medication such as anesthetics

### **B Nursing care**

1. Explain procedure; obtain informed consent

- 2. Assist to a position that will enlarge opening between vertebrae
  - a. Lying on side with feet drawn up and head lowered to chest; back near edge of mattress
  - b. Sitting on side of bed, leaning on stationary overbed table, feet supported on a flat surface
- 3. Prevent postlumbar puncture headache: maintain in prone position for 2 hours; flat side-lying for 2 to 3 hours; and then avoid elevating head for 6 more hours
- 4. Label specimens and send to laboratory; document color and amount of fluid
- 5. Assess immediate response for signs of shock and complications such as CSF leakage, infection, and brain herniation if a space-occupying lesion is present; prolonged headaches may indicate leakage of CSF
- 6. Administer fluids unless contraindicated

**Positron Emission Tomography (PET)**

A Definition

- 1. Strong radioactive tracers emit signals; computer analysis of emitted gamma rays forms images
- 2. Determines blood flow, glucose metabolism, and oxygen extraction
- 3. Effective in diagnosis of brain attack, brain tumors, epilepsy; can evaluate progress of Alzheimer disease, Parkinson disease, bipolar disorders, and head injuries

B Nursing care

- 1. Explain procedure; obtain informed consent
- 2. Maintain NPO 4 hours before test
- 3. Explain importance of lying still for about 45 minutes; sedation may be needed

**Neurologic Assessment (Including Glasgow Coma Scale)**

A Definition

- 1. Systematic evaluation of cranial nerves, motor and sensory functioning, and mental status to detect neurologic abnormalities
- 2. Screening tools assess critical aspects of a complete neurologic evaluation (e.g., neuro checklist, Glasgow Coma Scale) ([Table 11-3: Glasgow Coma Scale](#))

**Table 11-3**  
**Glasgow Coma Scale**

Assessed Behavior	Adult Criteria	Infant and Young Child Criteria	Score
Eye opening	Spontaneous opening	Spontaneous opening	4
	To verbal stimuli	To loud noise	3
	To pain	To pain	2
	No response	No response	1
Verbal response	Oriented to appropriate stimulation	Smiles, coos, cries	5
	Confused	Irritable, cries	4
	Inappropriate words	Inappropriate crying	3
	Incoherent	Grunts, moans	2
	None	No response	1
Motor response	Obeys commands	Spontaneous movement	6
	Localizes pain	Withdraws to touch	5
	Withdraws from pain	Withdraws to pain	4
	Flexion to pain (decorticate)	Abnormal flexion (decorticate)	3
	Extension to pain (decerebrate)	Abnormal extension (decerebrate)	2
	None	No response	1

\*Add the numbers from each category. Maximum score = 15. Minimum score = 3.

(Modified from Teasdale G, Jennett B: Assessment of coma and impaired consciousness: a practical scale, *Lancet* 2:81-84, 1974; James HE: Neurologic evaluation and support of the child with acute brain insult, *Pediatr Ann* 15:17, 1986.)

## B Nursing care

### 1. Assess cranial nerves (see [Table 11-1](#) and [Figure 11-2](#))

- Olfactory (I): ability to identify familiar odors such as mint or alcohol with eyes closed and one nostril occluded at a time
- Optic (II): visual acuity measured by use of Snellen chart or by gross estimation with reading material; gross comparison of visual fields with those of examiner; color perception
- Oculomotor (III), trochlear (IV), and abducent (VI): ability of pupils to react equally to light and to accommodate to varying distances; range of extraocular movement (EOM) evaluated by asking client to follow a finger or object with eyes; also assess for nystagmus (jerking motion of eyes), particularly when eyes are directed laterally
- Trigeminal (V): sensations of face evaluated by lightly stroking cotton across

forehead, chin, and cheeks while client's eyes are closed; ability to clench teeth (jaw closure)

- e. Facial (VII): symmetry of facial muscles as client speaks or is asked to make faces
- f. Acoustic or vestibulocochlear (VIII): hearing acuity determined by a watch tick or whispered numbers; Weber test may be performed by holding the stem of a vibrating tuning fork at midline of skull (should be heard equally in both ears)
- g. Glossopharyngeal (IX) and vagus (X): uvula should hang in midline; swallow and gag reflexes should be intact
- h. Spinal accessory (XI): symmetric ability to turn head or shrug shoulders against counterforce of examiner's hands
- i. Hypoglossal (XII): ability to protrude tongue without deviation, to left or right, and without tremors

2. Assess motor function (including cerebellar function)

a. Balance

(1) Observation of gait

(2) Romberg test: positive if client fails to maintain an upright position with feet together with closed eyes

b. Coordination: ability to touch finger to nose when arms are extended or to perform similar tasks smoothly

c. Muscle strength: evaluated by having client move symmetrical muscle groups against opposition supplied by examiner

3. Assess sensory function: bilateral testing of response to light touch with cotton, sharp versus dull stimuli, vibration of a tuning fork

4. Assess mental status (cerebral functioning)

a. Level of consciousness: determined by response to stimuli (verbal, tactile, or painful)

b. Orientation to person, place, and time: determined by general conversation and direct questioning

c. Judgment, memory, and ability to perform simple calculations

d. Appropriateness of behavior and mood

5. Assess reflexes

a. Deep tendon reflexes (biceps, triceps, patellar, Achilles) with a reflex hammer; classification from 0 (absent) to 4+ (hyperactive); 2+ is expected

b. Plantar: plantar flexion of foot when sole is stroked firmly with a hard object such as a tongue blade; abnormal adult response (dorsiflexion of foot and fanning of toes) is reported as a positive Babinski reflex and is indicative of corticospinal tract disease

c. Oculocephalic (doll's eyes movements): when head of comatose client is turned to side, eyes should move in opposite direction; absence of reflex suggests brainstem injury; eliciting this response is contraindicated when client has a neck injury

d. Oculovestibular (caloric test): when warm or ice water is instilled into ear of a comatose client, nystagmus occurs; eyes should deviate toward stimulated ear if ice water is used and away with warm water; absence of reflex suggests brainstem

damage; performing this test is contraindicated if eardrum is perforated

6. Assess posturing ([Figure 11-3: Types of posturing](#))

**FIGURE 11-3** Types of posturing. **A**, Flexion (Decorticate). **B**, Extension (Decerebrate). (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

7. Document findings; report any deviations
8. Explain to and reassure client and family when assessments must be repeated frequently
9. Coordinate other care with frequent neurologic assessments to promote rest between assessments

## **Continuous Passive Motion (CPM) Device**

### **A Definition**

1. Machine that provides passive range of motion, most commonly for the knee
2. Moves joint without weight-bearing or straining muscles after orthopedic surgery
3. Stimulates regeneration of articular tissues or maintains/increases range of motion

### **B Nursing care**

1. Align extremity in padded CPM device
2. Set foot cradle at the prescribed angle
3. Adjust device according to length of physical therapist extremity
4. Set flexion, extension, and speed dials as ordered; increased gradually as tolerated to maximize mobility
5. Demonstrate how to use control cord

6. Ensure pain control measures are implemented before procedure

## ***Braces or Splints***

### A Definition

1. Immobilize and protect diseased or injured joint
2. Support and protect weakened muscles
3. Prevent and correct anatomic deformities
4. Aid in controlling involuntary muscle movements
5. Aid in ambulating for those with physical impairments

### B Nursing care

1. Keep equipment in repair (e.g., oil joints, replace straps when worn)
2. Ensure adequate shoes (e.g., heels low and wide, high top to hold heel in shoe)
3. Examine skin daily for evidence of breakdown at pressure points
4. Check alignment of braces (e.g., leg brace: joints coincide with body joints; back brace: upright bars in center of back, brace should grip pelvis and trochanter firmly, lacing should begin from bottom)
5. Coordinate with physical therapist for appropriateness of assistive devices

## ***Mobility: Assistive Devices***

### A Purposes

1. Relieve pressure on weight-bearing joints
2. Improve or maintain stability of client with a lower limb disability to prevent injury
3. Provide security while developing confidence in ambulating
4. Assist in increasing speed of ambulation with less fatigue
5. Provide for greater mobility and independence

### B Nursing care: use of a cane

1. Ascertain ability to bear weight on affected extremity
2. Ensure ability to use upper extremity opposite affected lower extremity
3. Types: straight cane has one leg and provides least support; quad cane has 4 legs and has a broader base of support
4. Measure to determine length of cane required: highest point should be approximately level with greater trochanter; hand piece should allow 30 degrees of flexion at elbow, with wrist held in extension
5. Explain techniques when using a cane
  - a. Hold in hand opposite affected extremity and close to body
  - b. Advance cane and affected extremity simultaneously, and then unaffected leg
  - c. When climbing, step up with unaffected extremity and then place cane and affected lower extremity on step; when descending, reverse procedure
6. Walk on client's affected side
7. Observe for incorrect use of cane
  - a. Leaning the body over cane
  - b. Shortening the stride on unaffected side

- c. Inability to develop the usual walking pattern
- d. Persistence of an abnormal gait pattern after cane is no longer needed

### C Nursing care: crutch walking

1. Teach exercises to strengthen triceps, finger flexors, and wrist and elbow extensors
2. Ensure correct fit of crutches
  - a. Measure distance from anterior fold of axilla to 15 cm (6 inches) out from heel
  - b. Axillary bars must be 5 cm (2 inches) below axillae and should be padded
  - c. Hand bars should allow almost complete extension of arm, with elbows flexed about 30 degrees when placing weight on hands
3. Ensure that rubber crutch tips are in good condition
4. Assist in use of correct technique, depending on ability to bear weight and to take steps with either one or both lower extremities
  - a. Four-point alternate crutch gait
    - (1) Right crutch, left foot, left crutch, right foot; always three points of support on floor
    - (2) Equal but partial weight-bearing on each limb; slow, stable gait
    - (3) Must be able to bear weight on and manipulate both extremities, and move one foot ahead of the other
  - b. Two-point alternate crutch gait
    - (1) Right crutch and left foot simultaneously, then left crutch and right foot simultaneously; always two points of support on floor
    - (2) More rapid version of four-point gait and requires more balance and strength
  - c. Three-point gait
    - (1) Advance both crutches and weaker lower extremity simultaneously, then stronger lower extremity
    - (2) Fairly rapid gait, but requires more balance and strength in arms and unaffected lower extremity
    - (3) Used when one leg can support total body weight and the other cannot take full weight-bearing
  - d. Swing crutch gaits: used when client has bilateral paralysis of legs and hips
    - (1) Swing-to gait: place both crutches forward, lift and swing body up to crutches, then place crutches in front of body and continue; always two points of support on floor; needs power in upper arms
    - (2) Swing-through gait: place both crutches forward, lift and swing body through crutches, then place crutches in front of body and continue; difficult gait that necessitates rolling pelvis forward and arching back to get center of gravity in front of hips; needs power in trunk and upper extremities, excellent balance, and self-confidence
  - e. Ascending stairs: transfer weight to crutches and move unaffected leg up to next step; transfer weight to unaffected leg; bring crutches and affected leg up to the step
  - f. Descending stairs: transfer weight to unaffected leg; move crutches and affected

leg down a step; transfer weight to crutches; bring unaffected leg down to the step

5. Observe for incorrect use of crutches

- a. Hiking hips with abduction gait (common with amputees)
- b. Lifting crutches while still bearing down on them
- c. Walking on ball of foot with foot turned outward and flexion at hip or knee level
- d. Hunching shoulders (crutches usually too long) or stooping shoulders (crutches usually too short)
- e. Looking downward while ambulating
- f. Bearing weight under arms should be avoided to prevent injury to nerves in the brachial plexus; damage to these nerves can cause paralysis and is known as *crutch palsy*

D Nursing care: use of a walker

1. Assist in selecting a walker

- a. Device should be used when unable to ambulate with a cane; partial weight-bearing required
- b. Measurements are same as those for a cane
- c. Requires strong elbow extensors and shoulder depressors and partial strength in hands and wrist muscles to lift a standard walker; two- and four-wheeled walkers available
- d. Cannot be used on steps

2. Assist in ambulating with a walker

- a. Lift off floor and place forward a short distance, then advance between walker
- b. Two-wheeled walkers: raise back legs off floor, roll walker forward, then advance to it
- c. Four-wheeled walkers: push forward on floor and then walk to it

3. Observe for incorrect use of a walker

- a. Keeping arms rigid and swinging through to counterbalance position of lower extremities
- b. Tending to lean forward with abnormal flexion at hips
- c. Tending to step forward with unaffected leg and shuffle affected leg up to walker

## **Mobility: Wheelchairs/Mobility Scooters**

### A Definition

1. Special chairs with wheels that support and move client; propelled by another, the client, or a motor
2. Provide mobility for those who cannot ambulate or those who can ambulate but whose ambulation is unsteady, unsafe, or too strenuous
3. Decrease oxygen demands and cardiac workload
4. Promote independence and stimulate activities

### B Nursing care

1. Teach that prolonged sitting can cause flexion contractures of hips and knees and ischial pressure ulcers; encourage to use padded cushions and change body position and/or perform exercises (e.g., push-ups) every hour to relieve pressure

2. Ensure operating condition (e.g., wheel brakes, arm locks, seat belts, swing foot rests); inform about accessories (e.g., removable arms, lap boards, extra-long leg panels, battery or motor propulsion)
3. Assist with transfer; keep in close proximity to bed or chair when transferring; position on unaffected side if client has unilateral weakness (except clients on total hip precautions who often transfer toward affected side to avoid adduction)

## ***Instillation of Eye Medications***

### **A Definition**

1. Introduction of prescribed medication in eye
2. Promotes therapeutic effect of medication at local site

### **B Nursing care**

1. Position with head slightly backward
2. Pull lower eyelid down and instill solution in center of conjunctival sac; ointment applied from inner canthus outward
3. Instruct to close eyes gently and not to rub eyes
4. Apply pressure to nasolacrimal duct if liquid is instilled to reduce systemic effects

## ***Irrigations of the Ear***

### **A Definition**

1. Introduction of fluid into external auditory canal
2. Usually done for cleansing but can be used to apply antiseptic solutions

### **B Nursing care**

1. Verify tympanic membrane is intact
2. Assist to a sitting position with head tilted to affected side for irrigation to facilitate drainage; for instillations, assist to lie on unaffected side
3. Straighten canal to promote flow of fluid: gently pull on external ear up and back for an adult and pull down and back for a child younger than 3 years of age
4. Direct solution into ear canal without exerting excessive force; collect returns in a basin
5. Dry outer ear
6. Document procedure, type of drainage, client response

# Major Disorders of the Neuromusculoskeletal System

## Traumatic Brain Injuries

### **Data Base**

#### A Etiology and pathophysiology

1. Motor vehicle collisions are most common cause; other causes are assaults, falls, and sport-related accidents
2. Sudden force to head
  - a. Acceleration injury: immobile head struck by moving object
  - b. Deceleration injury: head hits stationary object
  - c. Deformation injury: force disrupts integrity of skull
3. Fractures
  - a. Linear: simple break of bone
  - b. Depressed: break that results in fragments of bone penetrating brain tissue
  - c. Basilar: occurs over base of frontal and temporal lobes; ecchymosis is common over areas involved
4. Hemorrhages (secondary brain injury)
  - a. Epidural: hematoma forms between dura and skull; may result from laceration of middle meningeal artery
  - b. Subdural: hematoma forms between dura and arachnoid layers; generally follows venous damage
  - c. Intracerebral hematoma: collection of blood within brain parenchyma
5. Concussion: temporary disruption of synaptic activity; brief loss of consciousness (less than 5 minutes)
6. Contusions: bruising of brain tissue, with slight bleeding of small cerebral vessels into surrounding tissues at site of impact (coup) or opposite to site (contrecoup) as a result of rebound reaction
  - a. Cerebral contusions manifest depending on areas involved
  - b. Brainstem contusions result in unresponsiveness
7. Complications include cerebral edema, increased intracranial pressure, brain abscess, meningitis, diabetes insipidus, hydrocephalus (from blocked absorption of CSF), death

#### B Clinical findings

1. Subjective: lethargy; indifference to surroundings; altered sensory function (e.g., visual or auditory)
2. Objective
  - a. Signs of increased intracranial pressure (see [Brain Tumors](#))
  - b. Lack of orientation to time and place
  - c. Positive Babinski reflex
  - d. Seepage of CSF from nose or ears; usually indicative of basilar skull fracture

#### C Therapeutic interventions

1. Control of seizures with anticonvulsants
2. Intubation and mechanical ventilation if comatose to ensure airway and oxygenation;  $\text{PaCO}_2$  maintained in low normal range to avoid vasodilation
3. Monitoring of intracranial pressure with external catheter such as ventricular catheter or subarachnoid screw
4. Reduction of cerebral edema with positioning and hypertonic saline
5. Maintenance of adequate fluid and electrolyte balance
6. Surgical intervention in cases of depressed skull fractures or hematomas
7. Antibiotics to prevent infection if indicated (e.g., basilar skull fracture)

## ***Nursing Care of Clients with Traumatic Brain Injuries***

### **Assessment/Analysis**

1. Airway and breathing pattern
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
3. Signs and symptoms of increased intracranial pressure (see [Brain Tumors](#))
4. Circumstances of injury
5. Presence of glucose in clear drainage from nose or ears, which indicates CSF

### **Planning/Implementation**

1. Institute neurologic assessments including Glasgow Coma Scale every 15 minutes for several hours, progressing to every hour and then every 4 hours when condition stabilizes
2. Maintain airway by suctioning as necessary because coughing increases intracranial pressure; use an airway or endotracheal tube
3. Keep head elevated 30 to 45 degrees to reduce venous pressure within cranial cavity; maintain straight alignment of head and neck
4. Institute seizure precautions; protect from injury; administer prescribed anticonvulsants
5. Monitor for fluid or electrolyte imbalances; diabetes insipidus or syndrome of inappropriate antidiuretic hormone may occur
6. If eyes remain open, protect corneas with artificial tears, or ointment as prescribed
7. Support nutritional needs; administer tube feedings or assist with small, frequent meals
8. Reposition to prevent pressure ulcers
9. Perform range-of-motion exercises and use ordered splints to prevent contractures
10. Provide auditory and tactile stimulation
11. Assist to avoid activities that increase intracranial pressure (e.g., Valsalva maneuver, lifting, sneezing, neck flexion, straining at stool, isometric exercises); administer prescribed stool softeners
12. Recognize that confusion after return of consciousness may be a defense against

stress or indication of a neurologic deficit

13. Maintain hypothermia as ordered to reduce temperature and metabolic demands
14. Encourage client and family to participate in planning and care
15. Provide opportunity for expression of feelings
16. Participate in preventive education (e.g., use of seat belts, helmets)

## Evaluation/Outcomes

1. Maintains a patent airway
2. Improves level of consciousness
3. Remains free from complications of immobility
4. Participates in decisions about care

## Brain Tumors

### Data Base

#### A Etiology and pathophysiology

1. Either benign or malignant; intervention required because of rise in intracranial pressure, since skull cannot accommodate the increasing size of the tumor
2. Classifications
  - a. Benign, malignant, or metastatic (from lung, breast, colon, pancreas, kidney)
  - b. Location: supratentorial—within cerebral hemispheres; infratentorial—within brainstem structures and cerebellum
  - c. Cellular or anatomical origin
    - (1) Gliomas: most common; originate in neural tissue; usually malignant (e.g., astrocytoma, glioblastoma, oligodendroglioma)
    - (2) Meningioma: arises from meninges that cover the brain; usually benign
    - (3) Acoustic neuroma: tumor of eighth cranial nerve

#### B Clinical findings

1. Subjective: headache that increases when supine or stooping; lethargy; nausea
2. Objective: signs of increased intracranial pressure; abnormal CT scan, MRI, electroencephalogram (EEG); vomiting; papilledema
3. Symptoms vary depending on location
  - a. Frontal lobe: personality changes, focal seizures, blurred vision, hemiparesis, altered thought processes
  - b. Temporal lobe: seizures, headache, papilledema, receptive aphasia, tinnitus
  - c. Parietal lobe: visual loss, motor and sensory focal seizures
  - d. Occipital region: focal seizures, visual hallucinations, homonymous hemianopsia
  - e. Cerebellar region: loss of coordination, tremors, nystagmus

#### C Therapeutic interventions

1. Radiation therapy and/or chemotherapy
2. Brachytherapy: surgically implanted radioactive source
3. Surgery for partial or complete removal of lesion

- a. Craniotomy with removal of lesion and invaded tissue
  - b. Stereotactic radiosurgery: employs computer-directed radiation to eradicate tissue
4. Steroids, anticonvulsives, osmotic diuretics, and antiemetics to control signs and symptoms

## ***Nursing Care of Clients with Brain Tumors***

### **Assessment/Analysis**

1. History to identify behavioral changes, coping skills, and neurologic deficits
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
3. Signs of increased intracranial pressure
  - a. Decreased level of consciousness
  - b. Unilateral nonreactive and/or dilated pupil progressing to bilateral
  - c. Rapid rise in temperature; decreased pulse rate; changes in respiratory pattern
  - d. Increased systolic pressure; widening pulse pressure
  - e. Restlessness
  - f. Headache most common in morning after body has been horizontal for several hours; intensified by coughing, sneezing, or straining, which increase intracranial pressure
  - g. Weakness or paralysis
  - h. Visual and other sensory disturbances; papilledema
  - i. Vomiting
  - j. Seizures
4. Nutritional status

### **Planning/Implementation**

1. Monitor neurologic status
2. Provide emotional support for client and family; refer to support groups and hospice if indicated
3. Administer prescribed corticosteroids and antiemetics
4. Offer small, frequent feedings, supplements, and oral hygiene
5. Provide care for client requiring brain surgery
  - a. Obtain consent for surgery and removal of hair
  - b. After surgery keep head elevated 30 degrees
  - c. Support respiratory function by encouraging deep breathing, appropriate positioning, and suctioning to maintain airway
  - d. Use strict aseptic technique with intracranial pressure monitoring
  - e. Observe dressings for CSF leakage or hemorrhage
  - f. Monitor I&O
  - g. Use hypothermia as ordered if febrile; fever increases metabolic needs of brain
6. Teach to avoid activities that increase intracranial pressure (e.g., Valsalva maneuver,

lifting, straining at stool, isometric exercises)

7. Help focus on abilities rather than disabilities

8. Emphasize need for continued health care

## Evaluation/Outcomes

1. Maintains adequate respiratory function

2. Performs activities of daily living (ADLs) with assistance

3. Establishes effective communication

## Brain Attack/Cerebral Vascular Accident (CVA)

### Data Base

A Etiology and pathophysiology

1. Destruction (infarction) of brain cells caused by effects of a reduction in oxygen supply

a. Ischemic attack results when brain tissues are blocked from oxygen supply by thrombus or embolus; 83% of attacks are this type

b. Hemorrhagic attack results from bleeding into brain tissue or subarachnoid space

2. Effects depend on area of brain involved and extent of damage; may be masked or delayed because of compensatory collateral circulation through circle of Willis

3. Risk factors include hypertension, hyperlipidemia, obesity, smoking, cerebral arteriosclerosis, cerebral aneurysm, atrial fibrillation, diabetes mellitus, advanced age, African-American ancestry

4. Temporary cerebral dysfunction (transient ischemic attacks [TIAs]) may also occur without causing permanent damage; these last a few minutes to 24 hours; predictive of impending brain attack

B Clinical findings

1. Subjective: syncope; headache; changes in level of consciousness; unilateral paresthesias; mood swings

2. Objective

a. Hemiparesis (weakness on one side of body) or hemiplegia (paralysis on one side of body) on side opposite the lesion in the brain; initially flaccid, then spastic

b. Aphasia: brain unable to fulfill its communicative functions because of damage to input, integrative, or output centers

(1) Expressive (motor or Broca) aphasia: difficulty making thoughts known to others; speaking and writing are most affected

(2) Receptive (sensory or Wernicke) aphasia: difficulty understanding what others are trying to communicate; interpretation of speech and reading is most affected

(3) Global aphasia: affects both expression and reception

(4) Dysarthria: difficulty speaking because of paralysis of muscles needed for articulation

c. Dysphagia: difficulty swallowing

d. Visual changes

- (1) Homonymous hemianopsia: loss of vision in half of same visual field in both eyes
- (2) Agnosia: disturbance in ability to recognize objects and attach meaning to them
- (3) Ptosis and paralysis of ocular muscles (Horner syndrome)

e. Alterations in reflexes

f. Altered bladder and bowel function (e.g., incontinence, retention)

g. CSF is bloody with cerebral or subarachnoid hemorrhage

h. Abnormal EEG, CT scan, MRI

i. Cerebral angiography may reveal vascular abnormalities (e.g., aneurysms, narrowing, or occlusions)

j. Signs of increased intracranial pressure (see [Brain Tumors](#))

C Therapeutic interventions

1. Modification of risk factors (e.g., weight loss, antiplatelet therapy for atrial fibrillation, low-fat diet and statins for hyperlipidemia, smoking cessation)
2. Complete bed rest with sedation as needed
3. Maintenance of oxygenation with oxygen therapy or mechanical ventilation
4. If ischemic type, thrombolytic therapy with recombinant tissue plasminogen activator (t-PA) within 3 hours of onset
5. Maintenance of nutrition by parenteral route or nasogastric feedings if unable to swallow
6. Anticoagulant/antiplatelet therapy if caused by a thrombus or embolus
7. Antihypertensives and anticonvulsants if indicated
8. Antiinflammatory or osmotic diuretics to reduce cerebral edema and intracranial pressure
9. Surgical intervention
  - a. Carotid endarterectomy or stent placement (may be done prophylactically) to improve cerebral blood flow when carotid arteries are narrowed by arteriosclerotic plaques
  - b. Performed to relieve pressure and control bleeding if hemorrhage is present

## ***Nursing Care of Clients with Brain Attacks***

### **Assessment/Analysis**

1. Adequacy of airway and respiratory function
2. FAST assessment recommended by The National Stroke Association
  - a. Face: ask client to smile; does one side of face droop?
  - b. Arms: ask client to raise both arms; does one arm drift downward?
  - c. Speech: ask client to repeat a simple sentence; does the speech sound slurred or strange?
  - d. Time: if any of the signs are observed, call emergency services (e.g., 911), rapid response team

3. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
4. Signs of increased intracranial pressure (see [Brain Tumors](#))

## Planning/Implementation

1. Perform neurologic assessments; identify signs of increased intracranial pressure
2. Monitor vital signs; avoid using affected extremity for blood pressure measurement because reading may be falsely lowered
3. Maintain patency of airway by positioning, suctioning, and inserting an artificial airway
4. Place in low semi-Fowler position to decrease intracranial pressure; turn to side to drain oral secretions and prevent aspiration; provide oxygen as necessary
5. Encourage deep breathing; use mechanical ventilation if ordered
6. Involve all health care team members when planning care
7. Encourage and assist client and family to set realistic goals
8. Accept and explore feelings of fear, anger, and depression; accept mood swings
9. Provide frequent oral hygiene; use artificial tears if blink reflex is absent
10. Institute seizure precautions
11. Apply elastic or pneumatic stockings
12. Prevent pressure ulcers ([Chapter 10, Nursing Care of Clients with Integumentary System Disorders, Pressure Ulcers](#))
13. Prevent muscle atrophy and contractures
  - a. Perform passive range-of-motion exercises initially; active range-of-motion and other exercises may be instituted later
  - b. Maintain functional alignment: use devices to prevent footdrop, flexion of fingers, external rotation of hips, adduction of shoulders and arms; turn every 1 to 2 hours; raise side rails for safety and to facilitate self-turning
  - c. Collaborate with physical therapist about rehabilitation plan
14. Administer tube feedings if ordered when swallowing and gag reflexes are depressed or absent
15. Provide food in a suitable form based on degree of dysphagia (e.g., mechanical soft, pureed, thickening products); encourage intake of nutrient-dense foods; when capable of chewing, introduce dietary fiber to promote bowel function
16. Assist with feeding (e.g., use a padded spoon handle; feed on unaffected side of mouth; feed in as close to a sitting position as possible); allow sufficient time for adequate chewing and swallowing
17. Encourage client with dysarthria or aphasia to communicate
  - a. Be aware of own reactions to the speech difficulty
  - b. Evaluate extent of ability to understand and express self
  - c. Reinforce exercises learned in speech therapy; provide positive feedback
  - d. Convey that problem is with communication, not intelligence; try to reduce anxiety related to communication
  - e. Be patient when communicating with client; avoid pushing client to point of

frustration

- f. Minimize distractions that interfere with message reception and interpretation
- g. Face client directly when communicating; speak slowly, clearly, and in short sentences; do not raise voice; connect words with objects
- h. Use alternative means of communication; develop a system of cues
- i. Involve client in social interactions
- j. Be alert for clues and gestures when speech is garbled

18. Make a definite transition between tasks to prevent or reduce confusion

19. Attempt to prevent fecal impaction and/or urinary tract problems

- a. Assess for signs of urinary retention (e.g., suprapubic distention, frequently urinating small amounts)
- b. Maintain adequate fluid intake
- c. Provide a diet with roughage of sufficient quantity and consistency to promote bowel elimination
- d. Stimulate elimination by exercise
- e. Teach to avoid straining at stool because it can raise intracranial pressure; administer stool softeners as ordered because a full rectum puts pressure on the bladder, which promotes urinary incontinence
- f. Use physical and psychologic techniques to stimulate elimination
- g. Avoid preoccupation with elimination; avoid encouragement of incontinence
- h. Help develop regular bowel and bladder patterns
- i. Be respectful; provide for privacy and individuality of routine

20. Create environment that keeps sensory monotony to a minimum; orient to time and place; increase social contacts; provide visual stimuli; place objects and self within client's visual field

21. Promote self-esteem; encourage wearing own clothes, self-care activities, decision making

22. Instruct to report further neurologic deficits immediately so treatment can be initiated to prevent a brain attack

## Evaluation/Outcomes

- 1. Maintains respiratory function
- 2. Remains alert and oriented
- 3. Communicates effectively
- 4. Remains free of complications of immobility
- 5. Family and client participate in decisions and care

## Epilepsy (Seizure Disorders)

### Data Base

A Etiology and pathophysiology

- 1. Abnormal discharge of electric impulses by nerve cells in brain from idiopathic or

secondary causes, resulting in loss of consciousness; seizures; motor, sensory, behavioral changes

2. Onset of idiopathic epilepsy generally before age 30; seizures can be associated with brain tumor, brain attack, Alzheimer disease, hypoglycemia, head trauma, fluid shifts in the brain

3. Types of seizures

a. Partial seizures (seizures beginning locally)

(1) Simple: focal motor or sensory effect; no loss of consciousness

(2) Complex: cognitive, psychosensory, psychomotor, or affective effect; brief loss of consciousness

b. Generalized seizures (bilaterally symmetric and without local onset)

(1) Absence (petit mal): brief transient loss of consciousness with or without minor motor movements of eyes, head, or extremities; most common in childhood and adolescence

(2) Myoclonic: brief, transient rigidity or jerking of extremities, singly or in groups

(3) Tonic-clonic (grand mal): aura, loss of consciousness, rigidity followed by tonic-clonic movements, interruption of respirations, loss of bladder and bowel control; may last 2 to 5 minutes

(4) Atonic: loss of muscle control; loss of consciousness may be brief

c. Status epilepticus: prolonged repetitive seizures without recovery between attacks; may result in complete exhaustion, cerebral injury, or death

B Clinical findings (tonic-clonic seizures)

1. Subjective: often preceded by an aura or warning sensation such as seeing spots or feeling dizzy; lethargy following return to consciousness (postictal phase)

2. Objective

a. Shrill cry as seizure begins and air is forcefully exhaled

b. Loss of consciousness during seizure

c. Tonic-clonic movement of muscles

d. Incontinence

e. Abnormal EEG, MRI

C Therapeutic interventions

1. Anticonvulsant therapy usually continued throughout life (see [Related Pharmacology, Anticonvulsants \[Antiseizure, Antiepileptic Medications\]](#))

2. Diazepam (Valium) or lorazepam (Ativan) given IV to treat status epilepticus (see [Chapter 16, The Practice of Mental Health/Psychiatric Nursing, Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications](#))

3. Sedatives used to reduce emotional stress

4. Neurosurgery is sometimes indicated if source of seizures is localized; vagal nerve stimulation, which involves implantation of an electrical impulse generator, is a palliative treatment if therapy has been unsuccessful

## ***Nursing Care of Clients with Epilepsy***

## Assessment/Analysis

1. History of type, frequency, and duration of seizures; precipitating factors
2. Sensations associated with the seizure that may constitute an aura

## Planning/Implementation

1. Protect from injury during and after a seizure; nothing should be forced into the mouth because it may cause tongue to occlude the airway; attempts to restrain should be avoided because this may cause injury from muscle contractions; position on side if possible to facilitate drainage of oral secretions
2. Teach how to protect self if an aura occurs indicating an imminent seizure
3. Encourage wearing a medical alert tag
4. Help plan a schedule that provides adequate rest and reduction of stress
5. Teach client and family to determine and report the presence of an aura, the initial point of seizure, type of seizure, level of consciousness, progression of seizure, incontinence, and postictal condition
6. Encourage expression of feelings about illness and necessary changes in lifestyle
7. Assist client and family to accept the diagnosis and develop understanding of the disease
8. Refer for job counseling as necessary
9. Encourage client and family to attend local epilepsy association meetings
10. Refer to state laws regarding driving
11. Teach about anticonvulsants and need for continued medical supervision (see [Related Pharmacology, Anticonvulsants \[Antiseizure, Antiepileptic Medications\]](#))

## Evaluation/Outcomes

1. Remains free from injury
2. Adheres to medical regimen

## Bell Palsy (Facial Paralysis)

### Data Base

#### A Etiology and pathophysiology

1. Paralysis occurring on one side of face resulting from an inflamed seventh cranial (facial) nerve; lasts about 2 to 8 weeks but may last longer in older adults
2. Cause unknown; possibly viral, ischemic, or autoimmune link
3. Most common between ages 20 and 50 years

#### B Clinical findings

1. Subjective: facial pain; altered taste; impaired ability to chew and swallow
2. Objective: distortion of face; drooping of mouth on affected side; difficulty with articulation; diminished blink reflex; inability to close eye; increased or decreased lacrimation

#### C Therapeutic interventions

1. Diagnostic evaluation to rule out (eliminate) brain attack as the cause
2. Corticosteroids (e.g., PredniSONE) antiviral (e.g., acyclovir [Zovirax]), and/or anticonvulsant (e.g., gabapentin [Neurontin]) therapy
3. Heat, massage, and electric stimulation to maintain circulation and muscle tone
4. Prevention of corneal irritation with eye drops and protective eye shield

## ***Nursing Care of Clients with Bell Palsy***

### **Assessment/Analysis**

1. Presence or absence of blink reflex and ability to close eye
2. Facial pain; extent of facial paralysis and altered sensation
3. Nutritional intake; ability to chew and swallow

### **Planning/Implementation**

1. Teach prevention of corneal irritation (e.g., using artificial tears, manually closing eye, applying an eye shield, wearing wraparound sunglasses)
2. Teach importance of keeping face warm
3. Teach gentle massage of face; simple exercises such as blowing through pursed lips when acute phase is over
4. Encourage expression of feelings
5. Teach importance of small, frequent feedings; encourage favoring unaffected side while eating

### **Evaluation/Outcomes**

1. Maintains corneal integrity
2. Expresses a positive body image
3. States pain is reduced

## **Trigeminal Neuralgia (Tic Douloureux)**

### ***Data Base***

#### **A Etiology and pathophysiology**

1. Disorder of fifth cranial (trigeminal) nerve characterized by intense knifelike pain along branches of the nerve
2. May result from abnormalities of ganglion, tumors, vascular anomalies, or dental infection
3. Incidence higher in people with multiple sclerosis, particularly men

#### **B Clinical findings**

1. Subjective: unilateral burning or knifelike pain lasting 1 to 15 minutes, usually in lip, chin, or teeth; pain precipitated by brushing hair, eating, cold drafts; exhaustion from prolonged/chronic pain
2. Objective: sudden closure of an eye; twitching of mouth and cheek

## C Therapeutic interventions

1. Anticonvulsants such as carbamazepine (Tegretol) to relieve and prevent acute attacks
2. Skeletal muscle relaxants such as baclofen (Lioresal) may help control symptoms
3. Surgical intervention
  - a. Microscopic relocation of arterial loop that may cause vascular compression of trigeminal nerve; preserves facial sensation, but pain relief lasts about 2 years
  - b. Percutaneous radio frequency trigeminal gangliolysis: destroys nerve, providing permanent relief for most clients; alters facial sensation and corneal reflex
  - c. Percutaneous balloon microcompression provides microvascular decompression of trigeminal nerve

## ***Nursing Care of Clients with Trigeminal Neuralgia***

### **Assessment/Analysis**

1. Description of pain and factors that precipitate attacks
2. Effect on activities (e.g., eating, shaving, washing face, brushing teeth) because of fear of precipitating an attack

### **Planning/Implementation**

1. Teach factors to limit triggering an attack
  - a. Avoid foods that are too cold or too hot
  - b. Chew soft foods on unaffected side
  - c. Use cotton pads to gently wash face and for oral hygiene
  - d. Keep room free of drafts; avoid jarring
  - e. Instruct to use scarves and hats to protect face from drafts and the cold
2. Teach clients who have sensory loss as a result of treatment
  - a. Inspect eye for irritation and foreign bodies
  - b. Perform warm normal saline irrigation of affected eye two or three times a day to help prevent corneal infection
  - c. Have dental checkups every 6 months because caries will not produce pain
3. Teach about anticonvulsants and the need for continued medical supervision (see [Related Pharmacology](#), [Anticonvulsants \[Antiseizure, Antiepileptic Medications\]](#))

### **Evaluation/Outcomes**

1. Reports decreased severity of pain and number of attacks
2. Consumes nutritionally balanced diet
3. Develops mechanisms to cope with fear of attacks

## **Parkinson Disease (Paralysis Agitans)**

### ***Data Base***

A Etiology and pathophysiology

1. Progressive disorder with destruction of nerve cells in the basal ganglia and substantia nigra of the brain, which results in dopamine deficiency and subsequent generalized degeneration of muscular function
  2. Risk factors: advanced age; family history
- B Clinical findings ([Figure 11-4](#): Parkinson disease: clinical findings)

**FIGURE 11-4** Parkinson disease: clinical findings. (Modified from Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.)

1. Subjective: fatigue; mild, diffuse, muscular pain; stiffness and rigidity, particularly of large joints; depression
2. Objective
  - a. Diminished voluntary motion resulting in increased difficulty in performing usual activities: dressing, eating, swallowing, walking (e.g., reduced arm swing, bent posture, difficulty rising from a sitting position, shuffling propulsive gait); cogwheel motion when limbs are passively moved; small handwriting (micrographia)
    - (1) Bradykinesia: slowness of voluntary movement
    - (2) Hypokinesia: decreased movement
    - (3) Akinesia: inability to move
  - b. Resting tremor (nonintention tremor) commonly accompanied by “pill-rolling” movements of thumb against fingers; usually reduced by purposeful movements
  - c. Masklike facial expression, unblinking eyes
  - d. Dysphonia: low-pitched, slow, poorly modulated, poorly articulated speech
  - e. Drooling; difficulty in swallowing saliva
  - f. Various autonomic signs (e.g., lacrimation, constipation, incontinence, decreased sexual capacity, excessive perspiration)

- g. Dementia and confusion in approximately 60% of individuals, especially older adults

#### C Therapeutic interventions

1. Medical regimen is palliative rather than curative
2. Pharmacologic intervention (see [Related Pharmacology, Antiparkinson Agents](#))
3. Physiotherapy to reduce rigidity of muscles and prevent contractures
4. Role of surgical intervention is limited
  - a. Deep brain stimulation by implanted electrode attached to pulse generator (similar to a pacemaker)
  - b. Destruction of thalamus or globus pallidus for intractable tremor and rigidity using stereotactic nerve stimulation
  - c. Neural transplant and gene transfer techniques are being studied

### ***Nursing Care of Clients with Parkinson Disease***

#### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Use of antiparkinson medications
3. Observations of tremors, posture, gait, facial expression
4. Nutritional status
5. Elimination status
6. Horizontal and vertical blood pressures to identify postural hypotension

#### **Planning/Implementation**

1. Provide a safe environment
2. Teach client or family to cut food into small bite-sized pieces or alter consistency to prevent choking; encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent possible drug-induced deficiencies
3. Suction secretions as needed to maintain an adequate airway; usually necessary in advanced stages
4. Encourage adequate intake of roughage and fluids to prevent constipation
5. Teach activities to limit postural deformities (e.g., use firm mattress without a pillow, periodically lie prone, keep head and neck as erect as possible, avoid leaning forward when walking)
6. Teach activities to maintain appropriate gait and maintain safety; use cane or walker as necessary
7. Teach and encourage daily physical therapy to limit rigidity and prevent contractures (e.g., warm baths, passive and active exercises)
8. Avoid rushing as stress intensifies symptoms
9. Encourage continuation of medications even though results may be minimal
10. Teach client and family about antiparkinson agents (see [Related Pharmacology](#),

## Antiparkinson Agents)

11. Assist in setting achievable goals to improve self-esteem

## Evaluation/Outcomes

1. Maintains patent airway
2. Participates in daily exercise program
3. Adheres to prescribed medical regimen
4. Remains free from injuries

## Multiple Sclerosis (Disseminated Sclerosis)

### Data Base

#### A Etiology and pathophysiology

1. Destruction of myelin in the CNS by sensitized T and B lymphocytes, causing randomly scattered plaques of sclerotic tissue on demyelinated axons; frequently affected areas include optic nerves, cerebrum, brainstem, cerebellum, and spinal cord
2. Considered a chronic, debilitating, progressive disease with periods of remission and exacerbation
3. Types
  - a. Relapsing-remitting (RR): acute episodes with almost a complete recovery between attacks
  - b. Primary progressive (PP): steady degenerative progression without exacerbation
  - c. Secondary progressive (SP): initially RR followed by steady deterioration later in disease process
  - d. Progressive-relapsing (PR); progressive but with periodic acute exacerbations
4. Cause unknown; viral, environmental, and immunologic causes are implicated
5. Onset in early adult life (20 to 40 years); higher incidence in females, Caucasians, those living in temperate climates, and those with trigeminal neuralgia
6. Fatigue, stress, and heat tend to increase symptoms

#### B Clinical findings

##### 1. Subjective

- a. Numbness; altered position sense
- b. Difficulty swallowing (dysphagia)
- c. Weakness; fatigue
- d. Blurred vision; diplopia
- e. Emotional lability (e.g., depression, apathy, euphoria)

##### 2. Objective

- a. Charcot triad: intention tremor; nystagmus; scanning (clipped) speech
- b. Ataxia; shuffling gait; increased deep tendon reflexes; spastic paralysis
- c. Impaired bowel and bladder function
- d. Impotence
- e. Cognitive loss in advanced stage

- f. Pallor of optic discs; blindness
- g. Increased immunoglobulin G (IgG) levels in the CSF
- h. MRI indicates demyelination and presence of multiple sclerosis plaques

#### C Therapeutic interventions

1. Generally palliative
2. Disease-modifying therapy
  - a. Interferon beta-1a (Avonex) given IM, (Rebif) given Sub-Q
  - b. Interferon beta-1b (Betaseron) given Sub-Q
  - c. Glatiramer acetate (Copaxone) given Sub-Q
  - d. Mitoxantrone (Novantrone) given IV every 3 months
3. Additional drugs: corticosteroids to shorten duration of relapses, baclofen (Lioresal) for spasticity, carbamazepine (Tegretol) for trigeminal neuralgia, ascorbic acid to acidify urine, immunosuppressive agents
4. Physical therapy and psychotherapy

### ***Nursing Care of Clients with Multiple Sclerosis***

#### **Assessment/Analysis**

1. History of onset and progression of motor and sensory loss
2. Factors that intensify symptoms
3. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))

#### **Planning/Implementation**

1. Explain disease process to both client and family
2. Spend time listening to both client and family; encourage ventilation of feelings
3. Explain to client and family that mood swings and emotional alterations are part of the disease
4. Refer client and family to local chapter of the National Multiple Sclerosis Society
5. Help client maintain self-esteem
6. Do not encourage false hopes during periods of remission
7. Encourage counseling and rehabilitation
8. Teach to take medications as prescribed; reinforce injection technique; explain Interferon beta-1a (Avonex) may cause flulike symptoms
9. Teach client to:
  - a. Plan frequent rest periods
  - b. Avoid hot baths, which can increase symptoms
  - c. Be active within limitations; use assistive devices for ADLs
  - d. Implement a bowel and bladder regimen; teach urinary self-catheterization if appropriate
  - e. Compensate for problems with gait: walk with feet farther apart to broaden base of support; use low-heeled shoes; use assistive devices when necessary (e.g., tripod

cane, walker, wheelchair)

- f. Compensate for loss of sensation: use a thermometer to test water temperature; avoid constricting stockings; use protective clothing in cold weather; change position frequently
- g. Compensate for difficulty in swallowing: take small bites; chew well; use a straw with liquids; eat foods of more solid consistency
- h. Eat a diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and compensate for nutrient interactions of corticosteroid medications; some health care providers advise avoidance of “night shade” foods (e.g., tomatoes, peppers, eggplant) and adherence to a low-fat diet

10. Provide skin care to prevent formation of pressure ulcers; turn frequently

11. Prevent dysfunctional contractures; provide range-of-motion exercises; splints

## Evaluation/Outcomes

- 1. Maintains a patent airway
- 2. Remains free from injury
- 3. Establishes exercise/activity and rest/sleep routine that avoids fatigue
- 4. Maintains bowel and bladder function
- 5. Remains free from urinary tract infection
- 6. Copes with changes in physical abilities and lifestyle changes

## Myasthenia Gravis

### Data Base

A Etiology and pathophysiology

- 1. Chronic, progressive, neuromuscular disorder with remissions and exacerbations; disturbance in transmission of impulses at myoneural junction, resulting in profound weakness
- 2. Dysfunction caused by reduced acetylcholine receptors (AChR) and altered postsynaptic membrane of muscle end plates
- 3. Autoimmune theory: antibodies to AChR cause accelerated destruction and blockage of AChR
- 4. Highest incidence in young adult women ages 20 to 40; peak incidence in men ages 60 to 70
- 5. Myasthenic crisis
  - a. Sudden, severe exacerbation of signs and symptoms of myasthenia gravis; precipitated by conditions such as disease exacerbation, infection, and inadequate amount of anticholinesterase drugs
  - b. Signs and symptoms: increased pulse, respirations, and blood pressure; respiratory distress with cyanosis; loss of cough and swallowing reflexes; increased respiratory secretions; diaphoresis; increased lacrimation; dysarthria; restlessness;

bowel and bladder incontinence

## 6. Cholinergic crisis

- a. Overmedication of anticholinesterase medication; sudden onset
- b. Signs and symptoms: drooping eyelids (ptosis); weakness; difficulty swallowing, chewing, speaking, and breathing; abdominal cramps and diarrhea; increased respiratory secretions; diaphoresis, increased lacrimation; fasciculations; blurred vision

## B Clinical findings

1. Subjective: extreme muscle weakness; becomes progressively worse with use, but improves with rest; dyspnea; transient respiratory insufficiency; dysphagia (difficulty chewing and swallowing); dysarthria (difficulty speaking); diplopia
2. Objective
  - a. Physical: ptosis; strabismus; weak voice (dysphonia); myasthenic smile (snarling, nasal smile); ineffective cough; enlarged thymus
  - b. Diagnostic measures: spontaneous relief of symptoms with IV administration of edrophonium (Enlon, Tensilon); edrophonium also used to distinguish myasthenic crisis from cholinergic crisis (toxic effects of excessive neostigmine)

## C Therapeutic interventions

1. Medications that block cholinesterase at myoneural junction (see [Related Pharmacology, Cholinesterase Inhibitors](#))
2. Radiation therapy or surgical removal of thymus gland may cause partial remission by producing antigen-specific immunosuppression
3. Corticosteroids to suppress antibody production
4. Intubation with mechanical ventilation as necessary in myasthenic crisis
5. Plasmapheresis and immunosuppressives to reduce circulating antibody titer
6. Tube feedings if experiencing dysphagia

## ***Nursing Care of Clients with Myasthenia Gravis***

### **Assessment/Analysis**

1. History of onset and progression of motor and sensory loss
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
3. Respiratory status: vital signs, depth of respirations, breath sounds, oxygen saturation, arterial blood gases

### **Planning/Implementation**

1. Administer medications on strict time schedule to prevent onset of symptoms; medication may need to be administered during night
2. Monitor for signs and symptoms of myasthenic and cholinergic crises; administer short-acting cholinesterase inhibitor per protocol to distinguish between the two; signs and symptoms will temporarily improve with myasthenic crisis and intensify with

cholinergic crisis

3. Keep head of bed elevated
4. Plan activity to avoid fatigue based on tolerance; collaborate with client to develop individualized energy-saving strategies
5. Teach client and family to wash hands frequently and to avoid people with upper respiratory tract infections because pneumonia may develop as a result of respiratory impairment
6. Encourage carrying medical alert information
7. Avoid administering morphine to clients receiving cholinesterase inhibitors; these drugs potentiate effects of morphine and may cause respiratory depression
8. Provide emotional support
9. Schedule meals to coincide with peak drug action; administer tube feedings as ordered
10. Tape eyelids closed for short periods and administer artificial tears to keep cornea moist if client has difficulty closing eyes
11. Encourage client and family to participate in planning care
12. Teach client and family signs and symptoms of myasthenic crisis and cholinergic crisis
13. Maintain a patent airway; suction client's secretions as necessary; maintain mechanical ventilation as ordered
14. Anticipate all needs during exacerbations because client is too weak to turn, drink, or even request assistance
15. Refer client and family to Myasthenia Gravis Foundation and local self-help groups

## Evaluation/Outcomes

1. Maintains a balance between activity and rest
2. Maintains effective respiratory function
3. Identifies signs and symptoms of crises

## Guillain-Barré Syndrome (Polyradiculoneuritis)

### Data Base

A Etiology and pathophysiology

1. Autoimmune response that destroys peripheral nerve myelin
2. May follow respiratory or gastrointestinal viral infection, vaccination, pregnancy, or surgery
3. Recovery may take 2 years after initial and plateau periods; although most fully recover, some experience residual deficits or die of complications

B Clinical findings

1. Subjective: ascending weakness that begins in lower extremities; paresthesia; dysphagia; diplopia
2. Objective
  - a. Areflexia and paralysis beginning in lower extremities and progressing upward;

maximal deficit usually by 4 weeks

b. Respiratory paralysis

c. Autonomic neuropathy (e.g., hypertension, bradycardia, tachycardia, diaphoresis)

d. Abnormal CSF and electrophysiologic studies

#### C Therapeutic interventions

1. IV therapy with IgG

2. Plasmapheresis to facilitate removal of antibodies

3. Support of vital functions

## ***Nursing Care of Clients with Guillain-Barré Syndrome***

### **Assessment/Analysis**

1. Respiratory function including airway, respiratory rate, breath sounds, oxygen saturation, and arterial blood gases
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#)); does not affect level of consciousness or cognition
3. History of recent illness, particularly viral infections
4. History of onset and progression of symptoms

### **Planning/Implementation**

1. Monitor vital signs, breath sounds, and oxygen saturation
2. Maintain airway; provide pulmonary physiotherapy; suction as necessary; be prepared for intubation and mechanical ventilation
3. Monitor gag and swallow reflexes; maintain gastrostomy tube feedings as necessary; monitor bowel sounds (paralytic ileus may occur); monitor urinary output
4. Provide emotional support for client and family because of severity of physiological manifestations and lengthy convalescent period
5. Prevent complications of immobility (e.g., skin care; range-of-motion exercises; position changes; coughing and deep breathing; antiembolism stockings)
6. Refer client and family to Guillain-Barré Foundation for additional information and community resources

### **Evaluation/Outcomes**

1. Maintains effective respiratory function
2. Remains free from complications of immobility
3. Discusses feelings with family and other health care team members

## **Amyotrophic Lateral Sclerosis (ALS)**

### **Data Base**

A Etiology and pathophysiology

1. Progressive, degenerative process involving motor neurons of spinal cord, medulla,

and cortex; both upper and lower motor neurons are affected

2. Cause unknown; autoimmune diseases and genetic causes are implicated
3. Occurs more frequently in men than women in fifth and sixth decades
4. Death from respiratory complications frequently occurs within 3 to 5 years
5. Often called Lou Gehrig's disease

#### B Clinical findings

1. Subjective: muscular weakness; malaise; fatigue
2. Objective
  - a. Fasciculations (irregular spasmodic twitching of small muscle groups); spasticity; atrophy
  - b. Overactive deep tendon reflexes
  - c. Difficulty in breathing, chewing, swallowing, speaking
  - d. Outbursts of laughter or crying
  - e. Abnormal electromyography

#### C Therapeutic interventions

1. Physiotherapy and skeletal muscle relaxants to relieve spasticity
2. Respiratory function support with mechanical ventilation
3. Riluzole (Rilutek) to inhibit glutamate accumulation, possibly preventing injury or death of neurons

## ***Nursing Care of Clients with Amyotrophic Lateral Sclerosis***

### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
3. Respiratory status (e.g., vital signs, respiratory depth, oxygen saturation)

### **Planning/Implementation**

1. Encourage to remain active as long as possible, employing supportive devices
2. Encourage range-of-motion exercises
3. Monitor swallowing ability; place in semi- or high-Fowler position when eating; adjust consistency of food to prevent aspiration; provide enteral feedings via percutaneous endoscopic gastrostomy (PEG) tube as vital capacity drops
4. Provide alternate means of communication as speech declines
5. Encourage client and family to discuss feelings; explore advance directives while client is still able to speak
6. Maintain respiratory function (e.g., increased fluids, positioning, chest physiotherapy, coughing and deep-breathing exercises, suctioning, and mechanical ventilation)
7. Support natural defense mechanisms; encourage a diet consisting of nutrient-dense foods, especially those rich in immune-stimulating nutrients selenium and vitamins A, C, and E

8. Teach to avoid situations that may contribute to infection
9. Refer client and family to ALS Association

## Evaluation/Outcomes

1. Maintains effective respiratory function
2. Maintains nutritional status
3. Discusses feelings with family and other health care team members

## Arthritis

### Data Base

#### A Etiology and pathophysiology

1. Rheumatoid arthritis (RA)
  - a. Altered immune response; enzymes destroy collagen; synovial membrane proliferates, forming pannus, which destroys cartilage and bone; HLA-DR4 antibody usually present
  - b. Other effects: fever, weight loss, anemia, Raynaud phenomenon, arteritis, neuropathy, pericarditis, ankylosis, and Sjögren syndrome
  - c. Etiology unclear; apparent genetic predisposition; incidence higher in women
2. Osteoarthritis (OA, degenerative arthritis, degenerative joint disease)
  - a. Characterized by degeneration of articular cartilage
  - b. Noninflammatory joint disease with no systemic effects
  - c. Risk factors: age; obesity; injury; repetitive trauma from sports, occupation, or other activity; presence of *ank* gene
3. Gouty arthritis (GA)
  - a. Purine metabolism disorder, leading to increased uric acid in blood and deposition of uric acid crystals (tophi) in tissues, especially joints; followed by an inflammatory response
  - b. Incidence highest in males; familial tendency
  - c. Renal urate lithiasis (kidney stones) may result from precipitation of uric acid if there is a low urinary pH

#### B Clinical findings

1. Subjective
  - a. Joint pain
    - (1) OA: insidious onset of asymmetric pain in hips, knees, fingers, or spine that increases with weight-bearing activity and is relieved by rest
    - (2) RA: symmetrical pain in small joints of hands and feet; knees, shoulders, hips, elbows, and ankles affected as disease progresses; not relieved by rest
    - (3) GA: sudden onset of asymmetric joint pain usually in metatarsophalangeal joint of the great toe
  - b. Morning stiffness: lasts less than 1 hour with OA; more than 1 hour with RA
  - c. Anorexia, fatigue, and malaise (RA, GA)

## 2. Objective

- a. Decreased range of motion
- b. Signs of inflammation (e.g., swelling, heat, redness) in involved joints (RA, GA)
- c. Deformities ([Figure 11-5: Arthritic hand deformities](#))

**FIGURE 11-5** Arthritic hand deformities. **A**, Characteristics of osteoarthritis. **B**, Characteristics of rheumatoid arthritis. (**A**, from Mourad L: *Orthopedic disorders*, St. Louis, 1991, Mosby. **B**, from Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St. Louis, 2011, Mosby.)

- (1) Ulnar drift, Boutonnière deformity, swan neck deformity, rheumatoid nodules (RA), bony ankylosis
  - (2) Heberden and Bouchard nodes (bony hypertrophy) symmetrically occurring on fingers (OA)
  - (3) Tophi in outer ear, hands, feet, elbows, or knees (GA)
- d. Crepitus when joint is moved (OA)

e. Fever (RA, GA)

f. Laboratory findings

(1) RA: presence of rheumatoid factor (RF), elevated erythrocyte sedimentation rate (ESR), decreased RBC count, and positive C-reactive protein and antinuclear antibody (ANA) tests; joint fluid analysis demonstrates inflammation

(2) GA: elevated serum uric acid

## C Therapeutic interventions

### 1. Pharmacologic management

a. Acetaminophen (Tylenol) (OA)

b. Nonsteroidal antiinflammatory drugs (RA, OA, GA) (see [Related Pharmacology, Nonsteroidal Antiinflammatory Drugs \[NSAIDs\]](#))

c. Tumor necrosis factor inhibitors: etanercept (Enbrel), infliximab (Remicade), adalimumab (Humira)

d. Disease-modifying antirheumatic drugs (DMARDs) such as anakinra (Kineret), azathioprine (Imuran), cycloSPORINE (Sandimmune), hydroxychloroquine (Plaquenil), injectable gold compounds, leflunomide (Arava), methotrexate (Rheumatrex Dose Pack), sulfasalazine (Azulfidine) (RA)

e. Viscosupplementation with hyaluronic acid joint injections (OA)

f. Antigout agents (see [Related Pharmacology, Antigout Agents](#)) (GA)

g. Corticosteroids to reduce inflammation (RA and resistant GA)

h. While research has not supported the efficacy of glucosamine and chondroitin, some clients report reduced pain with these supplements (OA); glucosamine has a glucose base that interferes with antidiabetic medications

### 2. Weight loss if indicated

### 3. Physical therapy to preserve joint function; application of heat/cold

### 4. Splints and assistive devices

### 5. Surgical intervention (RA, OA); often done in a laminar air flow room

a. Synovectomy: removal of enlarged synovial membrane before bone and cartilage destruction occurs

b. Arthrodesis: fusion of a joint when joint surfaces are severely damaged; this results in no range of motion of affected joint

c. Arthroplasty (e.g., total hip, knee, and shoulder replacement): surgical repair of joint or replacement with a prosthetic device (see [Fracture of the Hip](#))

### 6. Extracorporeal immunoadsorption (ECI); apheresis treatment with protein A immunoadsorption column (Prosorba), which binds RA antibodies before blood is returned to client (RA); performed when other treatments have been ineffective

## ***Nursing Care of Clients with Arthritis***

## **Assessment/Analysis**

1. Extent of range of motion of involved joints; presence of bony deformities

2. History of onset and progression of signs and symptoms, identifying degree to which

pain interferes with daily activities

3. Risk factors such as obesity

## Planning/Implementation

1. Assist with activities that require using affected joints; allow for rest periods
2. Maintain functional alignment of joints
3. Provide range-of-motion exercises up to point of pain, explain that some discomfort is always present; apply heat or cold before exercises if ordered
4. Relieve discomfort and edema with medications or application of heat/cold (warm compresses between 98.6° and 105° F)
5. Allow time to verbalize feelings regarding limited motion and changes in lifestyle; help set realistic goals, focusing on strengths
6. Encourage participation in a weight-loss program if indicated
7. Encourage to follow physical therapist's instruction regarding regular exercise and use of supportive devices to maintain independence; encourage muscle strengthening and stretching to increase joint stability
8. Administer and teach about prescribed pharmacologic therapy (e.g., injectable gold compounds can cause nephrotoxicity and blood dyscrasias; hydroxychloroquine can cause visual disturbances)
9. Provide dietary instructions
  - a. Encourage diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) and vitamin and mineral intake to improve and maintain nutritional status and compensate for nutrient interactions of corticosteroid and other treatment medications (RA, GA); avoid high-purine foods such as organ meats, anchovies, sardines, and shellfish (GA)
  - b. Increase fluid intake to 2000 to 3000 mL daily to prevent formation of calculi; alkaline-ash diet to increase pH of urine, which will reduce precipitation of uric acid and enhance action of drugs such as probenecid (GA)
10. Provide care for client with RA or OA requiring joint replacement (see [Nursing Care of Clients with Fractures of the Extremities](#), [Nursing Care of Clients with Fractures of the Hip](#))
11. Refer client and family to the Arthritis Foundation

## Evaluation/Outcomes

1. Reports reduction in pain
2. Completes ADLs using supportive devices as needed
3. Accepts and adjusts to deformities

## Osteomyelitis

### Data Base

A Etiology and pathophysiology: bone infection by direct or indirect invasion, usually by

*Staphylococcus aureus*; may be acute or chronic

1. Indirect entry: via blood from another site; usually in young males; most often occurs in growing long bones; associated with local trauma
2. Direct entry: extends from open wound to bone via arterial blood; ischemia results in formation of sequestrum (dead bone tissue), leading to chronic osteomyelitis; not age related

#### B Clinical findings

1. Subjective: bone pain and tenderness; malaise; headache
2. Objective: signs of sepsis or tissue infection such as fever; edema and erythema over bone; drainage if chronic; positive culture from bone biopsy and positive radionuclide bone scan; MRI useful in confirmation of diagnosis

#### C Therapeutic interventions

1. Intravenous antibiotic therapy for 4 to 6 weeks followed by oral antibiotics for 2 to 3 months; antibiotic-impregnated beads may be placed in wound
2. Incision and drainage of bone abscess
3. Sequestrectomy: surgical removal of dead, infected bone and cartilage; muscle or bone grafts may be needed
4. Closed suction irrigation system may be applied to wound to eliminate debris
5. Preventive measures include prophylactic antibiotics before and 24 hours after orthopedic surgery; early removal of invasive lines

## ***Nursing Care of Clients with Osteomyelitis***

### **Assessment/Analysis**

1. History of trauma, infections, or surgery
2. Involved tissue for signs of inflammation
3. Onset and characteristics of pain

### **Planning/Implementation**

1. Monitor neurovascular status of extremity
2. Administer prescribed analgesics, antibiotics, and warm soaks
3. Use surgical asepsis for wound care
4. Maintain functional body alignment and promote comfort
5. Use room deodorizer if a foul odor is apparent
6. Allow expression of feelings about length of recovery
7. Encourage nutrient-dense diet to compensate for impact of long-term antibiotic therapy on nutritional status

### **Evaluation/Outcomes**

1. Reports reduction in pain
2. Recovers from infectious process

# Multiple Myeloma

## **Data Base**

### A Etiology and pathophysiology

1. Malignant overgrowth of plasma cells in bone and bone marrow produce a specific nonfunctional immunoglobulin (monoclonal [M] protein); osteoclast activating factor produced by plasma cells and other substances cause bone breakdown; cause unknown
2. Risk factors: exposure to ionizing radiation and occupational chemicals; genetic and viral factors are being studied
3. Incidence is highest in older men

### B Clinical findings

1. Subjective: bone pain (back and ribs); progressive weakness
2. Objective
  - a. CRAB
    - (1) Calcium: hypercalcemia from bone destruction
    - (2) Renal insufficiency: hyperuricemia associated with renal damage
    - (3) Anemia; platelet deficiency; weight loss
    - (4) Bone lesions: punched-out appearance of bones on radiograph; idiopathic bone fractures
  - b. Increased total protein
  - c. Serum electrophoresis for monoclonal protein level to monitor extent of disease
  - d. Presence of Bence Jones protein in urine
  - e. Diagnosis confirmed by bone marrow biopsy

### C Therapeutic interventions

1. Chemotherapeutic agents, especially dexamethasone (Decadron); melphalan (Alkeran), bortezomib (Velcade); thalidomide (Thalomid)
2. Radiation therapy
3. Bone marrow transplantation or peripheral blood stem-cell transplantation
4. Analgesics and opioids for pain
5. Supportive therapy such as transfusions, vertebroplasty with orthopedic cement, bisphosphonates such as pamidronate (Aredia) to strengthen bone

## **Nursing Care of Clients with Multiple Myeloma**

### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Signs of myelosuppression
3. Renal function; precipitation of protein, calcium, and uric acid in urine

### **Planning/Implementation**

1. Encourage expression of feelings about the disease and related therapies
2. Help control pain by relaxation, imagery, distraction, and prescribed analgesics

3. Assist with movement to prevent pathologic fractures; apply back brace if ordered
4. Increase fluid intake to prevent renal damage
5. Administer prescribed medications; teach female client receiving thalidomide to use contraception because it is associated with severe birth defects if taken when pregnant
6. Encourage diet high in nutrient-dense foods, especially those rich in immune-stimulating nutrients selenium and vitamins A, C, and E, as well as protein
7. Provide care to client receiving radiation or chemotherapy (see [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients with Neoplastic Disorders)

## Evaluation/Outcomes

1. Reports decrease in pain
2. Remains free from injury (e.g., fractures, renal damage)

## Degenerative Disk Disease

### Data Base

#### A Etiology and pathophysiology

1. Herniation and protrusion of nucleus pulposus into spinal canal with subsequent compression of cord or nerve roots; usually results from aging or trauma
2. Most common site is lumbosacral area (between L4 and L5), but herniation can occur in cervical region (between C5 and C6 or between C6 and C7)

#### B Clinical findings

1. Subjective
  - a. Lumbosacral disk
    - (1) Acute pain or paresthesias in lower back, radiating across buttock and down leg (sciatic pain); pain increases with activities that raise intraspinal pressure
    - (2) Pain on affected side when raising extended leg
    - (3) Weakness of foot
  - b. Cervical disk
    - (1) Neck pain that may radiate to hand
    - (2) Paresthesias and weakness of affected upper extremity
2. Objective
  - a. Impairment of peripheral reflexes and muscle function
  - b. Defect evident on MRI, myelogram, or CT scan

#### C Therapeutic interventions

1. Bed rest initially during acute phase; physical therapy for muscle strengthening and flexibility
2. Back brace for support; cervical collar or traction
3. Local application of heat or cold
4. NSAIDs, muscle relaxants, analgesics
5. Surgical intervention (for progressive deficit)

- a. Laminectomy: excision of ruptured portion of nucleus pulposus through an opening created by removal of part of a vertebra
- b. Discectomy: removal of herniated disk; cervical discectomy may be performed through an anterior and/or posterior incision; bone grafts and hardware may be used
- c. Microdiscectomy: magnifying lens facilitates removal of pieces of disk that press on nerve; incision generally is 1 inch
- d. Laminotomy: incision into lamina
- e. Spinal fusion: if two or more disks are involved, the affected vertebrae are permanently fused to stabilize spine with bone graft

## ***Nursing Care of Clients with Degenerative Disk Disease***

### **Assessment/Analysis**

1. Characteristics and radiation of pain
2. Contributing factors such as trauma, obesity, degenerative joint disease, scoliosis
3. Posture and gait alterations
4. Extent of muscle strength and sensory function of involved extremities

### **Planning/Implementation**

1. Administer prescribed skeletal muscle relaxants, analgesics, and other medications
2. Provide a firm mattress and/or bed board
3. Ensure that traction and/or braces are applied correctly and maintained and that weights hang freely
4. Assist onto a fracture bedpan to avoid client's need to lift hips
5. Provide frequent back care to relax muscles and promote circulation
6. Support body alignment at all times
7. Use log-rolling to turn: instruct to fold arms across chest, bend knee on side opposite direction of turn, and then roll over
8. Transfer safely; verify order, teach client, assess client's abilities, administer prescribed analgesics, position in functional alignment before transfer, log roll client, use assistive devices
9. Teach importance of weight loss, low-heeled shoes, and body mechanics; to avoid activities that increase intraspinal pressure (e.g., coughing, lifting, straining on defecation)
10. Encourage fluid intake and diet rich in nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) to improve and maintain nutritional status and prevent constipation; administer prescribed stool softeners to prevent straining
11. Provide care for client undergoing disk surgery
  - a. Explain that pain may persist postoperatively because of edema
  - b. Protect airway, particularly after cervical spine surgery
  - c. Place bedside table, phone, and call bell within reach to prevent twisting

- d. Observe dressing for signs of hemorrhage and spinal fluid leakage
- e. Monitor for adequate ventilation in clients who have undergone a cervical laminectomy, discectomy, or fusion
- f. Assess for changes in neurologic function (e.g., motor or sensory changes in extremities)
- g. Assist with back brace or cervical collar if ordered; instruct to wear cervical brace as directed to prevent spinal cord injury
- h. Instruct that pain and muscle spasm will improve gradually

12. Foster independence

13. Encourage prescribed exercises and use of firm mattress and/or bed board

## Evaluation/Outcomes

- 1. Reports reduction in pain
- 2. Remains free from injury
- 3. Increases mobility

## Fractures of the Extremities

### Data Base

A Etiology and pathophysiology

- 1. Break in bone continuity, accompanied by localized tissue response and muscle spasm
- 2. Caused by trauma or bone pathology (e.g., osteoporosis, multiple myeloma, neoplasms)
- 3. Types
  - a. Complete fracture: bone separated into two parts; transverse or spiral
  - b. Incomplete fracture: only part of width of bone broken
  - c. Comminuted fracture: bone broken into several fragments
  - d. Greenstick fracture: splintering on one side of bone, with bending of other side; occurs only in pliable bones, usually in children
  - e. Simple (closed) fracture: bone broken but skin is intact
  - f. Compound (open) fracture: break in skin at time of fracture with or without protrusion of bone
- 4. Stages of healing: formation of a hematoma; fibrocartilage formation; callus formation; ossification; consolidation and remodeling of callus

B Clinical findings

- 1. Subjective: pain aggravated by motion; tenderness; neurovascular changes and numbness
- 2. Objective
  - a. Loss of motion; crepitus (grating sound) heard when affected limb is moved
  - b. Edema; ecchymosis
  - c. X-ray examination reveals break in continuity of bone
  - d. Shortening of extremity caused by change in bone alignment

- e. Muscle spasm
- f. Loss of function
- g. Impaired local circulation (e.g., cool, dusky color, diminished pulses) if arteries are damaged
- h. Shock when accompanied by blood loss

### C Therapeutic interventions

1. Traction may be used to reduce fracture or to maintain alignment of bone fragments until surgery or healing occurs
  - a. Skin traction: weights pull on device (e.g., foam boot) applied to an extremity to exert a straight pull on limb (e.g., Buck extension/traction; often used temporarily to immobilize leg while awaiting surgery for fractured hip)
  - b. Skeletal traction: weights pull on pins surgically attached to bone (e.g., Steinmann pin, Kirschner wire, skeletal tongs, halo traction for cervical fractures)
2. Surgical intervention to align bone (open reduction), often with plates, screws, nails (e.g., intramedullary nails) to hold fracture in alignment (internal fixation)
3. Manipulation to reduce fracture (closed reduction)
4. Application of cast to maintain alignment and immobilize limb; may be plaster or fiberglass
5. External fixation device when fractures accompany soft tissue injury
6. Bone graft and electrical stimulation may be used for nonunion of fractures

## ***Nursing Care of Clients with Fractures of the Extremities***

### **Assessment/Analysis**

1. Ability of client to move extremity
2. Altered appearance of involved body part
3. Factors precipitating injury
4. Neurovascular assessment: 5 Ps—Pain, Pulselessness, Pallor, Paresthesias, Paralysis; soft tissue injury or edema may compromise circulatory or neurologic functioning

### **Planning/Implementation**

1. Provide emergency care
  - a. Evaluate general physical condition; treat for shock (e.g., place in supine position, keep warm)
  - b. Splint extremity in position found before moving; consider all suspected fractures as fractures until radiography is performed
  - c. Cover open wound with sterile dressing if available
2. Monitor for signs of fat emboli after fracture of long bones or pelvic bones: severe chest pain, dyspnea, pallor, diaphoresis, petechiae (on neck, upper arms, chest, abdomen), fever, and decreased oxygen saturation
3. Monitor for compartment syndrome
  - a. Result of excessive tissue pressure within fascial compartment of an extremity that

compromises circulation to the area resulting in ischemia

b. Clinical findings: unrelenting pain; edema; hard, shiny skin; sensory deficits; weak or absent pulses

c. Tissue pressure monitoring device may be used for detection

4. Provide care for a client with a cast

a. Observe for signs of circulatory and neurological impairment: change in skin temperature or color, numbness or tingling, decrease in peripheral pulse, inability to move toes/fingers, swelling, prolonged blanching of toes/fingers after compression, increasing unrelieved pain; notify health care provider

b. Protect cast from damage until dry: elevate extremity with cast on pillow; handle with palms of hands only

c. Promote drying by leaving it uncovered; use a fan to increase circulation of air

d. Maintain bed rest until cast is dry and ambulation is permitted

e. Observe for signs of hemorrhage and circle extent of drainage on cast

f. Observe for irritation caused by rough cast edges, and pad as necessary for comfort and to prevent soiling

g. Administer prescribed analgesics and report unrelieved pain

h. Observe for signs of infection (e.g., elevated temperature, odor from cast, swelling)

i. Teach isometric exercises to prevent muscle atrophy

5. Provide care for a client in traction

a. Ensure that weights are hanging freely and that affected limb is in position so that the pull of traction is not impeded; never interrupt traction

b. Maintain affected extremity in functional alignment; encourage use of trapeze or side rails to facilitate movement; teach how to use trapeze to lift body during linen change to avoid shearing force, which contributes to skin breakdown

c. Observe for footdrop with Buck extension/traction, because this may indicate nerve damage

d. Observe site of insertion of skeletal traction for irritation or infection; use surgical asepsis when cleansing site of insertion of skeletal traction (an antiseptic ointment may be prescribed)

6. Encourage high-protein, high-vitamin diet to promote healing; high-calcium diet is not recommended when on prolonged bed rest because bone decalcification will continue until activity is restored; a high calcium intake may lead to formation of renal calculi

7. Encourage fluids to maintain hydration and help prevent constipation, renal calculi, and urinary tract infection

8. Reposition every 1 to 2 hours, use pressure-relieving devices, and provide skin care to prevent pressure ulcers

9. Teach isometric exercises to promote muscle strength and tone

10. Teach appropriate crutch-walking technique; non-weight-bearing (three-point swing-through); weight-bearing (four point) progressing to use of cane (see [Related Procedures, Mobility: Assistive Devices](#))

## Evaluation/Outcomes

1. Remains free from infection
2. Maintains neurovascular functioning
3. Remains free from complications
4. Regains mobility and function after healing

## Fracture of the Hip

### **Data Base**

#### A Etiology and pathophysiology

1. Fractures of head or neck of femur (intracapsular) or trochanteric area (extracapsular); loss of blood supply to head of femur will result in aseptic necrosis
2. Incidence highest in older females because osteoporosis and degenerative joint disease increase risk of sustaining a fracture from a fall

#### B Clinical findings

1. Subjective: pain; changes in sensation
2. Objective: affected leg appears shorter; external rotation of affected limb; x-ray examination reveals lack of bone continuity

#### C Therapeutic interventions

1. Buck extension/traction as a temporary measure to limit soft tissue injury and relieve pain of muscle spasm; leg is kept extended with slight internal rotation and client's body weight acts as counter-traction; rarely used
2. Open reduction and internal fixation (ORIF)
3. Hemiarthroplasty (replacement of the femoral head) or total hip replacement (THR) when fracture site or joint degeneration will not permit internal fixation; both require total hip precautions

### **Nursing Care of Clients with Fracture of the Hip**

### **Assessment/Analysis**

1. Shortening and external rotation of leg
2. Degree and nature of pain
3. Neurovascular assessment; 5 Ps—Pain, Pulselessness, Pallor, Paresthesias, Paralysis
4. Other health problems that may affect recovery

### **Planning/Implementation**

1. See [Nursing Care of Clients with Fractures of the Extremities](#)
2. Encourage use of trapeze to facilitate movement and prevent shearing force on skin; lift pelvis by using trapeze and unaffected leg
3. Assist onto a fracture bedpan to avoid client's need to lift hips; use elevated commode when allowed out of bed because flexing hip more than 90 degrees must be avoided
4. Provide postoperative care for THR

- a. Monitor neurovascular status
- b. Maintain portable wound suction drainage device (e.g., Hemovac); anticipate up to 500 mL in first 24 hours; usually removed by second postoperative day when daily drainage decreases to approximately 30 mL
- c. Administer prescribed analgesics; patient-controlled analgesia (PCA) and/or continuous regional analgesia (e.g., ropivacaine [Naropin])
- d. Determine if health care provider wants client to turn from side to side or avoid turning on operative side; place pillow between legs when turning on unaffected side; use pillow to maintain abduction after hip replacement and instruct to avoid crossing legs to prevent dislodging prosthesis
- e. Encourage quadriceps setting exercises
- f. Assist client to ambulate; first with a walker and progressing to a cane; support on unaffected side; follow orders for extent of weight-bearing permitted on affected extremity because this depends on type of surgery and type of device inserted
- g. Avoid activities that may dislocate prosthesis (see [Figure 11-6: Total hip replacement: do's and do not's related to body mechanics](#))

**FIGURE 11-6** Total hip replacement: do's and do not's related to body mechanics. Home-going instructions illustrating do's and do not's for clients with a total hip replacement. Clients are to avoid extreme flexion (past 90 degrees), adduction, and internal rotation of operated hip—any of which may cause dislocation of the prosthesis. (From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St. Louis, 2007, Mosby.)

- h. Prevent complication of thromboembolism (e.g., administer anticoagulants, apply antiembolism stockings, encourage dorsiflexion of feet, monitor coagulation profile); observe dressing and under client for bleeding
- i. Prevent pulmonary complications: encourage coughing and deep breathing; teach how to use incentive spirometer; assist with frequent position changes; assess for clinical manifestations of pulmonary embolus (e.g., chest pain, shortness of

breath)

j. Encourage weight reduction if needed

k. Collaborate with other health professionals for physical therapy and rehabilitation

## Evaluation/Outcomes

1. Maintains alignment of affected leg
2. Demonstrates improved mobility
3. Avoids complications of immobility

## Spinal Cord Injury

### Data Base

A Etiology and pathophysiology resulting from trauma

1. Fractures of vertebrae can cut, compress, or completely sever spinal cord
2. Signs and symptoms depend on location (e.g., lumbar, thoracic, cervical) and extent of damage (e.g., complete transection, partial transection, compression) and may be temporary or permanent; sensation and mobility of areas supplied by nerves below level of lesion are affected
3. Highest incidence between ages 16 and 30 years

B Clinical findings

1. Subjective: paresthesias or loss of sensation below level of injury; pain (e.g., cutting, burning, piercing, radiating, tightening) may occur when there is intact sensation
2. Objective
  - a. Inability to move body below level of injury
  - b. Early signs of spinal shock
    - (1) Sudden loss of reflexes below level of injury; particularly bowel and bladder, which may lead to paralytic ileus and urinary retention
    - (2) Flaccid paralysis (immobility accompanied by weak, soft, flabby muscles) below level of injury
    - (3) Neurogenic shock: absence of sympathetic innervation leads to peripheral vasodilation and venous pooling, hypotension, bradycardia, and inability to perspire
  - c. Later signs of spinal cord injury
    - (1) Reflex hyperexcitability (spastic paralysis): muscles below site of injury become spastic and hyperreflexic
    - (2) Diminished reflex excitability (flaccid paralysis) below site of injury follows reflex hyperexcitability in all instances of total cord damage and may occur in some instances of partial cord damage
    - (3) Total cord damage: both upper and lower motoneurons are destroyed; signs and symptoms depend on location of injury; loss of motor and sensory function present at time of damage usually is permanent
      - (a) Sacral region: paralysis (usually flaccid) of lower extremities

- (paraplegia) accompanied by atonic (autonomous) bladder and bowel with impairment of sphincter control
- (b) Lumbar region: paralysis of lower extremities that may extend to pelvic region (usually flaccid) accompanied by a spastic (automatic) bladder and loss of bladder and anal sphincter control
- (c) Thoracic region: same signs as those for lumbar region except paralysis extends to trunk below level of diaphragm
- (d) Cervical region: same signs as those for thoracic region except paralysis extends from neck down and includes paralysis of all extremities (quadriplegia); if injury is above C4, there is an absence of independent respirations
- (4) Partial cord damage: either upper or lower motoneurons, or both, may be destroyed; signs depend not only on location but also on type of neurons involved; destruction of lower motoneurons results in atrophy and flaccid paralysis of involved muscles, whereas destruction of upper motoneurons causes spasticity
- (5) Autonomic dysreflexia (hyperreflexia): exaggerated autonomic response to factors such as a distended bowel or bladder when lesion is above T6; leads to bradycardia, hypertension, headache, piloerection (goose bumps), diaphoresis, and nasal congestion ([Figure 11-7: Autonomic dysreflexia: causes and clinical findings](#))

## C Therapeutic interventions

1. Maintenance of vertebral alignment
  - a. At site of injury, maintain individual in position found until emergency services arrive with a head and back stabilizer for transport
  - b. Bed rest with supportive devices or with total immobilization
  - c. Skeletal traction (e.g., Crutchfield or Vinke tongs; halo device)
  - d. Corsets, braces, and other devices when mobility is permitted
2. Surgery to reduce pain or pressure and/or stabilize spine (e.g., laminectomy, spinal fusion)
3. Respiratory therapy, mechanical ventilation as needed
4. Temperature control via hypothermia
5. High doses of steroids to reduce inflammatory process at site of injury
6. Extensive rehabilitation therapy

## ***Nursing Care of Clients with Spinal Cord Injuries***

### **Assessment/Analysis**

1. Respiratory status
2. Neurologic status (see [Related Procedures, Neurologic Assessment \[Including Glasgow Coma Scale\]](#))
3. Abdomen for bladder or bowel distention
4. Extent and characteristics of pain if present
5. Skin integrity
6. Health problems that impact recovery
7. Coping skills and support systems

### **Planning/Implementation**

1. Monitor cardiovascular, respiratory, and neurologic functioning
2. Maintain spinal alignment at all times; use log-rolling method to turn
3. Maintain in functional alignment; prevent dysfunctional contractures
4. Maintain surgical asepsis with skeletal traction or spinal surgery
5. Institute measures to prevent thrombophlebitis
6. Institute active and passive range-of-motion exercises as soon as approved; exercises may be performed in water
7. Encourage verbalization and accept feelings
8. Include in decision-making process; encourage independence when possible
9. Involve client, family, and entire health team in developing a plan of care
10. Help with adjustment to altered body image, lifestyle, and self-concept
11. Set realistic short-term goals so success can be achieved, promoting motivation
12. Examine skin for signs of pressure from positioning, braces, or splints; use techniques

to prevent pressure; provide skin care; use pressure-relieving devices or beds; reposition every 1 to 2 hours

13. Provide opportunities to touch, grasp, and manipulate objects of different sizes, weights, and textures to stimulate tactile sensation

14. Protect affected limbs during transfer

15. Teach how to use unaffected extremities to manipulate, move, and stabilize affected parts

16. Attempt to establish a scheduled pattern of bowel function

- a. Compare bowel habits before illness to current pattern; establish specific times for bowel movement; schedule evacuation after a meal to utilize gastrocolic reflex (peristaltic wave in colon induced by entrance of food into fasting stomach)
- b. Determine if client senses need to defecate (e.g., feeling of fullness or pressure in rectum, flatus, bowel sounds [borborygmi])
- c. Encourage assumption of a position most near the physiologic position for defecation
- d. Use assistive measures to induce defecation
  - (1) Teach bearing down while contracting abdominal muscles (this technique while closing the glottis [Valsalva maneuver] should be avoided, especially by those with cardiac problems)
  - (2) Teach leaning forward to increase intraabdominal pressure by compressing abdomen against thighs
  - (3) Use digital stimulation
  - (4) Administer prescribed suppository
  - (5) Administer ordered enemas; usually as last resort
- e. Provide diet with bowel-stimulating properties, with emphasis on fruits, vegetables, cereal grains, and legumes, because these are rich sources of dietary fiber; fiber absorbs water, swells, and stretches the bowel, promoting peristalsis
- f. Encourage sufficient fluid intake: 2000 to 3000 mL per day
- g. Encourage activities to develop tone and strength of muscles that can be used
- h. Provide adaptive equipment as necessary (e.g., elevated toilet seat, grab bars, padded backrest)
- i. Teach bowel training program to client and family

17. Attempt to establish bladder function

- a. Determine type of bladder problem
  - (1) Neurogenic bladder: any disturbance in bladder functioning caused by a lesion of nervous system
  - (2) Spastic bladder (reflex or automatic): caused by a spinal cord lesion above bladder reflex center, in conus medullaris; loss of conscious sensation and cerebral motor control; bladder empties automatically when detrusor muscle is sufficiently stretched (about 500 mL) to prevent overdistention
  - (3) Flaccid bladder (atonic, nonreflex, or autonomous): caused by a spinal cord lesion at level of the sacral conus or below; bladder continues to fill, becomes distended, and periodically overflows; bladder muscle does not

contract forcefully and bladder does not empty except with conscious effort

- b. Review bladder habits before illness as well current pattern of elimination; record output, voiding times, and times of incontinence
- c. Encourage activity
- d. Encourage sufficient fluid intake (3000 to 4000 mL per 24-hour period)
- e. Encourage glass of water with each attempt to void; restrict fluid after 6 PM to limit amount of urine in bladder during night
- f. Determine whether client is aware of need to void (e.g., fullness or pressure, flushing, chilling, goose pimples, cold sweats)
- g. Encourage assumption of a position most near the physiologic position for urinating
- h. Teach measures to induce urination
  - (1) Use Credé maneuver: manual expression of urine from bladder with moderate external pressure, downward and backward, from umbilicus to over suprapubic area
  - (2) Bend forward to increase intraabdominal pressure
  - (3) Stimulate “trigger points”: areas that will instigate urination (e.g., stroke thigh, pull pubic hair, touch meatus)
- i. Provide adaptive equipment as necessary (e.g., elevated toilet seats, commode, urinals, drainage systems)
- j. Establish voiding schedule
  - (1) Begin trial voiding at time just before incontinence most often occurs
  - (2) Encourage voiding every 2 hours all day and two to three times at night
  - (3) Time intervals between voidings; should be shorter in morning than later in day
  - (4) Lengthen time between attempts as ability to maintain control improves
  - (5) Maintain consistency of routine

18. Discuss need for sexual expression and options available; include discussion of penile implants

19. Care for client experiencing autonomic dysreflexia

- a. Place in a high-Fowler position
- b. Ensure patency of urinary drainage system
- c. Assess for fecal impaction
- d. Eliminate other stimuli such as drafts
- e. Notify health care provider; administer prescribed antihypertensives

20. When permitted, encourage and support use of tilt table to imitate weight-bearing and reduce loss of calcium from bones caused by immobility

21. Refer client to National Spinal Cord Injury Association

## Evaluation/Outcomes

- 1. Maintains respiratory functioning
- 2. Avoids complications of immobility
- 3. Establishes program to maintain bowel function

4. Establishes program to maintain bladder function
5. Adjusts to changes in lifestyle
6. Functions satisfactorily sexually

## Amputation

### **Data Base**

A Etiology and pathophysiology

1. Surgical removal of an extremity
2. Intervention for conditions (e.g., malignant tumor, arterial insufficiency, extensive trauma, congenital malformation)

B Clinical findings (see [Chapter 6](#), Nursing Care of Clients with Circulatory System Disorders, Vascular Disease: Thrombophlebitis, Varicose Veins, and Peripheral Vascular Disease)

C Therapeutic interventions

1. Below-the-knee amputation (BKA) common in peripheral vascular disease; facilitates successful adaptation to prosthesis because of retained knee function
2. Above-the-knee amputation (AKA) necessitated by severe trauma or extensive disease (e.g., malignant tumors, congenital malformation)

### **Nursing Care of Clients with Amputations**

#### **Assessment/Analysis**

1. History to determine causative factors and health problems that can compromise recovery
2. Neurovascular status of involved extremity
3. Understanding of consequences of surgery
4. Coping skills and support systems

#### **Planning/Implementation**

1. Provide care preoperatively
  - a. Teach exercises to strengthen muscles of extremities in preparation for crutch walking
  - b. Teach coughing and deep-breathing exercises
  - c. Provide emotional support for anticipated alteration in body image
2. Monitor vital signs and dressing for signs of hemorrhage or infection
3. Elevate foot of bed briefly (usually first 24 hours) if ordered by health care provider to decrease edema; avoid elevation of residual limb on a pillow to prevent hip flexion contractures
4. Provide residual limb care
  - a. Maintain elastic bandage to reduce edema and subcutaneous fat and shape residual limb in preparation for prosthesis

- b. Care for incision after it is healed (e.g., wash daily, avoid using oils that may cause maceration)
- c. Apply pressure with progressively firmer surfaces to toughen end of residual limb
- d. Encourage moving affected limb while keeping it in functional alignment
- e. Place client with lower extremity amputation in prone position twice daily to stretch flexor muscles and prevent hip flexion contractures; teach to avoid flexing hip and keeping it in abduction when ambulating
- 5. Teach about phantom limb pain/sensation caused by severed nerves
  - a. Pain/sensation may be constant or intermittent; varies from numbness and tingling to severe pain; may be burning, squeezing, shooting; gradually decreases over 2 years
  - b. Employ techniques that may provide relief (e.g., have client look at residual limb or close eyes and put limb through range-of-motion as if extremity were still there)
  - c. Therapies are available if severe pain persists
    - (1) Transcutaneous electric nerve stimulation (TENS), local anesthetic agents, ultrasound, antidepressants
    - (2) Surgical revision of residual limb
- 6. Consider special needs related to an upper extremity amputation
  - a. Mastery of an upper extremity prosthesis is more complex than that of a lower extremity prosthesis
  - b. Bilateral shoulder exercises are necessary to prepare for fitting the prosthesis
  - c. Artificial arms cannot be used above head or behind back because of harnessing
  - d. An artificial hand cannot duplicate the fine movements of fingers and thumb; development of electronic limbs are addressing these functions
  - e. Loss of sensory feedback necessitates visual control (a blind person could not adequately use a functional prosthesis)
- 7. Support client through fitting, applying, learning, using, and caring for the prosthesis
- 8. Encourage expression of emotions; encourage family to participate in care

## Evaluation/Outcomes

- 1. Remains safe from injury
- 2. Verbalizes acceptance of altered body image
- 3. Uses prosthesis effectively
- 4. Maximizes independence
- 5. Copes with phantom limb sensation/pain

## Cataract

### Data Base

A Etiology and pathophysiology

- 1. Opacity of crystalline lens or its capsule
- 2. Results from aging, injury, infection, cigarette smoking, obesity, diabetes mellitus,

exposure to sun, corticosteroids

## B Clinical findings

1. Subjective: distortion of vision (e.g., haziness, cloudiness, diplopia); photophobia
2. Objective: progressive loss of vision; black pupil appears clouded, progressing to milky white appearance

## C Therapeutic interventions

1. Corrective lenses as vision deteriorates
2. Surgical intervention to remove opaque lens
  - a. Surgery most frequently performed in an ambulatory surgery setting
  - b. Extracapsular extraction: removal of anterior capsule and lens through small incision after lens has been fragmented through a phacoemulsification technique; most common procedure
  - c. Intracapsular extraction: removal of entire lens as a unit
  - d. Intraocular lens implantation usually done at time of cataract extraction
  - e. Corrective lenses after cataract surgery
  - f. Antiemetics, analgesics, and stool softeners postoperatively

## ***Nursing Care of Clients with Cataracts***

### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Visual acuity
3. Characteristics of lens

### **Planning/Implementation**

1. Provide orientation to environment
2. Place call bell, phone, and other items on unaffected side
3. Ensure that there are no glaring lights; encourage wearing dark glasses
5. Ensure that there are no environmental hazards
6. Provide care after cataract removal
  - a. Instruct to prevent pressure on eye (e.g., avoid touching, rubbing, tightly closing eyes, sneezing, bending from waist, coughing, rapid head movements, straining at stool, lifting, lying on affected side)
  - b. Teach about prescribed analgesics, antiemetics, and stool softeners
  - c. Teach to self-administer ophthalmic medications (see [Related Pharmacology, Ophthalmic Agents](#), Nursing Care); take multiple medications exactly as prescribed
  - c. Reduce amount of light and encourage use of sunglasses when eye patch is removed
  - d. Teach signs of increased intraocular pressure (e.g., pain, restlessness, increased pulse rate) and infection (e.g., pain, changes in vital signs)
  - e. Explain that vision may be altered but will clear; prescription glasses may still be

necessary

## Evaluation/Outcomes

1. Remains free from injury
2. Demonstrates increased visual acuity

## Glaucoma

### **Data Base**

#### A Etiology and pathophysiology

1. Pressure within eyeball is higher than expected range of 10 to 21 mm Hg, causing optic nerve damage; increased incidence in older adults
2. Open-angle glaucoma
  - a. Aqueous fluid does not drain adequately from eye; related to pathologic changes in trabecular meshwork or Schlemm canal
  - b. Intraocular pressure increases and destroys retinal nerve fibers, causing progressive vision loss in affected areas
  - c. Most common type of glaucoma
3. Angle-closure glaucoma
  - a. Iris lies close to drainage channels, creating mechanical blockage of trabecular meshwork that interferes with exit of aqueous humor from anterior chamber
  - b. Trapped aqueous humor causes intraocular pressure to increase suddenly
  - c. Occurs more commonly in African-Americans and people older than 60 years

#### B Clinical findings

1. Open-angle glaucoma
  - a. Subjective: halos around lights
  - b. Objective: gradual loss of peripheral vision; increased intraocular pressure (24 to 32 mm Hg) as measured by a tonometer
2. Angle-closure glaucoma
  - a. Subjective: nausea; halos around lights; severe frontal headache
  - b. Objective: loss of peripheral vision; steamy cornea; redness and swelling of conjunctiva; increased intraocular pressure (50 to 70 mm Hg) as measured with a tonometer

#### C Therapeutic interventions

1. Reducing intraocular pressure with topical alpha-adrenergics, prostaglandins, beta blockers, and cholinergics; oral carbonic anhydrase inhibitors
2. Surgical intervention to facilitate aqueous humor drainage: laser iridotomy or trabeculectomy; laser trabeculoplasty; filtering procedures

### **Nursing Care of Clients with Glaucoma**

## Assessment/Analysis

1. History of onset and progression of symptoms
2. Visual acuity; peripheral vision
3. Characteristics of sclera, pupil, and anterior chamber

## Planning/Implementation

1. Teach importance of regular, comprehensive eye examinations including intraocular pressure and visual field mapping to identify and treat forms of glaucoma
2. Explain importance of continued use of prescribed eye medications to prevent further visual loss
3. Teach to avoid increasing intraocular pressure (e.g., exertion, stooping, straining at stool, coughing, or heavy lifting); inform health care providers about presence of glaucoma if atropine therapy is being considered
4. Instruct to report severe eye or brow pain and nausea

## Evaluation/Outcomes

1. Maintains present level of visual acuity
2. Remains free from injury
3. Continues medical therapy and supervision

## Detached Retina

### Data Base

#### A Etiology and pathophysiology

1. Retina separates from choroid and vitreous humor seeps behind retina
2. May result from trauma, aging, or cataract surgery; also occurs in clients with myopia greater than -6 or diabetes mellitus

#### B Clinical findings

1. Subjective: flashes of light; floaters; sensation of a veil in line of sight
2. Objective: loss of vision; retinal separation detected by ophthalmoscopy

#### C Therapeutic interventions

1. Bed rest, with area of detachment in dependent position to promote healing
2. Tranquilizers for rest and to reduce anxiety
3. Surgical intervention
  - a. Cryosurgery: supercooled probe causes retinal scarring to reattach retina
  - b. Photocoagulation: laser beam through pupil produces a retinal burn, which causes scarring of involved area
  - c. Scleral buckling: depressing sclera to force choroid closer to retina
  - d. Pneumatic retinopexy: injection of a gas bubble or other substance into vitreous cavity to apply pressure on detached portion of sensory retina, keeping it in contact with retinal pigment epithelium; used with cryosurgery or photocoagulation
  - e. Vitrectomy: Small incision into sclera to allow for specialized instruments;

vitreous gel is suctioned from inside eye and replaced with gas to reposition retinal layers; body naturally replaces fluid over time as gas is absorbed; may be combined with scleral buckling

## ***Nursing Care of Clients with Detached Retina***

### **Assessment/Analysis**

1. History of onset and progression of symptoms; identification of contributing factors such as trauma or recent eye surgery
2. Visual acuity
3. Status of retina via ophthalmoscopic examination

### **Planning/Implementation**

1. Provide accurate information in a calm voice; client's anxiety is high as a result of sudden, unexpected vision loss
2. Maintain bed rest in position as ordered
3. Provide a call bell and answer promptly
4. Maintain protective eye patch
5. Instruct to avoid activities that increase intraocular pressure (e.g., exertion, stooping, straining at stool, coughing, or heavy lifting)
6. Monitor for signs and symptoms of hemorrhage postoperatively (e.g., severe pain, restlessness)
7. Diminish lights in room
8. Position clients who have had pneumatic retinoplasty so that gas bubble is in best location to seal detachment

### **Evaluation/Outcomes**

1. Reports improved vision
2. Remains free from injury

## **Otosclerosis**

### ***Data Base***

A Etiology and pathophysiology

1. Fixation of stapes caused by growth of bone, preventing transmission of vibrations and resulting in a progressive conductive hearing loss
2. Cause unknown, but incidence higher in females; autosomal dominant trait

B Clinical findings

1. Subjective: hearing loss; possible tinnitus
2. Objective: response to tuning fork indicates bone conduction better than air conduction (Rinne test); spongy bone in labyrinth

C Therapeutic interventions

1. Hearing aids to amplify sound
2. Stapedectomy: removal of affected portion of stapes and replacement with prosthetic implant to conduct vibrations from middle to inner ear

## ***Nursing Care of Clients with Otosclerosis***

### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Extent of hearing loss via audiometry
3. Rinne test to evaluate loss of air conduction

### **Planning/Implementation**

1. Position postoperatively as ordered: lying on operated side facilitates drainage; lying on nonoperated side helps prevent displacement of graft
2. Instruct to alter position gradually to prevent vertigo
3. Monitor for pain, headache, vertigo, or unusual sensations in ear
4. Instruct to avoid sneezing, blowing nose, swimming, showering, and flying until permitted by health care provider; if client must sneeze, instruct to keep mouth open to equalize pressure in ear
5. Explain that hearing will be diminished because of edema from surgery and packing in ear; hearing eventually will improve

### **Evaluation/Outcomes**

1. Reports improved hearing ability
2. Remains free from injury
3. Establishes effective communication

## **Ménière Disease (Endolymphatic Hydrops)**

### ***Data Base***

#### **A Etiology and pathophysiology**

1. Chronic, inner ear disease that incapacitates because of sudden, severe attacks of vertigo
2. Caused by endolymph in vestibular and semicircular canals
3. Incidence highest in males between 20 and 60 years

#### **B Clinical findings**

1. Subjective: vertigo; nausea; headache; tinnitus; sensitivity to loud sounds; sensory hearing loss, usually unilateral; aural fullness
2. Objective: vomiting; diaphoresis; nystagmus during attacks; Weber test and auditory testing document unilateral hearing loss

#### **C Therapeutic interventions**

1. Low-sodium diet

2. Pharmacologic therapy: meclizine (Antivert); diuretics; antihistamines; diazepam (Valium)
3. Destruction of vestibular nerve to control vertigo, which can cause deafness depending on therapeutic approach
4. Insertion of endolymphatic drainage shunt may relieve symptoms without loss of hearing

## ***Nursing Care of Clients with Ménière Disease***

### **Assessment/Analysis**

1. History of onset and progression of symptoms; situations that precipitate attacks
2. History of allergies or infections that may complicate the condition
3. Extent of hearing loss via audiometry
4. Weber test to determine auditory loss

### **Planning/Implementation**

1. Support emotionally
2. Encourage avoidance of rapid movements to limit onset of symptoms
3. Teach self-protection from injury during attack (e.g., pull off road if driving, lie down); maintain bed rest with severe vertigo
4. Teach avoidance of foods high in sodium (e.g., processed meats and fish, cheese, condensed milk, condiments)

### **Evaluation/Outcomes**

1. Reports a reduction in frequency and intensity of vertigo
2. Remains free from injury
3. Establishes effective communication

# CHAPTER 12

# Nursing Care of Clients with Urinary/Reproductive System Disorders

---

# Overview

## Review of Anatomy and Physiology of the Urinary System

### Functions of the Urinary System

A Secrete urine

B Eliminate urine from body

1. Excrete expected and abnormal metabolic wastes
2. Regulate blood pressure and composition and volume of blood; maintain fluid, electrolyte, and acid-base balance

### Structures of the Urinary System

(Figure 12-1: Structures of the male and female urinary systems)

**FIGURE 12-1** Structures of the male and female urinary systems. Sagittal section of the female urinary system (*left*) and male urinary system (*right*), each showing a partially distended bladder. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

### Kidneys

A Located behind peritoneum at level of last thoracic and first three lumbar vertebrae

B Receive 20% of cardiac output during rest; reduced to 2% to 4% during physical or emotional stress

C Nephron

1. Anatomic and functional unit of kidney; approximately 1 million per kidney
2. Function via principles of filtration, reabsorption, and secretion (Figure 12-2: Overview

of urine formation)

**FIGURE 12-2** Overview of urine formation. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

- a. Glomerulus: urine formation starts with filtration; water and solutes (except cellular elements of blood, albumins, fibrinogen, and other blood proteins) filter out of capillaries through glomerular-capsular membrane into the Bowman capsule
- b. Bowman capsule: filtrate collects here before flow to tubules
- c. Tubular reabsorption and secretion
  - (1) Proximal tubule
    - (a) Reabsorption of glucose and other nutrients mainly by active transport
    - (b) Reabsorption of electrolytes from tubule filtrate to blood in peritubular capillaries; forms network of capillaries around tubules; cations (notably sodium) reabsorbed by active transport, stimulated by aldosterone; anions (notably chloride and bicarbonate) are reabsorbed by diffusion
    - (c) Reabsorption of about 80% of water from tubular filtrate to blood by osmosis
  - (2) Loop of Henle: osmotic condition promotes water reabsorption and transports chloride ions from filtrate, thus passively removing sodium ions with chloride
  - (3) Distal tubule
    - (a) Reabsorption of electrolytes, particularly sodium; influenced by

the mineralocorticoid aldosterone

(b) Reabsorption of water into blood by osmosis; controlled by antidiuretic hormone

(c) Secretion of hydrogen, potassium, and ammonia from blood in peritubular capillaries to tubular filtrate, via active transport

D Collecting tubules: final osmotic reabsorption of most of remaining water in urine; under antidiuretic hormone influence

E Urine description/composition

1. 1.5 L/day average (30 mL/hr)
2. Light yellow to dark amber
3. Aromatic odor: food and drugs alter odor and color
4. Specific gravity of 1.005 to 1.030; varies depending on fluid intake and quantity of solutes; lower specific gravity the more dilute the urine; higher specific gravity the more concentrated the urine
5. Acidic (4.5 to 7.5) pH
6. Urea/uric acid: waste products of protein and amino acid metabolism
7. Creatinine: waste product of muscle metabolism
8. Electrolytes: potassium, sodium, calcium, and chloride
9. Hormones and their breakdown products
10. Abnormal constituents: glucose, protein, red blood cells (RBCs), ketone bodies, bilirubin, calculi, and white blood cells (WBCs)

F Urine volume control

1. Glomerular filtration rate (GFR): usually constant (about 125 mL/min); in certain pathologic conditions GFR may change markedly and alter urine volume (e.g., in shock GFR decreases, causing oliguria; decrease in plasma proteins lowers colloid oncotic pressure, increasing GFR)
2. Solutes in tubular filtrate: increase in tubular solutes causes decreased osmosis of water from proximal tubule into blood resulting in increased urine volume (e.g., with diabetes, excess glucose in tubular filtrate leads to increased urine volume [polyuria, diuresis])
3. Aldosterone mechanism: stimulates kidney tubules to reabsorb sodium; water follows the sodium
4. Antidiuretic hormone (ADH): produced in hypothalamus and secreted into blood by posterior pituitary gland; secretion stimulated by increase in osmotic pressure of extracellular fluid or decrease in volume of extracellular fluid; ADH acts on distal and collecting tubules, causing water to move via osmosis from tubular filtrate into blood; increased water reabsorption increases total volume of body fluid by decreasing urine volume

G Control of amount of blood flow through kidneys

1. Reduced renal blood flow results in renal excretion of the hormone renin
2. Renin interacts with blood proteins, producing angiotensin II
3. Angiotensin II causes vasoconstriction and aldosterone secretion, resulting in increased blood pressure and renal blood flow

## Ureters

A Located behind parietal peritoneum; tube from each kidney connects to urinary bladder

B Collect urine secreted by kidney and propel it to bladder by peristaltic waves

## Urinary Bladder

A Located behind symphysis pubis, below parietal peritoneum; three openings—two from ureters and one into urethra

B Reservoir for urine until sufficient amount accumulates for expulsion via urethra

## Urethra

A Tube with mucous membrane lining that ends at urinary meatus, its exterior opening

1. Female: behind symphysis pubis, anterior to vagina

2. Male: extends through prostate gland, fibrous sheet, and penis

B Functions

1. Female: passageway for expulsion of urine

2. Male: passageway for expulsion of urine and semen

# Review of Anatomy and Physiology of the Reproductive System

## *Structures of the Male Reproductive System*

(Figure 12-3: Male reproductive organs)

**FIGURE 12-3** Male reproductive organs. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

## Glands

A Testes: male sex glands (gonads)

1. Located in scrotum, one testis in each compartment
2. Functions
  - a. Seminiferous tubules form spermatozoa (male sex cells or gametes); process called spermatogenesis (occurs at puberty)
  - b. Interstitial cells secrete testosterone, main androgen; increases protein synthesis, induces growth of secondary sex characteristics

B Accessory glands

1. Seminal vesicles: secrete fluid that constitutes about 30% of semen
2. Prostate gland: secretes about 60% of semen; secretion is alkaline, which increases sperm motility; contains the enzyme acid phosphatase; this enzyme increases in metastasizing cancer of prostate
3. Bulbourethral glands (Cowper glands): secrete fluid that lubricates urethra before ejaculation

## Ducts

A Epididymis: conducts semen from testes to vas deferens; sperm mature while semen is stored before ejaculation

B Vas deferens (seminal ducts): conduct sperm and fluid from each epididymis to an ejaculatory duct

C Ejaculatory ducts: ejaculate semen into urethra

D Urethra: see description under [Structures of the Urinary System](#)

## Supporting Structures

A External: scrotum and penis

1. Scrotum: contains testes, epididymis, and first part of seminal duct; sperm develop at 2 to 3 degrees below body temperature (ideal for sperm development)
2. Penis: contains urethra; contains vascular spaces that when filled with blood cause erection

B Internal: fibrous tubes (spermatic cords) located in each inguinal canal; torsion of testes twists cords, destroys sperm, interrupts blood supply, and can result in cell death and gangrene

## Structures of the Female Reproductive System

([Figure 12-4](#): Female reproductive organs)

**FIGURE 12-4** Female reproductive organs. (From Patton KT, Thibodeau GA: *Anatomy and physiology*, ed 7, St. Louis, 2010, Mosby.)

See [Chapter 23, Female Reproductive System](#)

## Review of Microorganisms

### Bacterial Pathogens

A *Enterobacter aerogenes*: gram-negative bacillus; causes urinary tract infections

B *Haemophilus ducreyi*: gram-negative bacillus; causes venereal ulcer called chancroid (soft chancre)

C *Neisseria gonorrhoeae*: gram-negative diplococcus; causes gonorrhea; transmitted sexually

D *Pseudomonas aeruginosa*: gram-negative bacillus; infection characterized by blue-green pus; common secondary invader of wounds, burns, outer ear, and urinary tract; transmitted by catheters and other hospital instruments if contaminated

E *Treponema pallidum*: motile spirochete; causes syphilis; transmitted sexually

F *Chlamydia trachomatis*: parasite characterized as bacteria because of cell wall composition and process of reproduction; reproduce only within cells; causes genital infections in men and women; transmitted sexually

### Protozoal Pathogen

A *Trichomonas vaginalis*: flagellated protozoan; causes trichomonas vaginitis; transmitted sexually

### Viral Pathogens

A Human immunodeficiency virus (HIV): causes acquired immunodeficiency syndrome (AIDS); primarily transmitted sexually and by blood and other body fluids

B Herpesvirus hominis: causes herpes genitalis; transmitted via genital or oral-genital routes

C Human papillomavirus (genital or venereal warts [condylomata acuminata]): characterized by papillary or cauliflower-like masses in or on genitourinary structures; may be precursor to cancer of cervix; vaccine available

## Related Pharmacology

### ***Kidney-Specific Antiinfectives***

#### A Description

1. Antibacterial effect on renal tissue, ureters and bladder
2. Used to treat local urinary tract infections
3. Available in oral and parenteral (IV) preparations

B Examples: nitrofurantoin (Macrobid, Macrochantin)

C Major side effects: anorexia, nausea, vomiting (irritation of gastric mucosa); pseudomembranous colitis; photosensitivity; peripheral neuropathy; blood dyscrasias; hemolytic anemia; hypersensitivity reactions; pneumonitis; chest pain

#### D Nursing care

1. Administer with meals to reduce gastrointestinal (GI) irritation
2. Monitor blood work, cultures, and urinary output
3. Encourage increased fluid intake to promote drug excretion
4. Nitrofurantoin: dilute oral suspensions in milk or juice to prevent staining of teeth; instruct that urine will appear brown

### ***Sulfonamides***

See [Chapter 3, Related Pharmacology, Sulfonamides](#)

### ***Urinary Spasmolytics***

#### A Description

1. Affect smooth muscle of urinary tract
2. Used for symptomatic relief of incontinence

B Examples: flavoxate, oxybutynin (Ditropan, Oxytrol), tolterodine (Detrol); darifenacin (Enablex)

C Major side effects related to anticholinergic effect: tachycardia, palpitations, dry mouth, constipation, drowsiness, blurred vision, urinary retention, allergic reaction

#### D Nursing care

1. Do not administer if GI obstruction is present
2. Administer cautiously to clients with glaucoma
3. Advise to avoid driving and other hazardous activities; avoid hot environments
4. Monitor urinary output

# **Androgens**

## A Description

1. Hormones that promote secondary sex characteristics in men; have anabolic properties; stimulate building and repair of body tissue
2. Used in debilitating conditions and inoperable breast cancer; restore hormone levels in males; treat fibrocystic breast disease, dysmenorrhea, and severe postpartum breast engorgement in nonbreastfeeding mothers
3. Available in oral, parenteral (intramuscular [IM], subcutaneous [Sub-Q]), and buccal preparations

## B Examples: fluoxymesterone, danazol

## C Major side effects

1. Weight gain, edema (sodium and water retention); changes in libido (androgen effect); hoarseness, deep voice (virilism— androgen effect); gastroenteritis; emotional lability
2. Fluoxymesterone: hepatocellular carcinoma, acne, dyspepsia, jaundice, hypoglycemia, hypercalcemia

## D Nursing care

1. Assess for virilization in females; gynecomastia in men
2. Encourage diet high in calories and proteins to aid in building body tissues and low in sodium to limit edema
3. Administer with meals to reduce GI irritation
4. Monitor blood pressure
5. Assess for potentiation of anticoagulant effect when receiving concomitant anticoagulant therapy

# **Estrogens**

See [Chapter 23, Related Pharmacology, Estrogens](#)

# **Progestins**

See [Chapter 23, Related Pharmacology, Progestins](#)

# **Related Procedures**

## **Urinary Catheterization**

### A Definitions

1. Sterile introduction of catheter through urethra into bladder
2. Intermittent (straight) catheterization: to drain urine, obtain urine specimen, or determine residual volume (amount of urine left in bladder after voiding)
3. Indwelling (retention) catheterization: inflated balloon holds catheter in place; attached to collecting bag; urine is continually emptied by gravity

### B Nursing care

1. Explain procedure; provide privacy
2. Position client: female—supine with knees flexed and abducted; male—supine with

knees slightly abducted

3. Use sterile technique; test balloon by inflating and deflating before insertion
4. Place sterile fenestrated drape over external genitalia, exposing meatus
5. Cleanse urinary meatus using cotton balls saturated with suitable solution
  - a. Female: separate labia minora with thumb and forefinger and cleanse from anterior to posterior using one pledget for each stroke (keep labia separated during cleansing)
  - b. Male: hold penis between thumb and forefinger perpendicular to body and cleanse from meatus to shaft using one pledget for each stroke (retract foreskin during procedure and replace after procedure)
6. Insert lubricated catheter into bladder
  - a. Female: about 3 inches (7.5 cm) or slightly past point at which urine returns
  - b. Male: about 7 to 10 inches (17 to 25 cm) or well past point at which urine returns
  - c. Attempt balloon inflation; if resistance is met, deflate balloon, insert catheter farther, and reattempt inflation
7. Drain urine slowly by gravity
  - a. Intermittent catheterization: remove catheter when bladder is empty
  - b. Retention catheterization: inflate balloon with sterile solution and place closed collection system below level of bladder; hang bag from bed frame, not siderails
8. Assist to comfortable position and document procedure
9. Ensure patency of catheter (e.g., eliminate kinks, dependent loops, and clogs); secure catheter to client's leg to prevent telescoping action in urethra
10. Wash genital area with soap and water daily and as necessary
11. Keep system closed at all times; collect urine specimen from port along tubing using sterile technique
12. Monitor output hourly if critically ill
13. Prepare for removal of indwelling catheter by intermittently clamping tubing to restore muscle tone; dribbling and incontinence may occur temporarily after catheter is removal due to flaccidity of urinary sphincter; monitor for urinary output of sufficient quantity (200 mL or more) within 6 to 8 hours after removal

## ***Continuous Bladder Irrigation (CBI)***

### **A Definition**

1. Instillation of sterile isotonic solution into bladder through triple-lumen catheter: one for instillation of fluid into balloon tip, one for instillation of fluid into bladder, and one for return of fluid and urine from bladder ([Figure 12-5: Continuous bladder irrigation](#))

**FIGURE 12-5** Continuous bladder irrigation (CBI). (From Potter PA, Perry AG: *Fundamentals of nursing*, ed 7, St. Louis, 2009, Mosby.)

2.

B

Nursing care

1.

2.

3.

4.

5.

Connect catheter port to irrigant via intravenous tubing using sterile technique

Set rate of infusion as ordered (e.g., flow should be sufficient to keep drainage pink); if

red, bloody drainage or clots occur, CBI should be increased to achieve pink drainage;

assess for occlusion if urinary output stops abruptly

Maintain infusion continuously, observing color, clarity, and amount of drainage

Assess for clinical findings of dilutional hyponatremia

Deduct irrigant from total urinary output to calculate actual urine output

# Major Disorders of Urinary/Reproductive Systems

For additional disorders see [Chapter 24, Nursing Care Related to Major Disorder Affecting Women's Health](#)

## Urinary Tract Infections (UTIs)

### **Data Base**

A Etiology and pathophysiology

1. Cystitis: inflammation of bladder wall usually caused by ascending bacterial infection (*Escherichia coli* most common)
  - a. Females: more common because of shorter urethra, childbirth, anatomic proximity of urethra to rectum
  - b. Males: secondary to epididymitis, prostatitis, renal calculi
2. Urethritis: inflammation of urethra caused by staphylococci, *E. coli*, *Pseudomonas* species, and streptococci
  - a. Although inflammation is present, clinical findings are similar to gonorrheal urethritis, sexual contact is not the cause
  - b. May cause prostatitis and epididymitis
3. Urosepsis: caused by gram-negative bacteria
  - a. May result from indwelling urinary catheter or untreated urinary tract infection
  - b. Can lead to septic shock and death

B Clinical findings

1. Subjective: urgency; frequency; pain when initiating, during, and completion of urination; males—prostate tenderness with rectal exam
2. Objective: nocturia, hematuria, pyuria, cloudy urine, positive urine culture; males—prostate enlargement with rectal exam

C Therapeutic interventions

1. Urine culture: to identify causative organism
2. Pharmacologic therapy: antibiotics, urinary antiseptics, antispasmodics
3. Diet: directed toward altering properties of urine (e.g., cranberry juice—contributes to hostile environment for bacterial growth; elimination of caffeine, which causes bladder irritability)
4. Additional fluids: dilute urine
5. Warm sitz baths: provides comfort
6. Antiseptic solution: installation via urethral catheter
7. Urosepsis: IV therapy with aminoglycosides; beta-lactam antibiotics, aztreonam (Azactam); used with probenecid to increase therapeutic level of drug

### **Nursing Care of Clients with Urinary Tract Infections**

### **Assessment/Analysis**

1. Urine for color, clarity, odor, blood, or mucus; dysuria; burning; discharge

2. Suprapubic area for bladder distention

## Planning/Implementation

1. Obtain urine specimen for culture and sensitivity before administering prescribed antibiotics; refrigerate specimen if it cannot be sent to laboratory immediately
2. Administer aminoglycoside medication; monitor for nephrotoxicity and respiratory paralysis; encourage increased fluid intake to avoid nephrotoxicity, neurotoxicity and ototoxicity.
3. Teach to seek medical attention at first sign of clinical findings and to take medications as directed
4. Encourage intake of additional fluids
5. Teach preventive measures (e.g., perineal care, avoiding tub baths, voiding after intercourse, wearing cotton underwear)
6. Teach those at risk for recurrent UTIs that frequent follow-up care with culture and sensitivity testing of urine if indicated

## Evaluation/Outcomes

1. Expresses relief of pain on urination
2. Resumes expected urinary patterns
3. Describes methods to prevent recurrence of infection

## Urolithiasis and Nephrolithiasis

### **Data Base**

A Etiology and pathophysiology: formation of stones in urinary tract; composed of calcium phosphate, uric acid, or oxalate; tend to recur and may cause obstruction, infection, and/or hydronephrosis

B Clinical findings

1. Subjective: severe pain in kidney area radiating down flank to pubic area (renal colic); frequency; urgency; nausea; history of associated health problems (e.g., gout, hyperparathyroidism, immobility, dehydration, UTIs)
2. Objective: diaphoresis, pallor, grimacing, vomiting, hematuria, and pyuria if infection is present

C Therapeutic interventions

1. Opioids: morphine (Astramorph, Duramorph) drug of choice for parenteral use
2. Nonsteroidal antiinflammatory drugs (NSAIDs) for pain: ketorolac (Toradol, Acular); only NSAID approved for parenteral use in United States.
3. Antispasmodics to reduce renal colic
4. Antiemetics: metoclopramide (Reglan)
5. Allopurinol (Zyloprim, Alopri-m) to reduce uric acid excretion
6. Antibiotics to reduce infection
7. Intake and output (I&O); strain urine

8. Diet therapy
  - a. Large fluid intake to produce dilute urine
  - b. Diet altered according to type of stone
    - (1) Calcium stones: low-calcium diet (400 mg daily), elimination of dairy products; phosphate involvement: limitation of high-phosphorus foods (e.g., dairy products, meat); oxalate involvement: avoidance of oxalate-rich foods (e.g., tea, almonds, cashews, chocolate, cocoa, beans, spinach, rhubarb); acid-ash diet to create acidic urinary tract: include whole grains, eggs, and cranberry juice while excluding vegetables, fruit, milk, and cheese; supplements of riboflavin, vitamins A and C, and folic acid
    - (2) Uric acid stones: metabolic product of purines; limitation of purine foods (e.g., meat [especially organ meats], meat extracts, and to a lesser extent whole grains and legumes); alkaline-ash diet because stone composition is acetic
    - (3) Cystine stones (rare): decreased methionine intake because methionine is the essential amino acid from which cystine is formed; limitation of protein foods (e.g., meat, milk, eggs, cheese); alkaline-ash diet to create alkaline urinary tract: include fruits and vegetables while restricting milk, meat, fish, eggs, cereal, and cheese
9. Surgery if stone is not passed or complications are present (e.g., nephrolithotomy, ureterolithotomy, cystolithectomy)
10. Percutaneous ultrasonic lithotripsy (PUL)
  - a. Nephroscope inserted through skin into kidney
  - b. Ultrasonic waves disintegrate stones; removed by suction and irrigation
  - c. Less traumatic alternative to surgery
11. Laser lithotripsy: utilizes lasers with ureteroscope
12. Extracorporeal shock wave lithotripsy (ESWL): client is exposed to shock waves that disintegrate stones, which are passed with urine

## ***Nursing Care of Clients with Urolithiasis and Nephrolithiasis***

### **Assessment/Analysis**

1. Vital signs, particularly temperature, for baseline data
2. Urine for color, clarity, pH, odor
3. Urine for presence of stones (strain all urine); I&O

### **Planning/Implementation**

1. Administer analgesics as prescribed
2. Encourage to set own pattern of activity; provide periods for undisturbed rest
3. Encourage fluid intake of 3000 to 4000 mL daily
4. Administer antibiotics as prescribed to prevent infection
5. Encourage to remain on diet; teach to read labels on food for presence of

contraindicated additives (e.g., calcium, phosphate)

6. Encourage daily weight-bearing exercise, when not contraindicated, to prevent hypercalciuria caused by release of calcium from bones
7. Provide care after nephrolithotomy or PUL
  - a. Maintain patency of urethral catheter to prevent hydronephrosis; call health care provider if urine output is less than 50 mL/hr
  - b. Encourage use of incentive spirometry and coughing and deep breathing to prevent atelectasis
  - c. Nephrolithotomy: change dressings frequently during first 24 hours postoperatively

## Evaluation/Outcomes

1. States relief of pain
2. Establishes expected urine flow
3. Describes strategies for prevention of stone formation

## Acute Kidney Failure

### Data Base

A Etiology and pathophysiology

1. Sudden and almost complete loss of glomerular and/or tubular function
2. Progression from anuric or oliguric phase through diuretic phase to convalescent phase (takes up to 6 to 12 months) before return of function; may progress to chronic renal failure
3. Acidosis, potassium intoxication, pulmonary edema, or infection may result in death
4. Causes: trauma to kidneys; overwhelming physiologic stress (e.g., burns, septicemia, nephrotoxic drugs and chemicals, hemolytic blood transfusion reaction, severe shock, renal vascular occlusion); results in decreased blood flow to glomeruli or nephrons

B Clinical findings

1. Subjective: irritability; headache; anorexia; nausea; circumoral numbness; tingling of extremities (hypocalcemia); lethargy; drowsiness that can progress from stupor to coma
2. Objective
  - a. Sudden drop in urinary output apparent a few hours after causative event; output less than 400 mL but more than 100 mL/24 hours (oliguria); output less than 100 mL/24 hours (anuria)
  - b. Restlessness, twitching, seizures
  - c. Vomiting
  - d. Skin pallor, anemia, increased bleeding time: can progress to epistaxis and internal hemorrhage
  - e. Ammonia (urine) odor to breath; perspiration; can progress to uremic frost on skin and pruritus
  - f. Generalized edema, hypervolemia, hypertension, increased venous pressure; can

progress to pulmonary edema and heart failure

g. Deep, rapid respirations to compensate for metabolic acidosis

h. Elevated serum levels of blood urea nitrogen (BUN), creatinine, potassium, and phosphorus; decreased blood pH, carbon dioxide combining power, and serum levels of calcium and sodium

i. Albumin in urine, decreased urine specific gravity

### C Therapeutic interventions

1. Correct underlying cause of acute renal failure (e.g., treat shock, eliminate drugs and toxins, treat transfusion reactions, restore integrity of urinary tract)

2. Complete bed rest

3. Diet therapy

a. Calories: (2000 to 2500) and protein adequate for maintenance and to prevent tissue breakdown; low to moderate protein (30 to 50 g) according to tolerance; high carbohydrate for energy (300 to 400 g); moderate fat (70 to 90 g)

b. Sodium: controlled according to serum levels and excretion tolerance (400 to 2000 mg)

c. Potassium: controlled according to serum levels and excretion capacities (1300 to 1900 mg)

d. Water: controlled according to excretion (800 to 1000 mL)

e. Calcium: 1000 mg to prevent or delay progression of renal osteodystrophy or demineralization of bone resulting from chronic acidosis and altered vitamin A metabolism

f. Calcium supplements: when serum phosphate level is under control to decrease risk of precipitation of calcium phosphate in kidney

g. Phosphorus: less than 600 mg/day to delay progression of renal insufficiency; restriction of milk (1 cup or less per day), meats, poultry, fish, eggs, and cereal grain products; avoidance of soft drinks and beer

h. Renal diet: low in water-soluble vitamins, iron, and zinc

i. Vitamin and mineral supplements because of dietary restrictions; daily supplements of vitamin B<sub>6</sub> (5 to 10 mg), vitamin C (70 to 100 mg), and folic acid (1 mg) for dialyzed clients

j. Total parenteral nutrition (TPN) and parenteral intralipid therapy

4. Packed RBCs, electrolytes, and glucose IV as necessary

5. Exchange resins to decrease serum potassium level

6. Antibiotics to reduce possibility of infection

7. Peritoneal dialysis, hemodialysis, or hemofiltration

## ***Nursing Care of Clients with Acute Kidney Failure***

### **Assessment/Analysis**

1. Daily weight, fluid balance, electrolytes, BUN, and creatinine levels

2. Clinical findings of hyperkalemia and hyponatremia

### 3. History of clinical findings and potential causative factors

## Planning/Implementation

1. Monitor I&O and hourly urine/output; assess for overhydration (e.g., pitting, dependent, sacral, or periorbital edema; crackles or dyspnea; headache, distended neck veins, hypertension)
2. Promote fluid and electrolyte balance by monitoring, replacing, or limiting fluids and electrolytes as ordered
3. Provide periods of undisturbed rest to conserve energy and oxygen
4. Protect from injury caused by bleeding tendency, possibility of seizures, and clouded sensorium
5. Monitor for complications (e.g., hemorrhage, seizures, cardiac problems, pulmonary edema, infection)
6. Provide special skin care to prevent breakdown and remove uremic frost if present
7. Encourage intake of ordered diet; allow choices in selection of food while recognizing that little variation is possible
8. Support client receiving peritoneal dialysis, hemodialysis, or hemofiltration

## Evaluation/Outcomes

1. Maintains fluid and electrolyte balance within acceptable limits
2. Adheres to treatment protocols
3. Maintains nutritional status
4. Remains free from injury

## Chronic Kidney Failure/End-Stage Renal Disease

### Data Base

#### A Etiology and pathophysiology

1. Result from chronic kidney infections, developmental abnormalities, vascular disorders, and destruction of kidney tubules
2. Progressive deterioration of renal function results in uremia

#### B Clinical findings

1. Subjective: lethargy, drowsiness, headache, nausea, pruritus
2. Objective
  - a. Oliguria, anuria, vomiting, anemia, hypertension, anasarca, uremic frost, urochromatic pigmentation (bronze pigmentation)
  - b. Decreased serum calcium level (causing tetany) and pH (metabolic acidosis), increased serum phosphate and potassium levels, azotemia, renal osteodystrophy as seen on radiograph
  - c. Kussmaul respirations, mental clouding, seizures, coma, death

#### C Therapeutic interventions

1. Fluid and sodium restriction

2. Antihypertensive medications
3. Epoetin alpha (Epogen) to manage anemia
4. Dietary management
  - a. Very low protein (20 g); minimal essential amino acids causes body to use own excess urea nitrogen to synthesize nonessential amino acids needed for tissue protein production
  - b. Control intake of electrolytes, especially potassium (1500 mg)
  - c. See [Acute Kidney Failure](#) for additional diet therapy information
5. Continuous arteriovenous hemofiltration (CAVH); some elements in plasma cross semipermeable membrane due to differences in hydrostatic pressure; previously established fistulas or externally placed access points used; driving force is client's blood pressure
6. Peritoneal dialysis: dialyzing solution is introduced via catheter inserted in peritoneal cavity; peritoneal membrane is used as dialyzing membrane to remove toxic substances, metabolic wastes, and excess fluid
  - a. Intermittent: involves 6 to 48 hours several times a week
  - b. Continuous ambulatory peritoneal dialysis (CAPD): involves approximately three or four exchanges daily; can be administered at home
  - c. Continuous cycler-assisted peritoneal dialysis (CCPD): uses machine to fill and empty abdomen three to five times during night while sleeping. Morning exchange lasts all day; additional exchange may be done in afternoon to increase waste removal
  - d. Combination of CAPD and CCPD implemented during day and or night to achieve most effective exchange
7. Hemodialysis: performed via surgically created arteriovenous fistula or loop graft (see [Figure 12-6: Types of access for hemodialysis](#)); machine pumps blood along semipermeable membrane; dialyzing solution is on other side of membrane, and osmosis and/or diffusion of client's wastes, toxins, and fluid occurs

B

**FIGURE 12-6** Types of access for hemodialysis. **A**, Arteriovenous fistula. **B**, Artificial loop graft. (From Mahan LK, Escott-Stump S: *Krause's food and nutrition therapy*, ed 12, St. Louis, 2008, Saunders.)

8. Kidney transplantation from compatible donor
  - a. Human leukocyte antigen (HLA) tests and tissue and blood typing decrease risk for rejection; least risk for rejection if donor and recipient are identical twins
  - b. Client's kidney is not removed unless it is infected or enlarged; new kidney is placed in iliac fossa retroperitoneally and donor's ureter is attached to bladder to prevent reflux of urine
  - c. Steroids and immunosuppressives: cycloSPORINE (Sandimmune, Gengraf); everolimus (Zortress)

## ***Nursing Care of Clients with Chronic Kidney Failure/End-Stage Renal Disease***

### **Assessment/Analysis**

1. Urinary elimination: hourly output; characteristics (e.g., color, consistency, odor, amount)
2. Vital signs
3. Electrolyte status
4. Neurologic status: attention span, weakness, neuropathies
5. Breath for ammonia odor
6. Skin for color and uremic frost
7. Complications: bleeding because of impaired platelet function; infections associated with dialysis (e.g., pneumonia, infected vascular access site)
8. Emotional status of client and significant others

### **Planning/Implementation**

1. Monitor vital signs, I&O
2. Provide skin care
3. Evaluate understanding of restricted diet; encourage adherence
4. Provide general care associated with dialysis
  - a. Explain procedure and answer questions; assure that staff member is available at all times
  - b. Weigh before and after procedure
  - c. Take vital signs before and after and every 15 minutes during procedure; assess for hypotension and hemorrhage
  - d. Use surgical asepsis to prepare site (e.g., abdomen or area of fistula); if abdominal catheter is not in place for peritoneal dialysis, have client void before catheter is inserted

- e. Check tubes for patency
  - f. Provide back care to promote comfort; diversional activities to help pass time during prolonged procedure
  - g. Refer for nutrition counseling; stress importance of lifelong dietary modifications
  - h. Monitor for electrolyte imbalances particularly those associated with potassium and sodium
5. Provide specific care associated with peritoneal dialysis
- a. Keep accurate flow chart
  - b. Instill dialysate at slow steady rate over 10 to 20 minutes
  - c. Monitor for respiratory distress; drain abdomen if respiratory distress occurs
  - d. Reposition to promote drainage from abdomen
  - e. Wash catheter site with soap and water during daily shower
  - f. Protect site with gauze dressing
  - g. Monitor for peritonitis
  - h. Monitor serum glucose levels
6. Provide specific care associated with hemodialysis
- a. Monitor for patency of internal fistula between treatments by palpating for thrill and auscultating for bruit
  - b. Monitor site for clotting; check clotting time; administer heparin as prescribed
  - c. Protect access device from trauma, manipulation, and contamination (e.g., avoid taking blood pressure or blood from arm with arteriovenous fistula, use sterile technique)
7. Provide care associated with kidney transplantation
- a. Prepare client and family emotionally for possible outcomes of surgery
  - b. Maintain patency of drainage tubes, including retention catheter; urine is expected; gross hematuria or clots are not expected
  - c. Monitor fluid balance; initial output is increased because of sodium diuresis; sharp decrease may signal rejection
  - d. Monitor serum electrolytes, BUN, and creatinine
  - e. Monitor weight and vital signs, particularly temperature; isolation may be necessary to prevent infection
  - f. Teach how to prevent infection: avoid crowds; use aseptic technique, especially thorough hand hygiene
  - g. Monitor for opportunistic infections (e.g., candidiasis, cytomegalovirus, and *Pneumocystis jiroveci* pneumonia)
  - h. Administer steroids and immunosuppressives as prescribed to prevent rejection; explain need for lifelong immunosuppressive therapy; monitor for nephrotoxicity and hepatotoxicity
  - i. Monitor for and teach clinical manifestations of rejection (e.g., malaise, fever, flank pain or tenderness, decreasing urinary output)

## Evaluation/Outcomes

- 1. Maintains fluid and electrolyte balance within expected limits
- 2. Remains free from infection

3. Adheres to dietary and fluid restrictions
4. Verbalizes feelings
5. Describes clinical findings of transplant rejection

## Adenocarcinoma of the Kidney

### **Data Base**

#### A Etiology and pathophysiology

1. Most common cancer affecting kidneys; incidence higher in males
2. Common sites of metastasis include lungs, liver, and long bones

#### B Clinical findings

1. Subjective: may be absent until metastasis occurs, dull back pain, weakness
2. Objective: weight loss, anemia, increased temperature, painless hematuria, and enlarged kidney palpable during physical examination

#### C Therapeutic interventions

1. Radical nephrectomy
2. Partial nephrectomy (heminephrectomy) when neoplasm is bilateral or if only one kidney is functioning
3. Radiation therapy if tumor is sensitive
4. Chemotherapy
  - a. Hormonal therapy: medroxyPROGESTERone (Provera)
  - b. Multikinase inhibitors: decrease renal cell tumor growth and angiogenesis; e.g., sorafenib (Nexavar)
  - c. Protein-tyrosine kinase inhibitors: interfere with tumor receiving blood and nutrients needed for tumor growth; e.g., sunitinib (Sutent)
  - d. Mammalian target of rapamycin (mTOR) antagonists: enzyme inhibitors; e.g., temsirolimus (Torisel); everolimus (Afinitor); used when sunitinib and sorafenib fail.
5. Palliative care if condition is terminal

### **Nursing Care of Clients with Adenocarcinoma of the Kidney**

#### **Assessment/Analysis**

1. Hematuria, pain
2. Flank regions for asymmetry

#### **Planning/Implementation**

1. Monitor intake and output I&O; increase fluids
2. Administer analgesics as prescribed
3. Observe urine for color, amount, and abnormal components
4. Support natural defenses (e.g., encourage intake of foods rich in immune-stimulating nutrients, especially vitamins A, C, and E, and selenium)

5. Provide care after nephrectomy
  - a. Encourage coughing and deep breathing while splinting incision
  - b. Examine dressing and linen under client; more serosanguineous drainage is expected after partial nephrectomy than total nephrectomy
  - c. Maintain integrity of urinary drainage system; avoid kinking of tubes; output should exceed 30 mL/hr

## Evaluation/Outcomes

1. States reduction in pain
2. Discusses feelings related to prognosis
3. Maintains expected urine output

## Glomerulonephritis

### **Data Base**

#### A Etiology and pathophysiology

1. Damage from filtration and trapping of antigen-antibody complexes within glomeruli; inflammatory and degenerative changes affect all renal tissue
2. Often follows streptococcal infection (e.g., tonsillitis)
3. May be acute or chronic; decreases life expectancy if renal damage progresses
4. Complications: hypertensive encephalopathy, heart failure, infection

#### B Clinical findings

1. Subjective: flank pain, costovertebral tenderness, headache, visual disturbances, malaise, weakness, fatigue, anorexia, dyspnea resulting from salt and fluid retention
2. Objective: fever, tachycardia, hypertension, oliguria, periorbital and facial edema; blood, protein and casts in urine; elevated plasma, BUN, and creatinine levels; anemia

#### C Therapeutic interventions

1. Antibiotics to treat underlying infection
2. Dietary restriction of sodium, fluids, and protein based on clinical status
3. Diuretics and angiotensin-converting enzyme (ACE) inhibitors or angiotensin II receptor agonists to treat high blood pressure
4. Corticosteroids may relieve some symptoms; immunosuppressants depending on cause of condition
5. Rest; regular activity when hematuria and proteinuria resolve
6. Temporary dialysis
7. Plasmapheresis (removes antibodies from blood) when condition is due to immune-related causes
8. Dialysis for end-stage renal disease while awaiting transplantation or when it is not possible due to health status

### **Nursing Care of Clients with Glomerulonephritis**

## Assessment/Analysis

1. History of recent upper respiratory tract or skin infections, or invasive procedures
2. Blood pressure for baseline data
3. Urine for blood, protein
4. Presence of dyspnea, edema, neck vein engorgement

## Planning/Implementation

1. Monitor I&O, daily weight, urine specific gravity
2. Monitor vital signs, particularly temperature; protect from infection
3. Provide prophylactic skin care to prevent skin breakdown
4. Monitor for complications (e.g., renal failure, heart failure, and hypertensive encephalopathy)
5. Monitor urinalysis, serum electrolytes, BUN, and creatinine levels
6. Encourage continued medical supervision
7. Refer for case management as needed; long-term prognosis may create economic and familial problems

## Evaluation/Outcomes

1. Maintains fluid balance within acceptable limits
2. Maintains nutritional status
3. Describes clinical findings of complications

## Bladder Tumors

### **Data Base**

#### A Etiology and pathophysiology

1. Staging:
  - a. I: found deep in lining of bladder, no spread to bladder muscle
  - b. II: spread to bladder muscle
  - c. III: spread to tissue surrounding bladder, may involve prostate in men and vagina in women
  - d. IV: extends to wall of abdomen/pelvis, may involve lymph nodes and parts of body far away from bladder (e.g., lungs)
2. Common sites of metastasis: lymph nodes, bone, liver, lungs
3. Risk factors: smoking, radiation, exposure to certain chemicals over prolonged time, schistosomiasis
4. Most frequent in men older than 50 years of age

#### B Clinical findings

1. Subjective: frequency and urgency of urination, dysuria
2. Objective: painless hematuria, direct visualization by cystoscopic examination with bladder washings

#### C Therapeutic interventions

1. Surgical intervention
  - a. Resection of tumor
  - b. Cystectomy may be partial (results in a decreased capacity) or radical (requires urinary diversion)
    - (1) Ileal conduit: section of ileum is resected and attached to ureters; one end of ileal segment is sutured closed and other is brought to skin as an ileostomy to drain urine; technique most widely used to divert urine; appliance needed to collect continuous flow of urine
    - (2) Continent ileal urinary reservoir (e.g., Indiana, Florida, Koch, or Charleston pouch) similar to ileal conduit, but nipple-like valve allows for draining when a catheter is inserted
    - (3) Nephrostomy: catheter inserted in kidney through an incision
    - (4) Ureterostomy: ureters implanted in abdominal wall to drain urine
    - (5) Neobladder: new bladder is created internally; urethra and external anatomy are unchanged
2. Radiation therapy; may be done to shrink tumor before surgery; may be external or internal
3. Chemotherapy
  - a. Superficial bladder cancer: intravesical chemotherapy via catheter through urethra; liquid drugs are instilled for several hours once a week for several weeks or several times monthly up to a year.
  - b. Later stage bladder cancer: systemic chemotherapy
4. Intravesical biological therapy: bacille Calmette Guérin (BCG) solution contains live weakened bacteria that stimulate immune response to destroy cancer cells in bladder; once a week for 6 weeks

## ***Nursing Care of Clients with Bladder Tumors***

### **Assessment/Analysis**

1. Abdomen for bladder distention
2. Urine for hematuria

### **Planning/Implementation**

1. Allow time to verbalize fears about surgery, cancer, death, and body image alterations
2. Assess color and amount of urine (at least 50 mL/hr); maintain patency of drainage system; turn and position to promote urine flow
3. Prepare bowel preoperatively with laxatives, antibiotics, and enemas as prescribed
4. Care associated with ileal conduit
  - a. Cleanse skin around stoma and under drainage bag with soap and water; inspect for excoriation
  - b. Dry skin, apply skin adhesive to area around stoma, apply collection device
  - c. Maintain urinary drainage bag; ensure it is fitted snugly around but not touching

stoma

- d. Encourage self-care; teach to change appliance
5. Care associated with continent ileal urinary reservoir:
  - a. Teach to insert catheter through nipple valve to drain urine
  - b. Teach to drain urine at prescribed times to prevent absorption of metabolic wastes from urine as well as urine reflux into ureters
6. Expect variety of psychologic manifestations (e.g., denial, anger, depression)
7. Arrange visit from member of ostomy club
8. Support client's natural defenses (e.g., encourage intake of foods rich in immune-stimulating nutrients, especially vitamins A, C, and E, and selenium)

## Evaluation/Outcomes

1. Discusses feelings
2. Demonstrates effective care of stoma and appliance

## Benign Prostatic Hyperplasia

### Data Base

A Etiology and pathophysiology

1. Slow enlargement of prostate gland; constricts urethra with subsequent interference in urination; predisposes to hydronephrosis
2. Common in men older than 40 years of age

B Clinical findings

1. Subjective: frequency, urgency, difficulty initiating stream (hesitancy), feeling of incomplete emptying of bladder after urination
2. Objective: nocturia, hematuria, decreased force of stream, urinary retention; enlarged prostate on digital rectal examination or transurethral ultrasound; biopsy reveals hyperplasia rather than malignancy

C Therapeutic interventions

1. Watchful waiting if no obstruction and growth is slow
2. Relief of acute obstruction by insertion of indwelling or suprapubic cystostomy catheter
3. Pharmacologic management
  - a. 5- $\alpha$ -Reductase inhibitors: block uptake and utilization of androgens by prostate, reducing glandular hyperplasia; finasteride (Proscar), dutasteride (Avodart)
  - b.  $\alpha_1$ -Adrenergic receptor blocking agents: terazosin (Hytrin)
  - c. Urinary antiseptics and antibiotics to prevent infection from stasis of urine
4. Laser treatment
  - a. Interstitial laser coagulation: heat energy conducted through fiberoptic probe coagulates obstructing prostate tissue; requires urinary catheter for 1 to 3 days; clinical manifestations resolve over 6 to 12 weeks as tissue is absorbed
  - b. Photoselective vaporization of prostate (PVP): high-energy laser vaporizes excess

prostate tissue via endoscope device inserted into urethra; may require catheterization for 24 hours; usually can resume regular activity the next day; provides immediate and long-lasting results

- c. Holmium laser ablation of prostate (HoLAP): laser vaporization of obstructive prostatic tissue; used when prostate is smaller than 60 cubic centimeters; urinary catheter removed same day or morning after intervention
- d. Holmium laser enucleation of prostate (HoLEP): entire removal of prostate with holmium laser; seals blood vessels; shorter catheterization time than with surgical removal of prostate

#### 5. Microwave treatment

- a. Delivers transurethral microwave energy to heat and destroy excessive prostate tissue
- b. Examples: Cooled thermo Therapy (TUMT); Core Therm; TherMatrix; Prolieve thermodilatation system

#### 6. Additional minimally invasive therapies

- a. AquaTherm: uses water-induced thermotherapy (WIT) to destroy obstructive prostatic tissue; urethral catheter is necessary for 4 to 7 days after procedure
- b. Prostiva RF Therapy: low level radio frequency energy to destroy excess prostatic tissue via two electrodes inserted into prostate through urethra; used for men older than 50 years of age; urethral catheter may be necessary 3 to 5 days after procedure
- c. Transurethral vaporization of the prostate (TUVP): direct application of heat to prostate tissue with grooved roller-bar instrument; provides quick improvement of clinical manifestations

#### 7. Surgery

- a. Transurethral: instruments inserted through urethra; transurethral ultrasound-guided laser incision of prostate (TULIP), transurethral incision of prostate (TUIP), and transurethral resection of prostate (TURP)
- b. Suprapubic: requires incision of abdomen and bladder
- c. Retropubic: requires abdominal incision
- d. Perineal: requires perineal incision; highest risk for incontinence, impotence, and wound contamination

#### 8. CBI after surgery to promote hemostasis and limit clots that block catheter

#### 9. Transurethral dilatation of prostate: reduction of obstruction of urethra via balloon catheter, stent, or coils

## ***Nursing Care of Clients with Benign Prostatic Hyperplasia***

### **Assessment/Analysis**

- 1. Urinary function for frequency, urgency, hesitancy; size and force of stream
- 2. Suprapubic area for bladder distention

### **Planning/Implementation**

1. Encourage increased fluid intake (2400 to 3000 mL/day)
2. Administer antiseptics and antibiotics as prescribed to prevent or treat urinary tract infections after urine for culture is obtained
3. Instruct to avoid anticholinergics and antihistamines because they can cause urinary retention
4. Encourage/assist to standing position to void; moist heat or warm shower may relax urinary sphincter
5. Provide care after prostate surgery
  - a. Monitor for hemorrhage (e.g., change in vital signs, pain, clinical findings of shock, frank bleeding)
  - b. Maintain patency of catheter (e.g., unobstructed gravity flow, adequate fluid intake, CBI, sterile irrigation as ordered); bladder distention and pain may indicate catheter obstruction
  - c. Monitor output; volume of irrigant must be subtracted from drainage when CBI is used (see [Continuous Bladder Irrigation](#) under Related Procedures)
  - d. Prevent hemorrhage (e.g., administer prescribed stool softeners to prevent straining and pressure on operative site, advise to avoid prolonged sitting)
  - e. Maintain suprapubic and cystotomy catheters after suprapubic prostatectomy; change dressings frequently after removal of catheter because of urine leakage
  - f. Encourage to discuss concerns about sexual functioning
  - g. Provide as much privacy as possible
  - h. Instruct to perform perineal exercises to regain urinary control (initially dribbling is common); notify health care provider if urinary stream decreases because it may indicate urethral stricture

## Evaluation/Outcomes

1. Verbalizes concerns about urinary and sexual functioning
2. Achieves expected pattern of urinary elimination

## Cancer of the Prostate

### Data Base

#### A Etiology and pathophysiology

1. Slow, malignant change in prostate gland; spreads by direct invasion of surrounding tissues; metastasizes to bony pelvis and spine
2. Risk factors: aging; family history; prostate-specific antigen (PSA) level more than 2 ng/mL at 60 years of age

#### B Clinical findings

1. Subjective: frequency; urgency; difficulty initiating stream; back, groin, or lower abdominal pain
2. Objective
  - a. Decreased force of stream, urinary retention

- b. Elevated levels of acid phosphatase, carcinoembryonic antigen (CEA), and PSA; alkaline phosphatase level rises with bone metastasis
- c. Digital rectal examination (DRE) reveals enlarged hardened prostate; transurethral ultrasound (TRUS) reveals mass, detects nonpalpable masses
- d. Radiolabeled monoclonal antibody capromab pendetide with indium-111 (ProstaScint): antibody attracted to prostate-specific membrane antigen on prostate cancer cells; radioactive element is then visualized on scanning; detects metastasis before or after treatment
- e. Biopsy demonstrates malignancy; Gleason grading system classifies stage and grade of prostate cancer

### C Therapeutic interventions

1. Watchful waiting for clients with low Gleason score, low PSA levels, and nonpalpable tumors
2. Type of surgery depends on extent of lesion, client's physical condition, and client's acceptance of outcome (e.g., risk of impotence following radical prostatectomy)
3. Radical prostatectomy: open or laparoscopic approach; removes seminal vesicles, portion of bladder neck, nearby lymph nodes, and nerve bundles if necessary
4. Radiation therapy: reduces size of lesion and limits metastases; alone or in conjunction with surgery preoperatively or postoperatively
  - a. External: high doses of external-beam radiotherapy
  - b. Internal: seeds, wires or catheter deliver radioactive substance directly into or near cancer cells
5. Hormone therapy
  - a. Luteinizing hormone-releasing hormone agonists: prevent testes from producing testosterone; leuprolide (Lupron Depo, Eligard), goserelin (Zoladex)
  - b. Antiandrogens
    - (1) Block action of androgens: flutamide, nilutamide (Nilandron)
    - (2) Prevent adrenal glands from making androgens: used in advanced prostatic cancer; ketoconazole (Nizoral)
  - c. Estrogens: prevent testes from producing testosterone; rarely used because of serious side effects
6. Chemotherapy: DOXOrubicin (Doxil), estramustine (Emcyt), etoposide (Toposar), mitoxantrone (Novantrone), paclitaxel (Taxol), docetaxel (Taxotere), vinBLAStin (Velban)
7. Cryosurgery and cryotherapy: needles apply freezing gases to prostate
8. Autologous cellular immunotherapy: sipuleucel-T (Provenge "vaccine") stimulates immune system to fight prostate cancer
9. Orchiectomy: limits production of testosterone; slows progression

## ***Nursing Care of Clients with Cancer of the Prostate***

### **Assessment/Analysis**

1. Progression of urinary clinical findings; presence, extent, and location of pain

2. Alterations in urinary functioning
3. Clinical manifestations of metastasis to bone, lungs, liver, or kidneys

## Planning/Implementation

1. Provide care similar to that for client who has undergone prostate surgery for benign prostatic hyperplasia (see [Nursing Care under Benign Prostatic Hyperplasia](#))
2. Explain development of secondary female characteristics result from estrogen therapy, not surgery
3. Allow time and opportunity to discuss concerns about diagnosis of cancer and impotence; support client's male image
4. Monitor for evidence of metastasis
5. Provide care for client receiving radiation (see [Chapter 3, Neoplastic Disorders, Radiation and General Nursing Care of Clients with Neoplastic Disorders](#))

## Evaluation/Outcomes

1. Verbalizes concerns regarding sexuality and prognosis
2. Maintains expected pattern of urinary elimination
3. Maintains satisfying sexual expression

## Cancer of the Testes

### Data Base

#### A Etiology and pathophysiology

1. Most are germ cell tumors (e.g., seminomas, embryonal carcinomas, teratomas, and choriocarcinomas)
2. Metastasizes to retroperitoneal nodes, lungs, and central nervous system (CNS)
3. Etiology unknown; contributing factors include infection, cryptorchidism, genetic predisposition, and altered hormone levels
4. Leading cause of death from cancer in men 20 to 35 years old

#### B Clinical findings

1. Subjective: heaviness or dull ache in scrotal area; backache or abdominal pain
2. Objective
  - a. Weight loss, enlarged testes, palpable mass, hydrocele
  - b. Elevated tumor markers: alpha-fetoprotein, beta-human chorionic gonadotropin
  - c. Computed tomography (CT) scan of chest and abdomen may show metastasis

#### C Therapeutic interventions

1. Intervention based on cellular classification and staging
2. Orchiectomy (removal of the testis): radical inguinal orchiectomy and high ligation of spermatic cord is classic intervention
3. Retroperitoneal lymph node dissection (RPLND)
4. Radiation; internal or external
5. Combination chemotherapy regimens: involve complex cycles and day intervals;

bleomycin, etoposide, cisplatin (BEP); cisplatin, vinBLAStine, bleomycin (PVB); paclitaxel, ifosfamide, cisplatin (TIP); etoposide, ifosfamide, cisplatin, mesna (VIP) regimen for clients with underlying lung disease.

6. Palliative chemotherapy: gemcitabine/oxaliplatin (GEMOX)
7. Stem cell transplantation
8. Semen cryopreservation: done before start of radiographic diagnostic evaluation and therapy
9. Follow-up monitoring: serum markers for response to therapy alpha-fetoprotein (AFP) and human chorionic gonadotropin (hCG); periodic abdominal CT scans and monthly chest x-rays for 2 to 3 years

## ***Nursing Care of Clients with Cancer of the Testes***

### **Assessment/Analysis**

1. Palpation of testes for enlargement
2. Evidence of metastasis (e.g., back pain, dyspnea, cough, dysphagia, altered mental state, visual changes)

### **Planning/Implementation**

1. Discuss banking sperm before treatment because of risk for sterility
2. Encourage discussion of feelings
3. Provide care related to chemotherapy or radiation (see [Chapter 3, Neoplastic Disorders, Radiation and General Nursing Care of Clients with Neoplastic Disorders](#))

### **Evaluation/Outcomes**

1. Verbalizes feelings about sexuality, treatment, and prognosis
2. Maintains satisfying sexual expression

## CHAPTER 13

# Nursing Care of Clients with Infectious Diseases

---

# Overview

See [Chapter 3](#), Infection, for additional information

# Related Procedures: Standard and Transmission-Based Precautions

See [Chapter 3, Table 3-1](#): Precautions to Prevent the Spread of Microorganisms

# Major Infectious Diseases

## Gas Gangrene

### Data Base

#### A Etiology and pathophysiology

1. Anaerobic gram-positive clostridium (e.g., *Clostridium perfringens*, *Clostridium welchii*, *Clostridium novyi*) enters through a deep wound
2. Bacilli colonize in muscle tissue around wound; occurs 2 to 5 days after injury

#### B Clinical findings

1. Subjective: pain, chills, anorexia, apprehension
2. Objective
  - a. Bronzed or blackened wound tissue; crepitus; sweetish, foul-smelling watery exudate; muscle swelling; necrosis of muscle tissues
  - b. Pallor, diarrhea, vomiting, elevated temperature (may be slight)
  - c. Presence of *Clostridia* on culture, low hemoglobin level

#### C Therapeutic interventions

1. Multiple incisions for decompression and drainage
2. Complete removal (extirpation) and debridement of involved tissue followed by copious irrigations
3. Antibiotics: penicillin G, tetracycline, chloramphenicol, or erythromycin, depending on culture and sensitivity (C&S) results
4. Analgesics as necessary
5. Anticoagulants to prevent blood clots
6. Electrolytes IV to replenish deficiencies
7. Amputation of affected body part
8. Hyperbaric oxygenation
9. Whole blood, packed RBCs, or plasma transfusions to combat hemolysis and profound anemia
10. Antitoxin therapy may be started

### Nursing Care of Clients with Gas Gangrene

#### Assessment/Analysis

1. Wound for specific clinical manifestations
2. Systemic clinical manifestations
3. Results of culture and sensitivity tests

#### Planning/Implementation

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Prevent further infection from fecal contamination (organism found in feces)

3. Use standard and contact precautions
4. Monitor fluid, electrolyte, and cardiovascular status
5. Administer medications as prescribed

## Evaluation/Outcomes

1. Remains free of complications
2. Resolves and remains free of infection

## Toxoplasmosis

### Data Base

#### A Etiology and pathophysiology

1. Protozoan (*Toxoplasma gondii*) contracted by eating raw meat containing cysts or exposure to contaminated cat feces
2. Prenatal transmission can cause congenital anomalies or fetal death; mother may be asymptomatic
3. Most common opportunistic central nervous system (CNS) infection of those with AIDS
4. Leading cause of encephalitis in immunosuppressed clients

#### B Clinical findings

1. Subjective: malaise, fatigue, headache, sore throat, muscle aches and pains
2. Objective: fever, seizures, rash, cognitive and motor impairment, lymphadenopathy, positive cultures, brain abscesses

#### C Therapeutic interventions

1. Pharmacological therapy for pregnant women and immunosuppressed clients: spiramycin (can be obtained with special permission from the U.S. Food and Drug Administration [FDA]); pyrimethamine (Daraprim); sulfADIAZINE (SSD); folinic acid; azithromycin (Zithromax); clindamycin HCl (Cleocin); leucovorin calcium preservative free
2. Usually no treatment required for otherwise healthy adults

### Nursing Care of Clients with Toxoplasmosis

### Assessment/Analysis

1. Objective and subjective clinical manifestations
2. Presence of pregnancy
3. Culture results

### Planning/Implementation

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Use standard precautions

3. Encourage diet rich in nutrient-dense foods
4. Teach clients who are pregnant or have a weakened immune system how to decrease risk of infection (e.g., avoid cleaning cat litter pans; avoid gardening where exposed to cat feces; appropriately handle, prepare, and store meat; wash fruits and vegetables)

## Evaluation/Outcomes

1. Remains free from infection
2. Continues with follow-up supervision as necessary

## Malaria

### Data Base

#### A Etiology and pathophysiology

1. Protozoan (e.g., *Plasmodium falciparum*, *Plasmodium vivax*, *Plasmodium ovale*, *Plasmodium malariae*) enters body from bite by infected Anopheles mosquito, use of dirty needles, transfusion from infected donor
2. Parasite enters bloodstream and invades RBCs; destroys RBCs, blocks capillaries, and causes irreversible damage to spleen and liver
3. Blackwater fever: rare complication with mortality of 20% to 30%; causes intravascular hemolysis, hemoglobinuria, and acute kidney failure
4. Sickle cell trait provides natural resistance

#### B Clinical findings

1. Subjective: malaise, headache, muscle aches, chills, thirst
2. Objective
  - a. High fever, anemia, enlarged spleen, dehydration, renal failure
  - b. Blackwater fever: jaundice, dark red or black urine

#### C Therapeutic interventions

1. Antimalarial drugs: pyrimethamine/sulfadoxine (Fansidar), mefloquine, primaquine, quinine
2. Aspirin
3. Prevention: chemoprophylaxis 1 week before visiting endemic areas and regularly while in area; avoidance of stagnant pools; use of insect repellents and protective clothing to prevent mosquito bites

### Nursing Care of Clients with Malaria

### Assessment/Analysis

1. Objective and subjective clinical manifestations
2. Clinical manifestation of progression to blackwater fever

### Planning/Implementation

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at

## Risk for Infection

2. Monitor fluid and electrolyte balance; maintain hydration
3. Use therapeutic measures to decrease fever (e.g., fluids, tepid bath, light clothing, hypothermia blanket if ordered)
4. Maintain bed rest until fever and other clinical manifestations have ceased
5. Support natural defense mechanisms; encourage intake of nutrient-dense foods (e.g., fruits, vegetables, whole grains, and legumes) and foods high in immune-stimulating nutrients (e.g., selenium and vitamins A, C, and E)
6. Reinforce importance of medication regimen; when receiving quinine: teach to take medication with meals to reduce GI irritation and monitor for symptoms of cinchonism (e.g., tinnitus, vertigo, and deafness) (quinine made from cinchona bark)

## Evaluation/Outcomes

1. Continues prophylaxis as necessary
2. Understands that organism is always present in blood

## Rabies (Hydrophobia)

### Data Base

#### A Etiology and pathophysiology

1. Rhabdovirus (*Lyssavirus rabidus*) enters body through bite of infected animal; animal can be ill or a carrier
2. Virus spreads from soft tissue surrounding wound to peripheral nerves and ultimately affects CNS; may cause punctate hemorrhages and neuronal destruction
3. Incubation period 10 to 50 days with bites in upper parts of body, 4 months with bites in lower parts
4. Bites usually are unprovoked; suspected animals are observed for 10 days

#### B Clinical findings

1. Subjective
  - a. Anxiety, depression, malaise, lethargy, irritability, headaches, stiff neck; photophobia, dyspnea
  - b. Thirst, anorexia, nausea
  - c. Paresthesia or pain near bite or in bitten extremity
2. Objective
  - a. Respiratory difficulty (e.g., wheezing, hyperventilation, spasms)
  - b. Hydrophobia: sight, sound, or thought of water triggers painful pharyngeal muscle contractions that expel fluid from mouth
  - c. Excessive salivation, frothy drooling, difficulty swallowing, choking
  - d. Nuchal rigidity, seizures
  - e. Apnea, cardiac dysrhythmias
  - f. Paralysis, coma

#### C Therapeutic interventions

1. Cleansing of wound with soap and water
2. Human rabies immune globulin (Imogam Rabies-HT, hyperRAB) for passive immunity; dose given in buttock; wound is bathed with drug
3. Human diploid cell vaccine (Imovax Rabies) to induce active immunity
  - a. Prevention for those at risk (e.g., veterinarians, animal handlers): three doses (initial dose, second dose on 7th day, and third dose 2 to 3 weeks later)
  - b. Treatment after exposure: 6 doses (initial dose and then second, third, fourth, and fifth doses at 1-week intervals followed by sixth dose 90 days after event); early treatment is necessary because once disease develops, it usually is fatal
4. Sedatives or anesthetics as necessary; phenytoin (Dilantin) used for seizures
5. Tracheostomy if severe respiratory impairment develops

## **Nursing Care of Clients with Rabies**

### **Assessment/Analysis**

1. Objective and subjective clinical manifestations
2. Wound and/or extremity of bite
3. Manifestation of hydrophobia

### **Planning/Implementation**

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Avoid contact with saliva of infected client
3. Monitor blood gases, fluid and electrolyte balance, and electrocardiograms (ECGs)
4. Keep room dark and quiet to limit agitation
5. Monitor tracheostomy and suction secretions as needed
6. Prevent drafts, which may result in respiratory spasms
7. Encourage client/family to verbalize feelings

### **Evaluation/Outcomes**

1. Recovers after vaccine is administered
2. Avoids contact with potential sources of infection
3. Function returns to body part affected by bite

## **Rocky Mountain Spotted Fever**

### **Data Base**

A Etiology and pathophysiology

1. Microorganism (*Rickettsia rickettsii*) enters body through bite of infected tick; person may not be aware of tick bite
2. Sudden onset: incubation period 3 to 17 days
3. Organism attacks endothelial cells and extends into vessel walls, causing thrombi,

inflammation, and necrosis

## B Clinical findings

1. Subjective: malaise, insomnia, headache, anorexia, photophobia, joint and muscle discomfort, hearing loss
2. Objective
  - a. Fever, enlarged spleen, hypotension, circulatory collapse, renal collapse
  - b. Rash (rose-colored macules), edema, subcutaneous hemorrhage, necrosis

## C Therapeutic interventions

1. Prompt recognition and treatment vital
2. Antibiotics: tetracycline, chloramphenicol; continued until afebrile for 3 to 5 days
3. Treatment of clinical manifestations and complications as they develop

## ***Nursing Care of Clients with Rocky Mountain Spotted Fever***

### **Assessment/Analysis**

1. Objective and subjective clinical manifestations
2. Integument for characteristic changes
3. Circulatory and renal complications

### **Planning/Implementation**

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Assure family that client's disturbed emotional responses are associated with the infection
3. Monitor to determine progression of disease
4. Assess cardiovascular status to determine developing circulatory collapse
5. Reassure hearing loss is temporary
6. Teach prevention (e.g., wear tick repellents, tuck pants into boots, wear long-sleeve shirts, check legs, pants and animals for ticks)
7. Teach to remove ticks with tweezers to ensure complete removal and prevent contamination of fingers

### **Evaluation/Outcomes**

1. Continues with follow-up supervision as necessary
2. Avoids contact with potential sources of infection

## **Lyme Disease**

### ***Data Base***

#### A Etiology and pathophysiology

1. Spirochete bacteria (*Borrelia burgdorferi*) enters body through bite of carrier tick that acquired bacterium from infected host; most often carried by mice, deer, or raccoons;

cats, dogs, and horses may be carriers

2. Tick injects spirochete-laden saliva into bloodstream; incubates 3 to 32 days; then migrates outward, causing a rash
3. Initial rash and flulike clinical findings; later neuromusculoskeletal and cardiac clinical findings
4. Most common vector-borne illness in United States
5. Infectious organism can survive in host 10 years or more

#### B Clinical findings

1. Subjective: chills, muscle aches, joint pain, headache, dizziness, stiff neck, nausea
2. Objective
  - a. Fever; red-ringed, circular rash (erythema chronicum migrans, bull's-eye lesion); swollen joints; lack of coordination; facial palsy; paralysis; dementia
  - b. Blood tests: antibody titers, enzyme-linked immunosorbent assay (ELISA), Western blot assay; positive results may indicate past or current infection

#### C Therapeutic interventions

1. Early Lyme disease: amoxicillin (Amoxil)
2. Severe Lyme disease: ceftriaxone sodium (Rocephin), penicillin G

## ***Nursing Care of Clients with Lyme Disease***

### **Assessment/Analysis**

1. Specific clinical findings, especially red-ringed, circular rash
2. Chronic complications of arthritis, persistent fatigue, CNS and cardiac problems

### **Planning/Implementation**

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Assure family that client's disturbed emotional responses are associated with the infection
3. Monitor to determine progression of disease
4. Question clients with arthritic clinical manifestations about possible exposure
5. Teach prevention
  - a. Avoid tall grass and wooded areas; use chemical repellents; wear light colors to enhance tick identification; wear long sleeves and pants tucked in high boots when walking in areas with tick infestation
  - b. Shower and inspect skin
  - c. Remove ticks with tweezers, grasping close to skin to avoid breaking mouth parts of tick
6. Advise to receive vaccine if at risk
7. Administer antibiotics as prescribed

### **Evaluation/Outcomes**

1. Continues follow-up supervision as necessary
2. Avoids contact with potential sources of ticks

## Tetanus (Lockjaw)

### **Data Base**

#### A Etiology and pathophysiology

1. Anaerobic bacillus (*Clostridium tetani*) enters body through open wound; clinical manifestations 2 days to 3 weeks after exposure
2. Toxins from bacillus invade nervous tissue, motor and sensory nerves become hypersensitive, results in prolonged muscle contractions and respiratory failure

#### B Clinical findings

1. Subjective: irritability, restlessness, pain from muscle spasms
2. Objective: muscle rigidity, spastic contractions of voluntary muscles, spasm of masticatory muscles (trismus), spasms of respiratory tract, grotesque grinning expression (risus sardonicus) caused by spasms of facial muscles

#### C Therapeutic interventions

1. Prompt recognition of potential contamination and treatment vital
2. Tetanus immune globulin (TIG) used to provide temporary passive immunity; tetanus toxoid adsorbed vaccine (Te Anatoxal Berna) may be given in different site
3. Supportive therapy after clinical manifestations develop because specific therapy is ineffective; necessary until toxins reduce over time
4. Maintenance of adequate pulmonary ventilation
5. Debridement of wound to allow exposure to air
6. Sedatives to limit muscle spasms
7. Antibiotics to limit secondary infection
8. Maintenance of fluid balance and nutrition via enteral feedings

### **Nursing Care of Clients with Tetanus**

#### **Assessment/Analysis**

1. Specific clinical manifestations
2. Characteristics of wound

#### **Planning/Implementation**

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Administer tetanus toxoid to provide active immunity; prophylaxis in suspect injuries
3. Initiate seizure precautions; maintain quiet environment to decrease excessive stimuli and prevent seizures
4. Monitor respiratory status; administer oxygen as needed; maintain mechanical ventilation if ordered

5. Suction airway as necessary to maintain patency and promote ventilation; keep endotracheal tube and tracheostomy set at bedside
6. Encourage client/family to verbalize feelings
7. Encourage revaccination (“booster shot”) every 10 years

## Evaluation/Outcomes

1. Maintains active immunity
2. Seeks medical assistance with potentially infectious injuries

## Typhoid Fever

### Data Base

#### A Etiology and pathophysiology

1. Bacterium (*Salmonella typhi*) found in human feces; transmitted through sewage, flies, and shellfish; incubation period 3 to 20 days
2. Bacterium invades GI tract and localizes in lymph tissue of intestinal wall (Peyer patches); these areas may become thrombosed and tissue sloughs off
3. Complications: hemorrhage, peritonitis, perforation, hepatitis

#### B Clinical findings

1. Subjective: headache, drowsiness
2. Objective: fever, bradycardia, rose-colored papules on abdomen, enlarged spleen and liver, delirium, constipation during early stage, diarrhea during late stage

#### C Therapeutic interventions

1. Antibiotics: Ciprofloxacin (Cipro), azithromycin (Zithromax), ampicillin (Principen)
2. Corticosteroids first 4 to 5 days of treatment
3. Maintenance of fluid balance and nutrition
4. Symptomatic treatment

## Nursing Care of Clients with Typhoid Fever

### Assessment/Analysis

1. Specific clinical manifestations
2. Signs of complications

### Planning/Implementation

1. See [Chapter 3](#), Integral Aspects of Nursing Care, General Nursing Care of Clients at Risk for Infection
2. Maintain safety if delirious
3. Encourage soft diet rich in high-nutrient density and high-calorie foods
4. Employ methods to decrease fever
5. Monitor fluid and electrolytes
6. Use contact precautions, in addition to standard precautions, if client is incontinent of

feces

7. Encourage client/family to verbalize concerns precipitated by illness
8. Educate public to prevent disease through appropriate sewage treatment
9. Encourage vaccination programs with booster injections every 3 years in endemic areas

## Evaluation/Outcomes

1. Maintains active immunity
2. Practices effective personal hygiene

## Viral and Bacterial Infectious Gastroenteritis

### Data Base

#### A Etiology and pathophysiology

1. Inflammation of stomach and intestines; usually related to contaminated water and food
2. *Staphylococcus aureus*: clots plasma (coagulase positive); most virulent type; causes variety of infections
  - a. Found in unrefrigerated creams, mayonnaise, stuffing, meats, and fish
  - b. Transmitted to food on hands of food handlers
  - c. Incubation period: 1 to 6 hours after ingestion of contaminated food; illness lasts 24 to 48 hours
3. *Clostridium botulinum* (botulism): life-threatening, often fatal form; exotoxin is most powerful biologic toxin known
  - a. Found in inadequately processed foods, mostly canned foods
  - b. Blocks neuromuscular transmission in cholinergic nerve fibers by binding with acetylcholine
  - c. Incubation period 12 to 36 hours after ingestion of contaminated food; may be 4 to 8 days
4. *Salmonella* (salmonellosis): local GI infection; organisms multiply in intestines but do not enter circulation
  - a. Found in inadequately cooked meats
  - b. Incubation period: 10 to 24 hours after ingestion of contaminated food; illness lasts 2 to 3 days
5. *Clostridium difficile*: spore-forming gram-positive bacteria
  - a. Frequent cause of agency-acquired infection; occurs in clients receiving antibiotic therapy
  - b. Toxin can cause pseudomembranous colitis and sepsis
6. Vancomycin-resistant enterococcus (VRE): gram-positive bacteria that reside in the healthy GI tract
  - a. Frequent cause of agency-acquired infection
  - b. May resist all antimicrobial agents

#### B Clinical findings

1. Subjective
  - a. Nausea, malaise, abdominal cramps and pain
  - b. Botulism: diplopia, muscle weakness, dysphasia
2. Objective
  - a. Diarrhea 1 to 8 hours after ingestion of contaminated food/fluid
  - b. Vomiting, fever, chills
  - c. Botulism: diminished visual acuity and gag reflex, loss of pupillary light reflex
- C Therapeutic interventions
  1. Elimination of chemical, mechanical, and/or thermal irritation
  2. Adequate fluid and electrolytes orally or parenterally
  3. Bed rest
  4. For botulism
    - a. Darkened room
    - b. Parenteral feedings to prevent aspiration
    - c. Tracheostomy and other supportive measures
    - d. Cathartics and cleansing enemas to remove toxins from GI tract
    - e. Trivalent antitoxins as necessary
    - f. Gastric lavage
  5. For *C. difficile*
    - a. Discontinuation of antibiotic therapy if implicated as cause
    - b. Antiinfectives: metronidazole (Flagyl), vancomycin for moderate to severe symptoms
    - c. Surgical intervention for pseudomembranous colitis if necessary

## ***Nursing Care of Clients with Infectious Gastroenteritis***

### **Assessment/Analysis**

1. History of ingestion of contaminated foods
2. Frequency and characteristics of stool
3. Temperature for baseline data
4. Presence of nausea, vomiting, abdominal cramps
5. Clinical findings of fluid and electrolyte imbalance
6. Botulism: establish neurologic baseline data, especially gag reflex

### **Planning/Implementation**

1. Obtain stool specimen for culture
2. Offer small amounts of fluids as tolerated; maintain IV fluids
3. Maintain contact precautions; use meticulous hand washing technique
4. Monitor clients who are immunocompromised or receiving antimicrobial therapy for profuse watery diarrhea indicative of *C. difficile*
5. Teach importance of appropriate storage and cooking of foods
6. Provide care associated with botulism

- a. Prevent aspiration pneumonia by elevating head of bed; keep suction equipment available at bedside
- b. Observe neurologic status to determine progression of disease
- c. Prevent contractures and emboli by performing range-of-motion exercises

## Evaluation/Outcomes

1. Reports decreased bowel activity
2. Maintains fluid and electrolyte balance
3. Maintains nutritional status

## Syphilis

### Data Base

#### A Etiology and pathophysiology

1. Spirochete (*Treponema pallidum*) is sexually transmitted, usually during primary or secondary stages; prenatal transmission (congenital syphilis)
2. Stages
  - a. Primary: occurs 10 to 90 days after contact; clinical manifestations are localized to area of contact
  - b. Secondary: occurs up to 6 months after exposure; systemic response
  - c. Latent: begins after secondary stage; may last several months to years; asymptomatic
  - d. Tertiary: can occur 18 to 20 years later
    - (1) Gummas (granulomas) attack any organ and cause cardiovascular syphilis and neurosyphilis
    - (2) Transmission: rare, fetus can be infected

#### B Clinical findings

1. Primary syphilis
  - a. Chancre on genitalia, mouth, or anus; serous drainage from chancre
  - b. Enlarged lymph nodes
  - c. Tests for syphilis: Venereal Disease Research Laboratory (VDRL); rapid plasma reagin circle card test (RPR-CT); automated reagin test (ART); fluorescent treponemal antibody absorption test (FTA-ABS)
2. Secondary syphilis
  - a. Skin rash on palms and soles of feet, alopecia
  - b. Oral mucous membrane erosions
  - c. Fever, enlarged lymph nodes
3. Latent syphilis is asymptomatic
4. Tertiary syphilis
  - a. Cardiovascular changes (e.g., aortitis, aortic aneurysm, stroke)
  - b. Neurologic changes (e.g., personality changes, ataxia, blindness)

#### C Therapeutic interventions

1. Penicillin
  - a. One large dose for primary, secondary, and early latent stages
  - b. Large dose once every 7 days for 3 weeks for late latent stage
2. Probenecid to delay excretion of penicillin
3. Tetracycline or erythromycin if allergic to penicillin

## ***Nursing Care of Clients with Syphilis***

### **Assessment/Analysis**

1. Progression of clinical manifestations
2. Genitalia, rectum, and oropharynx for inflammation, lesions, or drainage
3. Regional lymph nodes for enlargement

### **Planning/Implementation**

1. Provide supportive, nonjudgmental environment
2. Encourage early screening and educational programs (e.g., sexually transmitted infection (STI) clinics, hot lines, workshops)
3. Teach about disease and its transmission: cleansing of genitals; condom use helps prevent transmission of most STIs
4. Encourage identification of sexual contacts so they can be treated
5. Inform that disease must be reported to health department but that confidentiality will be maintained
6. Determine if allergic to penicillin; explain need to complete course of antibiotic therapy
7. Instruct to avoid sexual activity until tests are negative; encourage monogamous relationship
8. Implement contact precautions
9. Teach meticulous hand hygiene to prevent autoinoculation

### **Evaluation/Outcomes**

1. Provides names of contacts
2. Avoids sexual contact until follow-up testing indicates transmission will not occur
3. Identifies “safer sex” practices

## **Gonorrhea**

### ***Data Base***

A Etiology and pathophysiology

1. Gram-negative diplococcus (*Neisseria gonorrhoeae*) is sexually transmitted; penicillinase-producing *N. gonorrhoeae* is a newer strain resistant to penicillin
2. Clinical findings depend on type of sexual contact; may be asymptomatic, or clinical manifestations may appear within a few days after exposure

3. Inflammation subsides in 2 to 4 weeks when untreated, but may precipitate a carrier state

#### B Clinical findings

1. Subjective: dysuria, urgency, anal pruritus, lower abdominal discomfort, joint pain, painful defecation
2. Objective
  - a. Purulent penile or vaginal discharge
  - b. Fever
  - c. Urethral or endocervical smear positive for gonococcus; cultures obtained from urethra, endocervix, anal canal, and pharynx
  - d. Complications if untreated (e.g., salpingitis, infertility, urethral stricture, prostatitis, epididymitis, inflammation of rectum and pharynx)

#### C Therapeutic intervention

1. Centers for Disease Control and Prevention (CDC) recommends ceftriaxone (Rocephin), or cefixime (Suprax)
2. Treatment for chlamydia (e.g., azithromycin [Zithromax]) if chlamydial infection is not ruled out

### ***Nursing Care of Clients with Gonorrhea***

#### **Assessment/Analysis**

1. See [Assessment/Analysis](#) under Nursing Care of Clients with Syphilis

#### **Planning/Implementation**

1. Teach meticulous hand hygiene to prevent conjunctivitis
2. Arrange for follow-up culture 2 weeks after therapy is instituted
3. Monitor urinary and bowel elimination
4. Allow time to verbalize concerns about potential infertility
5. Identify sexual contacts; encourage use of condoms to help prevent future infections
6. See [Nursing Care of Clients with Syphilis](#) for additional information

#### **Evaluation/Outcomes**

1. Avoids sexual contact until no longer communicable
2. Identifies “safer sex” practices
3. Maintains reproductive functions

## **Chlamydia**

### ***Data Base***

#### A Etiology and pathophysiology

1. Intracellular bacteria (*Chlamydia trachomatis*) is sexually transmitted; invades reproductive tract

2. More common in women; precursor of pelvic inflammatory disease (PID); usually asymptomatic in women; incidence in men is increasing
3. Incubation period from 1 to 3 weeks; may be asymptomatic for several months

#### B Clinical findings

1. Subjective: history of risk factors (e.g., previous sexually transmitted infection, multiple sex partners, lack of condom use, same-sex partners), dysuria, pelvic pain
2. Objective: vaginal/urethral discharge; urethritis (e.g., urinary frequency, mucoid discharge), cervicitis, salpingitis, positive tissue culture from reproductive tract
3. Complications (if untreated): epididymitis, prostatitis, infertility, Reiter syndrome (connective tissue disorder), PID, ectopic pregnancy

#### C Therapeutic interventions

1. Anti-infectives: azithromycin (Zithromax); doxycycline (Adoxa)
2. Treat sexual contacts

## ***Nursing Care of Clients with Chlamydia***

### **Assessment/Analysis**

1. Clinical manifestation of infection and complications
2. History of multiple sex partners, unsafe sex practices

### **Planning/Implementation**

1. Reinforce importance of continuing medication regimen
2. Teach to abstain from sexual intercourse until treatment is completed (usually 7 days after its institution)
3. Discuss lifestyle and its relation to risk factors
4. Explain that chlamydia is an STI that is reportable to the health department; encourage to report all sexual contacts
5. Teach women to be tested in 3 to 12 months because of risk for PID, to seek care if clinical manifestations return

### **Evaluation/Outcomes**

1. Seeks follow-up care
2. Reports sexual contacts to appropriate agency
3. Reports efforts to decrease risk factors by lifestyle changes

## **Herpes Genitalis**

### ***Data Base***

#### A Etiology and pathophysiology

1. Commonly caused by herpes simplex type 2 (herpesvirus hominis type 2); may be caused by type 1, which is most often associated with mouth lesions ("cold sores")
2. Lesions occur 3 to 7 days after infection and may last several weeks

3. Once resolved, virus lies dormant in spinal root ganglia and is capable of repeatedly causing lesions; stress may precipitate recurrence
4. Transmitted through sexual contact when active lesions are present; newborn may be infected during vaginal birth; therefore, cesarean birth is advocated when infections is active (i.e., lesions are visible)
5. May cause aseptic meningitis, proctitis, and prostatitis; associated with higher rate of cervical cancer

#### B Clinical findings

1. Subjective: dysuria, flulike clinical findings, tingling sensation before vesicles appear, genital itching and pain
2. Objective: leukorrhea, vaginal bleeding, vesicles and papules on genitalia ([Figure 13-1](#): Herpes simplex virus type 2), urinary retention, culture reveals herpesvirus type 2

**FIGURE 13-1** Herpes simplex virus type 2, in male (**A**) and female (**B**) clients. (From Habib TP: *Clinical dermatology: a color guide to diagnosis and therapy*, ed 5, St. Louis, 2009, Mosby.)

## C Therapeutic interventions

1. No cure
2. Antivirals: acyclovir (Zovirax), valacyclovir (Valtrex), or famciclovir (Famvir), penciclovir (Denavir) reduce healing time and severity of clinical manifestations
3. Sedation for severe pain
4. Alcohol (topical) may be used to dry lesions

## ***Nursing Care of Clients with Herpes Genitalis***

### **Assessment/Analysis**

1. See [Assessment/Analysis](#) under Nursing Care of Clients with Syphilis

### **Planning/Implementation**

1. Provide emotional support to cope with incurable, contagious nature of disease
2. Implement contact precautions
3. Explain medication regimen
4. Teach client
  - a. Keep area clean and dry; wear cotton underwear and loose-fitting clothing
  - b. Relieve local discomfort as prescribed (e.g., analgesics, topical anesthetic agents, sitz baths, application of heat or cold)
  - c. Prevent autoinoculation (e.g., avoid touching area unnecessarily, perform meticulous hand hygiene)
  - d. Increase fluid intake
  - e. Avoid sexual contact when lesions exist to prevent transmission
  - f. Avoid intercourse during last 6 weeks of pregnancy
  - g. Engage in “safer” sex practices
  - h. Have annual Pap smear test (females)
  - i. Use stress-reducing strategies
5. See [Planning/Implementation](#) under Nursing Care of Clients with Syphilis

### **Evaluation/Outcomes**

1. Reports relief of dysuria and pain
2. Exhibits intact skin without lesions
3. Abstains from sexual contact when lesions are present

## **Acquired Immunodeficiency Syndrome (AIDS)**

### ***Data Base***

#### A Etiology and pathophysiology

1. Caused by human immunodeficiency virus (HIV), a retrovirus; most commonly caused by HIV-1; other strains include HIV-2 and HIV-3
2. HIV infects helper T lymphocytes (T4/CD4 cells), B lymphocytes, macrophages,

promyelocytes, fibroblasts, and epidermal Langerhans cells

3. When T4/CD4 cell count falls below 200/ $\mu$ L opportunistic infections occur because of severely depressed immune system
4. Opportunistic infections and disorders associated with AIDS
  - a. Protozoal: *Pneumocystis jiroveci* pneumonia, toxoplasmosis, cryptosporidiosis
  - b. Fungal: candidiasis, cryptococcosis, histoplasmosis, tinea
  - c. Bacterial: *Mycobacterium avium-intracellulare* complex, *Mycobacterium tuberculosis* (MTB)
  - d. Viral: herpes simplex, varicella-zoster, cytomegalovirus, molluscum contagiosum, human papillomavirus, Epstein-Barr
  - e. Malignant: Kaposi sarcoma, B-cell lymphomas, non-Hodgkin lymphoma
5. Classification system for HIV infection according to CDC
  - a. T4/CD4 categories; each CD4 category has an A, B, or C clinical category, as is indicated in b.
    - (1) Category 1: 500 cells/ $\mu$ L or more
    - (2) Category 2: 200 to 499 cells/ $\mu$ L
    - (3) Category 3: Less than 200 cells/ $\mu$ L
  - b. Clinical categories
    - (1) Category A: categories B and C have not occurred; asymptomatic HIV infection; persistent generalized lymphadenopathy; acute (primary) HIV infection
    - (2) Category B: category C has not occurred; conditions attributed to HIV infection; conditions that are complicated by HIV infection (e.g., oral candidiasis, pelvic inflammatory disease, oral hairy leukoplakia, idiopathic thrombocytopenia purpura, herpes zoster, peripheral neuropathy)
    - (3) Category C: includes all clinical conditions listed as advanced HIV disease or AIDS; once classified in category C, person remains in this category (e.g., recurrent bacterial pneumonia; candidiasis of esophagus, bronchi, trachea, lungs; cytomegalovirus disease; encephalopathy; Kaposi sarcoma; pulmonary or extrapulmonary tuberculosis; *Pneumocystis jiroveci* infection; wasting syndrome)
6. Classification according to World Health Organization
  - a. Categories 1 through 4 progress from primary HIV infection to advanced HIV/AIDS.
  - b. CD4 cell counts not included; testing may be unavailable or too costly in some environments
7. HIV present in body fluids (e.g., blood, semen, vaginal secretions, blood-tinged saliva, tears, breast milk, and cerebrospinal fluid); transmission occurs through contact with infected body fluids; virus not viable outside body
8. HIV positive confirmation: blood tests reveal HIV or antibodies to HIV
9. HIV is transmitted to others by HIV positive persons
10. Incubation period
  - a. Ranges from 6 months to 10 years or longer

- b. Antibodies first detected in blood 2 weeks to 3 months or longer after infection; test detects virus within 24 hours of exposure

## B Clinical findings

1. Subjective: anorexia, fatigue, dyspnea, chills, sore throat

2. Objective

- a. Positive test result for HIV antibodies: ELISA (enzyme-linked immunosorbent assay) for screening; Western blot used to confirm positive ELISA result
- b. Positive test result for HIV; polymerase chain reaction (PCR); HIV RNA provides evidence of viral load
- c. Decreased T4/CD4 cells to less than 200/ $\mu$ L
- d. Decreased ratio of T4 cell (helper cell) to T8 cell (suppressor cell)
- e. Night sweats
- f. Enlarged lymph nodes
- g. Wasting syndrome: weight loss exceeding 10% baseline weight, chronic diarrhea for more than 30 days, chronic weakness, constant fever
- h. HIV encephalopathy: memory loss, lack of coordination, partial paralysis, mental deterioration
- i. Presence of associated opportunistic infections and malignancies

## C Therapeutic interventions

1. No cure; considered chronic illness; goal is prevention

2. Pharmacologic therapy: highly active antiretroviral therapy (HAART) involves drug combinations; combinations and order in which they are given influence effectiveness. Three or more drugs from at least 2 different classes fight HIV at different stages of its replication. More than 30 drugs are approved by the FDA for HIV treatment.

a. Nucleoside analogue reverse transcriptase inhibitors (NRTIs)

(1) Interfere with DNA chain

(2) Examples: lamivudine (Epivir), emtricitabine (Emtriva), abacavir (Ziagen), zidovudine (Retrovir)

(3) Side effects: lactic acidosis, hepatomegaly, peripheral neuropathy, rash

b. Protease inhibitors (PIs)

(1) Disables protease, the protein that HIV needs to reproduce

(2) Examples: tipranavir (Aptivus), ritonavir (Norvir), indinavir (Crixivan), nelfinavir (Viracept), fosamprenavir (Lexiva), atazanavir (Reyataz), saquinavir (Invirase), lopinavir/ritonavir (Kaletra), darunavir (Prezista)

(3) Side effects: nausea, vomiting, diarrhea, abdominal pain, and anorexia (GI irritation); hyperglycemia (diabetes); peripheral paresthesias (neuropathy); headache (dehydration); renal calculi (calcium precipitation); increased liver enzymes (hepatotoxicity)

c. Nonnucleoside reverse transcriptase inhibitors (NNRTIs)

(1) Bind to reverse transcriptase and block RNA and DNA replication

(2) Examples: nevirapine (Viramune), etravirine (Intelence), efavirenz (Sustiva), delavirdine (Rescriptor)

(3) Side effects: transient rash, nausea, diarrhea; hepatotoxicity, nephrotoxicity

d. Fusion inhibitor

- (1) Stops HIV from entering CD4 cells by inhibiting fusion of viral and cellular membranes
- (2) Examples: maraviroc (Selzentry), enfuvirtide (Fuzeon)
- (3) Side effects: painful skin reactions at local injection site, headache, peripheral neuropathy, hypersensitivity reactions, and pneumonia

e. Integrase inhibitors

- (1) Interfere with integrase enzyme, which HIV needs to insert its genes into CD4 cells' genes
- (2) Example: raltegravir (Isentress)

f. Antiviral

- (1) Decrease HIV levels in blood and genital secretions; also used for herpes zoster and genital herpes
- (2) Example: valacyclovir (Valtrex)

g. Four combinations of drugs are preferred regimens for treatment of naive clients

- (1) Raltegravir + tenofovir/emtricitabine
- (2) Efavirenz/tenofovir/emtricitabine
- (3) Ritonavir-boosted atazanavir plus tenofovir/emtricitabine
- (4) Ritonavir-boosted darunavir plus tenofovir/emtricitabine

3. Specific medications to treat opportunistic infections

- a. *P. jiroveci*: trimethoprim-sulfamethoxazole (Bactrim), pentamidine (Pentam)
- b. Tuberculosis: isoniazid (INH); rifampin (Rifadin); ethambutol (Myambutol)
- c. Fungal infections: nystatin (Mycostatin), amphotericin B (Fungizone), ketoconazole (Nizoral)
- d. Viral infections: acyclovir (Zovirax)

4. Management of clinical manifestations

5. Postexposure prophylaxis (PEP) for accidental needle sticks: treatment with reverse transcriptase inhibitors

6. HIV counseling: referral to CDC for counseling, testing, and referral standards (CTR); guidelines developed using evidence-based approach by U.S. Preventive Services Task Force and public health practice guidelines

7. Research to control disease: genetic manipulation and vaccines to prevent HIV infection in uninfected individuals; new drugs now in clinical trials

## ***Nursing Care of Clients with Acquired Immunodeficiency Syndrome***

### **Assessment/Analysis**

1. Screen for HIV per CDC recommendations

- a. All people 13 to 64 years of age regardless of risk; clients residing in all health-care settings; persons at risk annually; pregnant women at first visit and repeat screening in third trimester
- b. Separate consent not required, but notification is necessary and screening can be declined

2. Weight and vital signs for baseline
3. Progression of clinical manifestations
4. Lymph nodes for lymphadenopathy
5. Skin and mucous membranes for evidence of Kaposi sarcoma (e.g., lesions in epidermis that extend into dermis, extracutaneous lesions); opportunistic infections
6. Respiratory function (e.g., characteristics of respiration, arterial blood gases, breath sounds)

## Planning/Implementation

1. Use standard precautions for all clients, regardless of diagnosis, because virus can be transmitted before exhibiting evidence of disease
2. Encourage verbalization of feelings; provide emotional support
3. Refer client and significant others to counselor or support group because they are coping with a chronic illness and may have to cope with social pressures
4. Protect from secondary infection; assess for clinical manifestations of opportunistic infections
5. Provide care related to specific drugs
  - a. Zidovudine: monitor for blood dyscrasias
  - b. Protease inhibitor: teach to avoid drinking alcohol (hepatotoxicity); to drink 8 to 10 glasses of water per day to avoid dehydration
  - c. Ritonavir (Norvir) and saquinavir (Fortovase): teach to take with high-fat, high-protein meal
  - d. Indinavir (Crixivan): teach to take on empty stomach
6. Provide frequent rest periods
7. Teach client
  - a. Adhere to prescribed medication dosage regimen; nonadherence has led to emergence of resistant strains
  - b. Inform sexual contacts of diagnosis
  - c. Avoid sexual intercourse/activity unless using condom; avoid use of petroleum jelly because it interferes with condom integrity
  - d. Avoid sharing needles with other individuals
  - e. Continue health care supervision
  - f. Prevent opportunistic infections (e.g., avoid crowds, meticulous hand hygiene)
  - g. Avoid breastfeeding
  - h. Avoid undercooked meats
  - i. Avoid small animals in the home to reduce risk of opportunistic infections (e.g., protozoan, viral)
8. Encourage intake of high-calorie, high-protein diet to prevent weight loss; encourage intake of foods rich in immune-stimulating nutrients (e.g., vitamins A, C, and E, and selenium) to support natural defense mechanisms; encourage six smaller meals a day

## Evaluation/Outcomes

1. Maintains body weight
2. Completes self-care activities without fatigue
3. Maintains skin integrity
4. Avoids opportunistic infections
5. Shares feelings with family and health care providers
6. States knowledge of community support groups

## West Nile Virus (WNV)

### **Data Base**

#### A Etiology and pathophysiology

1. Virus (Flavivirus) enters body through mosquito bite; mosquito contracts virus from infected birds (main host); also transmitted via infected blood products and organs
2. Twenty percent experience mild episode resulting in West Nile fever; some experience severe episode, with 1 in 150 developing encephalitis or meningitis; most people do not seek treatment
3. Incubation period is 3 to 14 days; clinical manifestations last 3 to 6 days
4. Older adults, infants, and immunocompromised individuals are at greatest risk

#### B Clinical findings

1. Subjective
  - a. Mild episode: anorexia, eye pain, headache, malaise, myalgia, nausea
  - b. Severe episode: same as mild episode plus weakness and fatigue
2. Objective
  - a. Mild episode: vomiting, lymphadenopathy, rash on neck, trunk, arms, or legs, IgM antibody to WNV in serum or cerebrospinal fluid
  - b. Severe episode: same as mild episode plus change in mental status, flaccid paralysis, and confusion; 1 in 150 develop encephalitis or meningitis; some progress to coma and death

#### C Therapeutic interventions

1. No specific treatment for WNV
2. Supportive care
  - a. Mild episode: increase fluid intake and rest
  - b. Severe episode: IV fluids; respiratory support if necessary; prevention of secondary infection; medications for fever, discomfort, and treatment of encephalitis or meningitis if present (e.g., corticosteroids for cerebral edema, anticonvulsants and acyclovir if herpes simplex virus cannot be excluded as cause of encephalitis)
3. Prevention: eliminate or avoid stagnant pools of water to limit mosquito population

### **Nursing Care of Clients with West Nile Virus**

### **Assessment/Analysis**

1. Exposure to causative agent
2. Differentiate between minor or severe episode

## **Planning/Implementation**

1. Provide supportive care (e.g., encourage rest, increase in fluid intake)
2. Administer prescribed medications for fever, discomfort, and encephalitis or meningitis
3. Teach how to prevent mosquito bites (e.g., use repellents; avoid outdoors during dusk and dawn; wear light long-sleeve shirts, pants, and socks; secure screens; cover infants with netting when outdoors; prevent or clean areas that contain stagnant water)

## **Evaluation/Outcomes**

1. Maintains fluid and electrolyte balance
2. Reports relief of fatigue and fever
3. Implements strategies to prevent mosquito bites

## **Severe Acute Respiratory Syndrome (SARS)**

See [Chapter 7](#), Nursing Care of Clients with Respiratory System Disorders, Pneumonia

## Review Questions with Answers and Rationales

### Questions

---

**Note:** Thousands of additional practice questions are available on the enclosed companion CD.

▶ Denotes alternate format question.

# Growth and Development

1. When planning discharge teaching for a young adult, the nurse should include the potential health problems common in this age group. What should the nurse include in this teaching plan?
  1. Kidney dysfunction
  2. Cardiovascular diseases
  3. Eye problems, such as glaucoma
  4. Accidents, including their prevention
2. What principle of teaching specific to an older adult should the nurse consider when providing instruction to such a client recently diagnosed with diabetes mellitus?
  1. Knowledge reduces general anxiety.
  2. Capacity to learn decreases with age.
  3. Continued reinforcement is advantageous.
  4. Readiness of the learner precedes instruction.
3. A 76-year-old male client asks the nurse about the chances of getting osteoporosis like his wife. Which is the **best** response by the nurse?
  1. "This is only a problem for women."
  2. "Exercise is a good way to prevent this problem."
  3. "You are not at risk because of your small frame."
  4. "You might think about having a bone density test."
4. What is the **priority** when working with a group of middle-aged adult clients?
  1. Cessation of smoking
  2. Prevention of infection
  3. Abstinence from alcohol
  4. Decreasing high-density lipoproteins levels
5. Which factor does the nurse consider **most** likely contributes to the increased incidence of hip fractures in older adults?
  1. Carelessness
  2. Fragility of bone
  3. Sedentary existence
  4. Rheumatoid diseases
6. Which age-related change should the nurse consider when formulating a plan of care for an older adult? **Select all that apply.**
  1. Difficulty in swallowing
  2. Increased sensitivity to heat
  3. Increased sensitivity to glare
  4. Diminished sensation of pain
  5. Heightened response to stimuli
7. A nurse is caring for an older adult with a hearing loss secondary to aging. What can the nurse expect to identify when assessing this client? **Select all that apply.**
  1. Dry cerumen
  2. Tears in the tympanic membrane

3. Difficulty hearing women's voices
4. Decrease of hair in the auditory canal
5. Overgrowth of the epithelial auditory lining
8. A 93-year-old client in a nursing home has been eating less food during mealtimes.

What is the **priority** nursing intervention?

1. Substitute a supplemental drink for the meal.
  2. Spoon-feed the client until the food is completely eaten.
  3. Allow the client a longer period of time to complete the meal.
  4. Arrange a consultation for the placement of a gastrostomy tube.
9. A 78-year-old client who has hypertension is beginning treatment with furosemide (Lasix). Considering the client's age, what should the nurse teach the client to do?
1. Limit fluids at bedtime.
  2. Change positions slowly.
  3. Take the medication between meals.
  4. Assess the skin for breakdown daily.

# Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

►10. A nurse must obtain a client's apical pulse. Place an X over the site where the nurse should place the stethoscope.

11. Which client statement indicates an understanding of the nurse's instructions concerning a Holter monitor?

1. "The only times the monitor should be taken off is for showering and sleep."
2. "The monitor will record my activities and symptoms if an abnormal rhythm occurs."
3. "The results from the monitor will be used to determine the size and shape of my heart."
4. "The monitor will record any abnormal heart rhythms while I go about my usual activities."

12. A client with a history of dysrhythmias is to wear a Holter monitor for 24 hours on an outpatient basis. What should the nurse teach the client to do while wearing the monitor?

1. Discontinue medications.
2. Avoid using a microwave oven.
3. Keep a written account of activities.
4. Record the blood pressure periodically.

13. A client with a dysrhythmia is admitted to telemetry for observation. In the morning the client asks for a cup of coffee. What is the nurse's **best** response?

1. "Hot drinks such as coffee are not good for your heart."
2. "Coffee is not permitted on the diet that was ordered for you."
3. "You cannot have coffee. I can bring you a cup of tea if you like."
4. "Coffee has caffeine that can affect your heart. It should be avoided."

14. A client who had several episodes of chest pain is scheduled for an exercise electrocardiogram. Which explanation should the nurse include when teaching the client about this procedure?

1. "This is a noninvasive test to check your heart's response to physical activity."

2. "This test is the definitive method to identify the actual cause of your chest pain."
  3. "The findings of this test will be of minimal assistance in the treatment of angina."
  4. "The findings from this minimally invasive test will show how your body reacts to exercise."
15. A client is admitted with chest pain unrelieved by nitroglycerin, an elevated temperature, decreased blood pressure, and diaphoresis. A myocardial infarction is diagnosed. Which should the nurse consider as a valid reason for one of this client's physiologic responses?
1. Parasympathetic reflexes from the infarcted myocardium cause diaphoresis.
  2. Inflammation in the myocardium causes a rise in the systemic body temperature.
  3. Catecholamines released at the site of the infarction cause intermittent localized pain.
  4. Constriction of central and peripheral blood vessels causes a decrease in blood pressure.
16. What must the nurse do to determine a client's pulse pressure?
1. Multiply the heart rate by the stroke volume.
  2. Subtract the diastolic from the systolic reading.
  3. Determine the mean blood pressure by averaging the two.
  4. Calculate the difference between the apical and radial rate.
17. After surgery for insertion of a coronary artery bypass graft (CABG), a client develops a temperature of 102° F (38.8° C). What **priority** concern related to elevated temperatures does a nurse consider when notifying the health care provider about the client's temperature?
1. A fever may lead to diaphoresis.
  2. A fever increases the cardiac output.
  3. An increased temperature indicates cerebral edema.
  4. An increased temperature may be a sign of hemorrhage.
18. A nurse is teaching a group of clients with peripheral vascular disease about a smoking cessation program. Which physiologic effect of nicotine should the nurse explain to the group?
1. Constriction of the superficial vessels dilates the deep vessels.
  2. Constriction of the peripheral vessels increases the force of flow.
  3. Dilation of the superficial vessels causes constriction of collateral circulation.
  4. Dilation of the peripheral vessels causes reflex constriction of visceral vessels.
19. During an interview, the nurse discovers that the spouse of a debilitated, chronically constipated client digitally removes stool from the client's rectum. What response to disimpaction is the nurse attempting to prevent by presenting other strategies to regulate the client's bowel movements?
1. Increased pulse rate
  2. Slowing of the heart
  3. Dilation of the bronchioles
  4. Coronary artery vasodilation
20. A nurse is assessing the legs of a client with a history of chronic venous insufficiency. What physiologic changes should the nurse conclude are the result of this disease

process? **Select all that apply.**

1. Stasis ulcer
2. Necrotic tissue
3. Ecchymotic areas
4. Diminished pulses
5. Brown discoloration

21. A nurse is caring for a client with chronic occlusive arterial disease. What precipitating cause is the nurse **most** likely to identify for the development of ulceration and gangrenous lesions?

1. Emotional stress, which is short-lived
2. Poor hygiene and limited protein intake
3. Stimulants such as coffee, tea, or cola drinks
4. Trauma from mechanical, chemical, or thermal sources

22. A client is prescribed prolonged bed rest after surgery. Which complication does the nurse expect to prevent by teaching this client to avoid pressure on the popliteal space?

1. Cerebral embolism
2. Pulmonary embolism
3. Dry gangrene of a limb
4. Coronary vessel occlusion

23. A nurse in the postanesthesia care unit is caring for a client who received a general anesthetic. Which finding should the nurse report to the health care provider?

1. Client pushes the airway out.
2. Client has snoring respirations.
3. Respirations of 16 breaths/min are shallow.
4. Systolic blood pressure drops from 130 to 90 mm Hg.

24. After abdominal surgery a client suddenly reports numbness in the right leg and a “funny feeling” in the toes. What should the nurse do **first**?

1. Elevate the legs and tell the client to drink more fluids.
2. Instruct the client to remain in bed and notify the health care provider.
3. Rub the client’s legs to stimulate circulation and cover the client with a blanket.
4. Tell the client about the dangers of prolonged bed rest and encourage ambulation.

25. After a bilateral lumbar sympathectomy a client has a sudden drop in blood pressure, but there is no evidence of bleeding. What should the nurse identify as the **most** likely cause of the change in blood pressure?

1. Inadequate fluid intake
2. Consequence of anesthesia
3. Increased level of epinephrine
4. Reallocation of the blood supply

26. A nurse inspects a two-day-old intravenous site and identifies erythema, warmth, and mild edema. The client reports tenderness when the area is palpated. What should the nurse do **first**?

1. Irrigate the IV tubing.
2. Discontinue the infusion.

3. Slow the rate of the infusion.
4. Obtain a prescription for an analgesic.
- ▶27. While convalescing from abdominal surgery a client develops thrombophlebitis. Which clinical indicators of this complication should the nurse expect to identify when assessing the client? **Select all that apply.**

1. Pain in the calf
2. Intermittent claudication
3. Redness in the affected area
4. Pitting edema of the lower leg
5. Ecchymotic areas around the ankle
6. Localized warmth in the lower extremity

28. A client who had surgery 24 hours ago reports pain in the calf. Assessment reveals redness and swelling at the site of discomfort. What should the nurse do?

1. Keep both legs dependent.
2. Notify the health care provider.
3. Apply a warm soak to the left calf.
4. Administer the prescribed analgesic.

▶29. A nurse is assessing arterial perfusion in a client who had surgery with placement of a graft for an aneurysm in the left femoral artery. Place an X over the site of the pulse that should be assessed to determine maximum arterial perfusion distal to the operative site.

30. A nurse is teaching a client about the use of antiembolism stockings. What instruction should the nurse include?

1. Keep the stockings on two hours and off two hours.
2. Wear the stockings only at bedtime when activity lessens.
3. Put the stockings on before getting out of bed in the morning.
4. Leave the stockings in place until the health care provider advises otherwise.

31. A health care provider orders thigh-high antiembolism stockings for a client with varicose veins. The client's thighs are heavier than the lower legs, and the stockings fit on the lower leg but are causing discomfort and indentations on the upper thighs. What should the nurse do?

1. Replace the thigh-high stockings with knee-high stockings.
2. Leave the antiembolism stockings off to prevent tissue damage.
3. Roll the top of the stockings to below the knees to limit popliteal pressure.
4. Ask the health care provider if an elastic bandage can be used in place of the stockings.

32. What should the nurse teach a client who is taking antihypertensives to do to minimize orthostatic hypotension?

1. Wear support hose continuously.
2. Lie down for 30 minutes after taking medication.
3. Avoid tasks that require high-energy expenditure.
4. Sit on the edge of the bed for 5 minutes before standing.

33. A client being treated for hypertension reports having a persistent hacking cough. What class of antihypertensive should the nurse identify as a possible cause of this response when reviewing a list of this client's medications?

1. ACE inhibitors
2. Thiazide diuretics
3. Calcium channel blockers
4. Angiotensin receptor blockers

34. What client response indicates to the nurse that a vasodilator medication is effective?

1. Pulse rate decreases from 110 to 75
2. Absence of adventitious breath sounds
3. Increase in the daily amount of urine produced
4. Blood pressure changes from 154/90 to 126/72

35. What should the nurse assess to determine if a client is experiencing the therapeutic effect of valsartan (Diovan)?

1. Lipid profile
2. Apical pulse
3. Urinary output
4. Blood pressure

36. What information should the nurse include when teaching a client with heart disease about cholesterol?

1. Can be found in both plant and animal sources
2. Causes an increase in serum high-density lipoprotein
3. Should be eliminated because it causes the disease process

4. Decreases when unsaturated fats are substituted for saturated fats

37. Which instructions should the nurse include in the teaching plan for a client with hyperlipidemia who is being discharged with a prescription for cholestyramine (Questran)?

1. "Increase your intake of fiber and fluid."
2. "Take the medication before you go to bed."
3. "Check your pulse before taking the medication."
4. "Contact your health care provider if your skin or sclera turn yellow."

38. A nurse is providing dietary instruction to a client with cardiovascular disease. Which dietary selection by the client indicates the need for further instruction?

1. Whole milk with oatmeal
2. Garden salad with olive oil
3. Tuna fish with a small apple
4. Soluble fiber cereal with skim milk

39. A nurse asks a client with ischemic heart disease to identify the foods that are **most** important to restrict. The nurse determines that the client understands the dietary instructions when the client identifies the following foods. **Select all that apply.**

1. Olive oil
2. Chicken broth
3. Enriched whole milk
4. Red meats, such as beef
5. Vegetables and whole grains
6. Liver and other glandular organ meats

40. Which instructions should the nurse include in the teaching plan for a client who will be taking simvastatin (Zocor) when discharged? **Select all that apply.**

1. Increase dietary intake of potassium.
2. Avoid prolonged exposure to the sun.
3. Schedule regular ophthalmic examinations.
4. Take the medication at least a half hour before meals.
5. Contact your health care provider if skin becomes gray-bronze.

41. Which topic should the nurse determine is **most** appropriate when presenting health-related instruction to clients from an African-American community?

1. Osteoporosis
2. Hypertension
3. Uterine cancer
4. Thyroid disorders

42. Amlodipine (Norvasc) is prescribed for a client with hypertension. Which response to the medication should the nurse instruct the client to report to the health care provider?

1. Blurred vision
2. Dizziness on rising
3. Excessive urination
4. Difficulty breathing

43. Atenolol (Tenormin) 150 mg by mouth is prescribed for a client with hypertension.

Each tablet contains 50 mg. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

44. What should the nurse identify as the **primary** cause of the pain experienced by a client with a coronary occlusion?

1. Arterial spasm
2. Heart muscle ischemia
3. Blocking of the coronary veins
4. Irritation of nerve endings in the cardiac plexus

45. What instructions about the use of nitroglycerin should the nurse provide to a client with angina?

1. "Identify when pain occurs, and place 2 tablets under the tongue."
2. "Place 1 tablet under the tongue, and swallow another when pain is intense."
3. "Before physical activity place 1 tablet under the tongue, and repeat the dose in 5 minutes if pain occurs."
4. "Place 1 tablet under the tongue when pain occurs, and use an additional tablet after the attack to prevent recurrence."

46. Which nursing action is **most** important when caring for a client after a cardiac catheterization?

1. Provide for rest.
2. Administer oxygen.
3. Check a pulse distal to the insertion site.
4. Assess the electrocardiogram every fifteen minutes.

47. For which common complication of myocardial infarction should the nurse monitor clients in the coronary care unit?

1. Dysrhythmia
2. Hypokalemia
3. Anaphylactic shock
4. Cardiac enlargement

48. A nurse prepares a client for insertion of a pulmonary artery catheter. What information can be obtained from monitoring the pulmonary artery pressure?

1. Stroke volume
2. Venous pressure
3. Coronary artery patency
4. Left ventricular functioning

49. A client with a thromboembolic disorder is receiving a continuous intravenous infusion of heparin 1000 units per hour. There are 25,000 units of heparin in 500 mL of 5% dextrose solution. At how many milliliters per hour should the nurse set the rate on the electronic infusion control device? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL/hr

50. An older adult with cerebral arteriosclerosis is admitted with atrial fibrillation and is started on a continuous heparin infusion. What clinical finding enables the nurse to conclude that the anticoagulant therapy is effective?

1. A reduction of confusion
  2. An APPT twice the usual value
  3. An absence of ecchymotic areas
  4. A decreased viscosity of the blood
51. What specifically should the nurse monitor when a client is receiving a platelet aggregation inhibitor such as clopidogrel (Plavix)?
1. Nausea
  2. Epistaxis
  3. Chest pain
  4. Elevated temperature
52. A client is receiving warfarin (Coumadin). Which test result should the nurse use to determine if the daily dose of this anticoagulant is therapeutic?
1. INR
  2. APTT
  3. Bleeding time
  4. Sedimentation rate
53. What should the nurse teach a client to expect when preparing for discharge after surgery for a coronary artery bypass graft?
1. Mild fever and extreme fatigue for several weeks after surgery
  2. Cessation of drainage from the incisions after hospitalization
  3. Mild incisional pain and tenderness up to three weeks after surgery
  4. Some edema in the leg used for the donor graft is expected with activity
54. A client with left ventricular heart failure is taking digoxin (Lanoxin) 0.25 mg daily. What changes does the nurse expect to find if this medication is therapeutically effective? **Select all that apply.**
1. Diuresis
  2. Tachycardia
  3. Decreased edema
  4. Decreased pulse rate
  5. Reduced heart murmur
  6. Jugular vein distention
55. A nurse identifies signs of electrolyte depletion in a client with heart failure who is receiving bumetanide (Bumex) and digoxin (Lanoxin). What does the nurse determine is the cause of the depletion?
1. Diuretic therapy
  2. Sodium restriction
  3. Continuous dyspnea
  4. Inadequate oral intake
56. A client is in cardiogenic shock. What explanation of cardiogenic shock should the nurse include when responding to a family member's questions about the condition?
1. An irreversible phenomenon
  2. A failure of the circulatory pump
  3. Usually a fleeting reaction to tissue injury

4. Generally caused by decreased blood volume

57. What clinical indicator is the nurse **most** likely to identify when completing a history and physical assessment of a client with complete heart block?

1. Syncope
2. Headache
3. Tachycardia
4. Hemiparesis

58. A nurse in the emergency department is assigned to care for four clients with serious health problems. Which health problem should the nurse identify as the **priority**?

1. Head injury
2. Fractured femur
3. Ventricular fibrillation
4. Penetrating abdominal wound

59. While a pacemaker catheter is being inserted, the client's heart rate drops to 38 beats/min. What medication should the nurse expect the health care provider to prescribe?

1. Digoxin (Lanoxin)
2. Lidocaine (Xylocaine)
3. Amiodarone (Cordarone)
4. Atropine sulfate (Atropine)

60. A client with a bundle branch block is on a cardiac monitor. What ECG change should the nurse identify on the client's cardiac monitor?

1. Sagging ST segments
2. Absence of P wave configurations
3. Inverted T waves following each QRS complex
4. Widening of QRS complexes to a minimum of 0.12 second

61. A nurse observes the cardiac monitor of a client who has had a pacemaker inserted. Place an X on the rhythm strip where there is evidence of pacemaker function.

62. A nurse observes the following dysrhythmia on a client's cardiac monitor. What rhythm does the nurse identify?

1. Atrial flutter
  2. Atrial fibrillation
  3. Ventricular fibrillation
  4. Ventricular tachycardia
63. In addition to atrial fibrillation, what ventricular rhythm exhibited by a client does the nurse determine may be converted to a sinus rhythm by cardioversion?
1. Standstill
  2. Fibrillation
  3. Tachycardia with a pulse
  4. Frequent premature complexes
64. What nursing action should be included in the plan of care for a client who had a permanent fixed (asynchronous) pacemaker inserted?
1. Instruct the client that it is better to sleep on two pillows.
  2. Encourage the client to reduce activity from former levels.
  3. Teach the client to keep daily accurate records of the pulse.
  4. Inform the client that the pacemaker functions when the heart rate drops below a preset rate.
65. What assessment of the pulse should the nurse identify when a client's on-demand pacemaker is functioning effectively?
1. Regular rhythm
  2. Palpable at all pulse sites
  3. At least at the demand rate
  4. Equal to the pacemaker setting
66. A client is receiving continuous ECG monitoring while intravenous medication is being administered for premature ventricular complexes (PVC). What dysrhythmia does the nurse conclude that the client is experiencing when the following rhythm appears on the ECG monitor?
1. Atrial flutter
  2. Atrial fibrillation
  3. Ventricular fibrillation
  4. Ventricular tachycardia

67. When a client develops ventricular fibrillation in a coronary care unit, what is the responsibility of the first person reaching the client?

1. Administer oxygen.
2. Initiate defibrillation.
3. Initiate cardiopulmonary resuscitation.
4. Administer sodium bicarbonate intravenously.

68. A client who had a myocardial infarction is in the coronary care unit on a cardiac monitor. The nurse observes ventricular irritability on the screen. What medication should the nurse prepare to administer?

1. Digoxin (Lanoxin)
2. Furosemide (Lasix)
3. Amiodarone (Cordarone)
4. Norepinephrine (Levophed)

69. A client is admitted to the coronary care unit with atrial fibrillation and a rapid ventricular response. The nurse prepares for cardioversion. What nursing action is **essential** to avoid the potential danger of inducing ventricular fibrillation during cardioversion?

1. Energy level is set at its maximum level.
2. Synchronizer switch is in the "on" position.
3. Skin electrodes are applied after the T wave.
4. Alarm system of the cardiac monitor is functioning simultaneously.

70. For which client should the nurse conclude that a prescription for digoxin (Lanoxin) is appropriate?

1. Client A

2. Client B

3. Client C

#### 4. Client D

71. What is the **most** important information the nurse and the rapid response team must keep in mind when caring for a client who had a cardiac arrest?

1. Age of the client
2. How long the client was anoxic
3. Heart rate of the client before the arrest
4. Emergency medications available for the client

72. A client is found unconscious and unresponsive. What should the nurse do **first**?

1. Initiate a code.
2. Check for a radial pulse.
3. Compress the lower sternum.
4. Give four full lung inflations.

73. A nurse is performing cardiac compression on an adult client. How far must the nurse depress the lower sternum to maintain circulation until a defibrillator is available?

1.  $\frac{3}{4}$  to 1 inch
2.  $\frac{1}{2}$  to  $\frac{3}{4}$  inch
3. 1 to  $1\frac{1}{2}$  inches
4. 2 to  $2\frac{1}{2}$  inches

74. A nurse is performing external cardiac compression. How should the nurse exert downward vertical pressure?

1. Extending the fingers over the sternum and chest with the heels of each hand side by side
2. Placing the fingers of one hand on the sternum and the fingers of the other hand on top of them
3. Interlocking the fingers with the heel of one hand on the sternum and the heel of the other on top of it
4. Clenching the hand into a fist and placing the fleshy part of a clenched fist on the lower sternum

75. A client has edema in the lower extremities during the day, which disappears at night. With which medical problem does the nurse conclude this clinical finding is consistent?

1. Pulmonary edema
  2. Myocardial infarction
  3. Right ventricular heart failure
  4. Chronic obstructive lung disease
76. A client admitted to the hospital has edematous ankles. What should the nurse do to **best** reduce edema of the lower extremities?
1. Restrict fluids.
  2. Elevate the legs.
  3. Apply elastic bandages.
  4. Do range-of-motion exercises.
77. What clinical indicators is the nurse **most** likely to identify when taking the admission history of a client with right ventricular failure? **Select all that apply.**
1. Edema
  2. Vertigo
  3. Polyuria
  4. Dyspnea
  5. Palpitations
78. What change in pressure does the nurse conclude is responsible for the lower extremity pitting edema of a client with right ventricular heart failure?
1. Increase in plasma hydrostatic pressure
  2. Increase in tissue colloid osmotic pressure
  3. Decrease in the tissue hydrostatic pressure
  4. Decrease in the plasma colloid osmotic pressure
79. The family of a client with right ventricular heart failure expresses concern about the client's increasing abdominal girth. What physiologic change should the nurse consider when explaining the client's condition?
1. Loss of cellular constituents in blood
  2. Rapid osmosis from tissue spaces to cells
  3. Increased pressure within the circulatory system
  4. Rapid diffusion of solutes and solvents into plasma
80. What dietary choices should the nurse instruct the client taking spironolactone (Aldactone) to avoid? **Select all that apply.**
1. Potatoes
  2. Red meat
  3. Cantaloupe
  4. Wheat bread
  5. Flavored yogurt
81. A nurse is advising a client about the risks associated with failing to seek treatment for acute pharyngitis caused by beta-hemolytic streptococcus. For what health problem is the client at risk?
1. Asthma
  2. Anemia
  3. Endocarditis

4. Reye syndrome

82. What effect of anxiety makes it particularly important for the nurse to allay the anxiety of a client with heart failure?

1. Increases the cardiac workload
2. Interferes with usual respirations
3. Produces an elevation in temperature
4. Decreases the amount of oxygen used

83. What should the nurse do to help alleviate the distress of a client with heart failure and pulmonary edema?

1. Encourage frequent coughing.
2. Elevate the client's lower extremities.
3. Prepare for modified postural drainage.
4. Place the client in the orthopneic position.

84. A nurse is providing discharge instructions to a client who experienced an anterior septal myocardial infarction. What statement by the client indicates to the nurse that there is a need for further teaching?

1. "I want to stay as pain-free as possible."
2. "I am not good at remembering to take medications."
3. "I should not have any problems in reducing my salt intake."
4. "I wrote down my medication information for future reference."

85. Two hours after a cardiac catheterization that was accessed via the right femoral route, an adult client complains of numbness and pain in the right foot. What action should the nurse take **first**?

1. Call the health care provider.
2. Check the client's pedal pulses.
3. Take the client's blood pressure.
4. Recognize the response is expected.

86. A client is returned to the surgical unit immediately after placement of a coronary artery stent that was accomplished via access through the femoral artery. What response should the nurse consider the **priority** when assessing this client?

1. Acute pain
2. Impaired mobility
3. Impaired swallowing
4. Hematoma formation

87. A client is admitted with the diagnosis of possible myocardial infarction, and a series of diagnostic tests is ordered. Which blood level should the nurse expect will increase **first** if this client has had a myocardial infarction?

1. ALT
2. AST
3. Total LDH
4. Troponin T

88. When an older client with heart failure is transferred from the emergency department to the medical service, what should the nurse on the unit do **first**?

1. Interview the client for a health history.
  2. Assess the client's heart and lung sounds.
  3. Monitor the client's pulse and temperature.
  4. Obtain the client's blood specimen for electrolytes.
89. A client has contrast medium injected into the brachial artery so that a cerebral angiogram can be performed. What nursing assessment is **most** essential immediately after the procedure?
1. Stability of gait
  2. Presence of a gag reflex
  3. Blood pressure in both arms
  4. Symmetry of the radial pulses
90. A nurse is leading a discussion in a senior citizen center about the risk factors for developing coronary heart disease (CHD) for women versus men. What should the nurse respond when asked to identify the **most** significant risk factor?
1. Obesity
  2. Diabetes
  3. Elevated CRP levels
  4. High levels of HDL-C
91. A nurse is teaching a group of clients about risk factors for heart disease. Which factors increase a client's risk for a myocardial infarction? **Select all that apply.**
1. Obesity
  2. Hypertension
  3. Increased HDL
  4. Diabetes insipidus
  5. Asian-American ancestry
92. What is the **most** important nursing action when measuring a client's pulmonary capillary wedge pressure (PCWP)?
1. Deflate the balloon as soon as the PCWP is measured.
  2. Have the client bear down when measuring the PCWP.
  3. Place the client in a supine position before measuring the PCWP.
  4. Flush the catheter with a heparin solution after the PCWP is determined.
93. What criteria should the nurse use to determine normal sinus rhythm for a client on a cardiac monitor? **Select all that apply.**
1. The RR intervals are relatively consistent.
  2. One P wave precedes each QRS complex.
  3. The ST segment is higher than the PR interval.
  4. Four to eight complexes occur in a 6-second strip.
  5. The QRS complex ranges from 0.12 to 0.2 seconds.
94. What is the **most** important assessment for the nurse to make after a client has a femoropopliteal bypass for peripheral vascular disease?
1. Incisional pain
  2. Pedal pulse rate
  3. Degree of hair growth

4. Lower extremity color

95. Which signs cause the nurse to suspect cardiac tamponade after a client has cardiac surgery? **Select all that apply.**

1. Tachycardia
2. Hypertension
3. Increased CVP
4. Increased urine output
5. Jugular vein distention

96. A client with upper gastrointestinal (GI) bleeding develops mild anemia. What should the nurse expect to be prescribed for this client?

1. Epogen
2. Dextran
3. Iron salts
4. Vitamin B<sub>12</sub>

97. An emergency department nurse is admitting a client after an automobile collision. The health care provider estimates that the client has lost about 15% to 20% of blood volume. Which assessment finding should the nurse expect this client to exhibit?

1. Urine output of 50 mL/hr
2. Blood pressure of 150/90 mm Hg
3. Apical heart rate of 142 beats/min
4. Respiratory rate of 16 breaths/min

98. A client who is pale and moaning is diagnosed with esophageal varices and is admitted to the hospital. The health care provider orders a blood transfusion. What nursing actions should be taken?

1. Take the vital signs, verify the blood product with another nurse against the client's ID bracelet, and monitor the vital signs according to agency policy.
2. Since the vital signs were recorded during admission, hang the blood and monitor the client's vital signs every 15 minutes until the transfusion is absorbed.
3. Record the vital signs in accordance with facility policy and check the blood product against the client's ID bracelet in the presence of the nursing supervisor.
4. Take the vital signs after hanging the blood because the client is pale and moaning and is in critical condition; return in 15 minutes to monitor the vital signs.

99. A health care provider orders 1 unit of whole blood for a client after gastrointestinal surgery. What is an important nursing responsibility when administering blood?

1. Maintain patency of the IV catheter with dextrose solution.
2. Warm the blood to body temperature to prevent chilling the client.
3. Draw a blood sample from the client before each unit is transfused.
4. Run the blood at a slower rate during the first few minutes of the transfusion.

100. During a blood transfusion a client develops chills and a headache. What is the **priority** nursing action?

1. Cover the client.
2. Stop the transfusion at once.
3. Decrease the rate of the blood infusion.

4. Notify the health care provider immediately.

►101. A nurse administers 2 units of packed RBCs (250 mL each) followed by 500 mL of 0.9% sodium chloride. How much total solution (blood and sodium chloride) has infused? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

102. What is the **priority** nursing action when caring for a client with disseminated intravascular coagulation?

1. Monitor for Homan sign.
2. Avoid giving intramuscular injections.
3. Take temperatures via the rectal route.
4. Apply sequential compression stockings.

►103. A client has a low hemoglobin level, which is attributed to nutritional deficiency, and the nurse provides dietary teaching. Which food choices by the client indicate that the nurse's instructions are effective? **Select all that apply.**

1. Raisins
2. Squash
3. Carrots
4. Spinach
5. Apricots

104. A client is admitted with a higher than expected red blood cell count. What physiological alteration does the nurse expect will result from this clinical finding?

1. Increased serum pH
2. Decreased hematocrit
3. Increased blood viscosity
4. Decreased immune response

►105. A transfusion of packed red blood cells is ordered for a client with anemia. List the following actions in the order in which they should be performed by the nurse.

1. \_\_\_\_\_ Don a pair of clean gloves.
2. \_\_\_\_\_ Run the transfusion slowly.
3. \_\_\_\_\_ Determine the client's vital signs.
4. \_\_\_\_\_ Ensure that the client signed a consent for the transfusion.
5. \_\_\_\_\_ Compare the number on the blood product and laboratory record.

106. A nurse is caring for a client with an infection caused by group A beta-hemolytic streptococci. The nurse should assess this client for responses associated with which illness?

1. Hepatitis A
2. Rheumatic fever
3. Spinal meningitis
4. Rheumatoid arthritis

107. A nurse is caring for a client who is a victim of trauma and is to receive a blood transfusion. How should the nurse respond when the client expresses fear that AIDS may develop as a result of the blood transfusion?

1. "The blood is treated with radiation to kill the virus."

2. "Screening for the HIV antibodies has minimized this risk."
  3. "The ability to directly identify HIV has eliminated this concern."
  4. "Consideration should be given to donating your own blood for transfusion."
108. A client has a bone marrow aspiration performed. After the procedure, what is the **first** nursing action?
1. Position the client on the affected side.
  2. Cleanse the site with an antiseptic solution.
  3. Briefly apply pressure over the aspiration site.
  4. Begin frequent monitoring of the client's vital signs.
109. A client is diagnosed with Hodgkin disease. Which lymph nodes does the nurse expect to be affected **first**?
1. Cervical
  2. Axillary
  3. Inguinal
  4. Mediastinal
110. What group of clients should the nurse anticipate to have the highest incidence of non-Hodgkin lymphomas?
1. Children
  2. Older adults
  3. Young adults
  4. Middle-aged persons
111. A nurse is teaching a client with Hodgkin disease about responses to whole-body radiation. Which clinical indicator increase should the nurse include?
1. Blood viscosity
  2. Susceptibility to infection
  3. Red blood cell production
  4. Tendency for pathologic fractures
112. A client is started on a continuous infusion of heparin. Which finding does the nurse use to conclude that the intervention is therapeutic?
1. INR is between 2 and 3
  2. PT is  $2\frac{1}{2}$  times the control value
  3. APTT is 2 times the control value
  4. ACT is in the range of 70 and 120
113. A nurse has difficulty palpating the pedal pulse of a client with venous insufficiency. What action should the nurse take **next**?
1. Count the pulse at another site.
  2. Notify the health care provider.
  3. Lower the legs to increase blood flow.
  4. Verify the pulse by using a Doppler.
- ▶114. A nurse is completing the admission assessment of a client with peripheral arterial disease. What assessments are consistent with this diagnosis? **Select all that apply.**
1. Absence of hair on the toes
  2. Superficial ulcer with irregular edges

3. Pitting edema of the lower extremities
  4. Reports of pain associated with exercising
  5. Increased pigmentation of the medial malleolus area
115. Which relationship does the nurse consider reflective of the relationship of naloxone (Narcan) to morphine sulfate?
1. Aspirin to warfarin (Coumadin)
  2. Amoxicillin to systemic infection
  3. Protamine sulfate to parenteral heparin
  4. Enoxaparin (Lovenox) to dalteparin (Fragmin)
116. A client is receiving Coumadin (warfarin). The nurse explains the need for careful regulation of dietary intake of vitamin K. What physiologic process does vitamin K promote that makes this instruction essential?
1. Platelet aggregation
  2. Ionization of blood calcium
  3. Fibrinogen formation by the liver
  4. Prothrombin formation by the liver
117. A nurse is caring for a client with a diagnosis of polycythemia vera. The client asks, "Why do I have an increased tendency to develop blood clots?" Which effect of the polycythemia vera should the nurse explain increases the risk of these thromboses?
1. Elevated blood pressure
  2. Increased blood viscosity
  3. Fragility of the blood cells
  4. Immaturity of red blood cells
118. A client who is weak, dyspneic, and jaundiced has a bilirubin level greater than 2 mg/100 mL blood volume. With which problem are these clinical findings consistent?
1. Hemolytic anemia
  2. Pernicious anemia
  3. Decreased rate of red blood cell destruction
  4. Low oxygen-carrying capacity of erythrocytes
119. A nurse is caring for a client who had a splenectomy. For which complication should the nurse specifically assess in the immediate postoperative period?
1. Infection
  2. Peritonitis
  3. Intestinal obstruction
  4. Abdominal distention
120. A client has a splenectomy after a motor vehicle collision. What is a postoperative nursing concern specifically related to this type of surgery?
1. Pulmonary embolism
  2. Prolonged immobility
  3. Adequate lung aeration
  4. Decreased blood volume
121. What clinical finding should the nurse expect when assessing a client who had a splenectomy?

1. Lung crackles
2. Pain on inspiration
3. Shortness of breath
4. Excessive secretions

►122. The client is returned to the surgical unit from the postanesthesia care unit (PACU) after a having a splenectomy. In the immediate postoperative period, the nurse specifically should monitor for which potential complications? **Select all that apply.**

1. Shock
2. Infection
3. Intestinal obstruction
4. Abdominal distention
5. Pulmonary complications

►123. A female client has a low hemoglobin level, which is attributed to an iron deficiency. Which foods should the nurse recommend that the client increase in the diet? **Select all that apply.**

1. Spinach
2. Broccoli
3. Beef liver
4. Baked beans
5. Chicken breast

124. While being prepared for surgery for a ruptured spleen, a client complains of feeling light-headed. The client's color is pale and the pulse is rapid. What should the nurse conclude about the client's condition?

1. Hyperventilating
2. Going into shock
3. Experiencing anxiety
4. Developing an infection

# Respiratory System

▶125. A client is admitted to the hospital with a diagnosis of pneumonia. List the following nursing actions in the order they should be accomplished.

1. \_\_\_\_ Check peak and trough levels of the antibiotic.
2. \_\_\_\_ Insert an IV catheter to establish venous access.
3. \_\_\_\_ Collect a sputum sample for culture and sensitivity.
4. \_\_\_\_ Administer prescribed antibiotic intravenous piggyback.
5. \_\_\_\_ Obtain data about the client's history and physical status.

▶126. Levofloxacin (Levaquin) 750 mg IVPB is prescribed for a client with pneumonia. The dose is available in 150 mL of 5% dextrose and is to infuse over 90 minutes. The administration set has a drop factor of 15 drops per mL. At how many drops per minute should the nurse regulate the IVPB to infuse? **Record your answer using a whole number.**

Answer: \_\_\_\_ gtt/minute

127. A nurse uses abdominal-thoracic thrusts (Heimlich maneuver) when an older adult in a senior center chokes on a piece of meat. Which volume of air is the basis for the efficacy of the abdominal thrusts to expel a foreign object in the larynx?

1. Tidal
2. Residual
3. Vital capacity
4. Inspiratory reserve

128. A client states that the health care provider said the tidal volume is slightly diminished and asks the nurse what this means. Which explanation should the nurse provide about the volume of air being measured to determine tidal volume?

1. Exhaled after there is a normal inspiration
2. Exhaled forcibly after a regular expiration
3. Inspired forcibly above a typical inspiration
4. Trapped in the alveoli after a maximum expiration

129. A nurse is instructing a client to use an incentive spirometer. What client action indicates the need for further instruction?

1. Blowing vigorously into the mouthpiece
2. Getting into a chair to use the spirometer
3. Coughing deeply after using the spirometer
4. Using lips to form a seal around the mouthpiece

130. A client is scheduled for a pulmonary function test. The nurse explains that during the test one of the instructions the respiratory therapist will give the client is to breathe normally. What should the nurse teach is being measured when the client follows these directions?

1. Tidal volume
2. Vital capacity
3. Expiratory reserve
4. Inspiratory reserve

131. A nurse identifies that a client's hemoglobin level is decreasing and is concerned about tissue hypoxia. An increase in what diagnostic test result indicates an acceleration in oxygen dissociation from hemoglobin?

1. pH
2.  $\text{PO}_2$
3.  $\text{PCO}_2$
4.  $\text{HCO}_3$

132. What nursing action will limit hypoxia when suctioning a client's airway?

1. Apply suction only after catheter is inserted.
2. Limit suctioning with catheter to half a minute.
3. Lubricate the catheter with saline before insertion.
4. Use a sterile suction catheter for each suctioning episode.

133. A nurse assesses that several clients have low oxygen saturation levels. Which client would benefit the **most** from receiving oxygen via a nasal cannula?

1. Has an upper respiratory infection
2. Receives many visitors while sitting in a chair
3. Has a nasogastric tube for gastric decompression
4. Exhibits dry oral mucous membranes from mouth breathing

134. A nurse repositions a client who is diagnosed with emphysema to facilitate breathing. Which position facilitates maximum air exchange?

1. Supine
2. Orthopneic
3. Low-Fowler
4. Semi-Fowler

135. A client is admitted with suspected atelectasis. Which clinical manifestation does the nurse expect to identify when assessing this client?

1. Slow, deep respirations
2. Normal oral temperature
3. Dry, unproductive cough
4. Diminished breath sounds

►136. A client who was involved in a motor vehicle collision sustained multiple internal injuries, and thoracic surgery was performed. After surgery the client has two chest tubes attached to closed chest drainage systems. Place an X on the image on the right where the nurse should palpate to identify where the complication of subcutaneous emphysema most likely may occur.

137. A client is shot in the chest during a holdup and is transported to the hospital via ambulance. In the emergency department chest tubes are inserted, one in the second intercostal space and one at the base of the lung. What does the nurse expect the tube in the second intercostal space to accomplish?

1. Remove the air that is present in the intrapleural space
2. Drain serosanguineous fluid from the intrapleural compartment
3. Permit the development of positive pressure between the layers of the pleura
4. Provide access for the instillation of medication into the pleural space

138. How should the nurse monitor for the complication of subcutaneous emphysema after the insertion of chest tubes?

1. Palpate around the tube insertion sites for crepitus.
2. Auscultate the breath sounds for crackles and rhonchi.
3. Observe the client for the presence of a barrel-shaped chest.
4. Compare the length of inspiration with the length of expiration.

139. During the first 36 hours after the insertion of chest tubes, when assessing the function of a three-chamber, closed-chest drainage system, the nurse identifies that the water in the underwater seal tube is not fluctuating. What **initial** action should the nurse take?

1. Take the client's vital signs.
2. Inform the health care provider.
3. Turn the client to the unaffected side.
4. Check the tube to ensure that it is not kinked.

140. After a laryngectomy a client is concerned about improving the ability to

communicate. What topic should the nurse include in a teaching plan for the client?

1. Sign language
2. Body language
3. Esophageal speech
4. Computer-generated speech

141. A client has a laryngectomy. The avoidance of which activity identified by the client indicates that the nurse's teaching about activities and the stoma is understood?

1. Water sports
2. Strenuous exercises
3. Sleeping with pillows
4. High-humidity environment

142. A client is admitted for an exacerbation of emphysema. The client has a fever, chills, and difficulty breathing on exertion. What is the **priority** nursing action based on the client's history and present status?

1. Checking for capillary refill
2. Encouraging increased fluid intake
3. Suctioning secretions from the airway
4. Administering a high concentration of oxygen

143. A nurse is caring for clients whose histories include various health problems. These problems include scarlet fever, otitis media, bacterial endocarditis, rheumatic fever, and glomerulonephritis. What common factor linking these diseases should the nurse consider?

1. Are self-limiting infections caused by spirilla
2. Can be controlled through childhood vaccination
3. Are caused by parasitic bacteria that normally live outside the body
4. Result from streptococcal infections that enter via the upper respiratory tract

144. A client is admitted to the intensive care unit with acute pulmonary edema. Which rapidly acting intravenous diuretic should the nurse anticipate will be prescribed?

1. Furosemide (Lasix)
2. Chlorothiazide (Diuril)
3. Spironolactone (Aldactone)
4. AcetaZOLAMIDE (Diamox)

145. What nursing action will **most** help a client obtain maximum benefits after postural drainage?

1. Administer prn oxygen.
2. Encourage coughing deeply.
3. Place the client in a sitting position.
4. Encourage the client to rest for a half hour.

146. A client with emphysema experiences a sudden episode of shortness of breath and is diagnosed with a spontaneous pneumothorax. The client asks, "How could this have happened?" What likely cause of the spontaneous pneumothorax should the nurse's response take into consideration?

1. Pleural friction rub

2. Tracheoesophageal fistula
3. Rupture of a subpleural bleb
4. Puncture wound of the chest wall

147. A client is diagnosed with emphysema. For what long-term problem should the nurse monitor this client?

1. Localized tissue necrosis
2. Carbon dioxide retention
3. Increased respiratory rate
4. Saturated hemoglobin molecules

148. A spontaneous pneumothorax is suspected in a client with a history of emphysema. In addition to calling the health care provider, what action should the nurse take?

1. Place the client on the unaffected side.
2. Administer 60% oxygen via a Venturi mask.
3. Prepare for IV administration of electrolytes.
4. Give oxygen at 2 L per minute via nasal cannula.

149. A client is diagnosed with a spontaneous pneumothorax. Which physiologic effect of a spontaneous pneumothorax should the nurse include in a teaching plan for the client?

1. Air will move from the lung into the pleural space.
2. The heart and great vessels shift toward the affected side.
3. There is greater negative pressure within the chest cavity.
4. Collapse of the other lung will occur if not treated immediately.

►150. What clinical indicators should the nurse expect to identify when assessing an individual with a spontaneous pneumothorax? **Select all that apply.**

1. Hematemesis
2. Shortness of breath
3. Unilateral chest pain
4. Increased thoracic motion
5. Mediastinal shift toward the involved side

►151. A client has a pneumothorax, and a closed-chest drainage system is inserted to allow the lung to reinflate. Identify the chamber in the figure below that provides the water seal.

1. A
2. B
3. C
4. D

152. What is the underlying rationale why a nurse assesses a client with emphysema for clinical indicators of hypoxia?

1. Pleural effusion
2. Infectious obstructions
3. Loss of aerating surface
4. Respiratory muscle paralysis

153. A nurse administers oxygen at 2 L/min via nasal cannula to a client with emphysema. For which clinical indicators should the nurse closely observe the client?

**Select all that apply.**

1. Anxiety
2. Cyanosis
3. Drowsiness
4. Mental confusion
5. Increased respirations

154. A nurse is teaching breathing exercises to a client with emphysema. What is the reason the nurse should include in the teaching as to why these exercises are necessary to promote effective use of the diaphragm?

1. The residual capacity of the lungs has been increased.
2. Inspiration has been markedly prolonged and difficult.
3. The client has an increase in the vital capacity of the lungs.
4. Abdominal breathing is an effective compensatory mechanism and is spontaneously

initiated.

155. While receiving an adrenergic beta<sub>2</sub> agonist drug for asthma, the client complains of palpitations, chest pain, and a throbbing headache. What is the **most** appropriate nursing action?

1. Withhold the drug until additional orders are obtained.
2. Tell the client not to worry; these are expected side effects from the medicine.
3. Ask the client to relax; then give instructions to breathe slowly and deeply for several minutes.
4. Explain that the effects are temporary and will subside as the body becomes accustomed to the drug.

156. What is the **priority** goal for a client with asthma who is being discharged from the hospital?

1. Is able to obtain pulse oximeter readings
2. Demonstrates use of a metered-dose inhaler
3. Knows the health care provider's office hours
4. Can identify the foods that may cause wheezing

157. A client with a long history of asthma is scheduled for surgery. What information should be included in preoperative teaching?

1. There is an increased risk of respiratory tract infections.
2. Relaxation techniques limit the severity of asthmatic attacks.
3. Coughing forcibly must be avoided because it increases the intrathoracic pressure.
4. Local anesthesia is preferred because it has fewer side effects than general anesthesia.

158. A client with asthma is being taught how to use a peak flow meter to monitor how well the asthma is being controlled. What should the nurse instruct the client to do?

1. Perform the procedure once in the morning and once at night
2. Move the trunk to an upright position and then exhale while bending over
3. Inhale completely and then blow out as hard and as fast as possible through the mouthpiece
4. Place the mouthpiece between the lips and in front of the teeth before starting the procedure

159. When a client suffers a complete pneumothorax, there is danger of a mediastinal shift. If such a shift occurs, what potential effect is a cause for concern?

1. Rupture of the pericardium
2. Infection of the subpleural lining
3. Decreased filling of the right heart
4. Increased volume of the unaffected lung

160. A chest tube is inserted into a client who was stabbed in the chest and is attached to a closed-drainage system. Which is an important nursing intervention when caring for this client?

1. Observe for fluid fluctuations in the water-seal chamber.
2. Obtain a prescription for morphine to minimize agitation.
3. Apply a thoracic binder to prevent excessive tension on the tube.
4. Clamp the tubing securely to prevent a rapid decline in pressure.

161. A client has chest tubes attached to a chest tube drainage system. What should the nurse do when caring for this client?

1. Clamp the chest tubes when suctioning.
2. Palpate the surrounding area for crepitus.
3. Change the dressing daily using aseptic technique.
4. Empty the drainage chamber at the end of the shift.

162. A nurse is caring for a variety of clients. For which client is it **most** essential for the nurse to implement measures to prevent pulmonary embolism?

1. 59-year-old who had a knee replacement
2. 60-year-old who has bacterial pneumonia
3. 68-year-old who had emergency dental surgery
4. 76-year-old who has a history of thrombocytopenia

163. A nurse is caring for a group of clients on a medical-surgical unit. Which client has the highest risk for developing a pulmonary embolism?

1. Obese client with leg trauma
2. Pregnant client with acute asthma
3. Client with diabetes who has cholecystitis
4. Client with pneumonia who is immunodeficient

164. A graduate nurse reminds a client who just had a laryngoscopy not to take anything by mouth until instructed to do so. What conclusion should be made about this intervention by the nurse preceptor who is evaluating the performance of the graduate nurse?

1. Appropriate, because such clients usually experience painful swallowing for several days
2. Appropriate, because early eating or drinking after such a procedure may cause aspiration
3. Inappropriate, because the client is likely to be anxious and it is easier to remove the water pitcher
4. Inappropriate, because the client is conscious and may be thirsty after not being allowed to drink fluids

165. A client has a bronchoscopy in the ambulatory surgery unit. What action should the nurse take to prevent laryngeal edema?

1. Place ice chips in the client's mouth.
2. Offer liberal amounts of fluid to the client.
3. Keep the client in the semi-Fowler position.
4. Tell the client to suck on medicated lozenges.

166. After a bronchoscopy because of suspected cancer of the lung, a client develops pleural effusion. What should the nurse conclude is the **most** likely cause of the pleural effusion?

1. Excessive fluid intake
2. Inadequate chest expansion
3. Extension of cancerous lesions
4. Irritation from the bronchoscopy

167. A client who is to be admitted for minor surgery has a chest radiograph as part of the presurgical physical. The nurse is notified that the radiograph reveals that the client has pulmonary tuberculosis. What evidence of tuberculosis is provided by the radiograph?

1. Sensitized T cells
2. Presence of acid-fast bacilli
3. Cavities caused by caseation
4. Microscopic primary infection

▶168. An older adult, who alternately lives in a homeless shelter and on the street, is brought to the emergency department by friends. The client has a fever, night sweats, and a blood-tinged productive cough. The health care provider suspects that the client has tuberculosis and orders a purified protein derivate (PPD) test, chest x-ray, and sputum culture. Place these interventions in the order that they should be performed.

1. \_\_\_\_ Obtain a sputum specimen.
2. \_\_\_\_ Institute airborne precautions.
3. \_\_\_\_ Have a chest x-ray performed.
4. \_\_\_\_ Notify the Department of Health.
5. \_\_\_\_ Perform a PPD intradermal skin test.

▶169. A nurse assesses a newly admitted client with a diagnosis of pulmonary tuberculosis (TB). Which clinical findings support this diagnosis? **Select all that apply.**

1. Fatigue
2. Polyphagia
3. Hemoptysis
4. Night sweats
5. Black tongue

170. A client who is taking rifampin (Rifadin) tells the nurse, "My urine looks orange." What action should the nurse take?

1. Explain this is expected.
2. Check the liver enzymes.
3. Strain the urine for stones.
4. Ask what foods were eaten.

171. What must the nurse determine before discontinuing airborne precautions for a client with pulmonary tuber-culosis?

1. Client no longer is infected.
2. Tuberculin skin test is negative.
3. Sputum is free of acid-fast bacteria.
4. Client's temperature has returned to normal.

172.▶ What interventions should the nurse anticipate will be ordered for a client who has a leak of the thoracic duct following radical neck surgery? **Select all that apply.**

1. Bed rest to conserve energy
2. Chest tube to drain the fluid
3. High-fat diet to provide calories
4. Rectal tube to prevent distention

5. Total parenteral nutrition to boost immune defenses

173. A client has a laryngectomy and radical neck dissection for cancer of the larynx. Two tubes from the area of the incision are connected to portable wound drainage systems. Inspection of the neck reveals moderate edema even though the drainage systems are functioning. For which clinical indicator should the nurse assess the client?

1. Crackles
2. Restlessness
3. Loss of the gag reflex
4. Cloudy wound drainage

174. What should the nurse include in the plan of care for a client who just had a total laryngectomy?

1. Instructing the client to whisper
2. Removing the outer tracheostomy tube prn
3. Placing the client in the orthopneic position
4. Suctioning the tracheostomy tube whenever necessary

175. Which nursing action is important when suctioning the secretions of a client with a tracheostomy?

1. Use a new sterile catheter with each insertion.
2. Initiate suction as the catheter is being withdrawn.
3. Insert the catheter until the cough reflex is stimulated.
4. Remove the inner cannula before inserting the suction catheter.

176. A client just had a thoracentesis. For which response is it **most** important for the nurse to observe the client?

1. Signs of infection
2. Expectoration of blood
3. Increased breath sounds
4. Decreased respiratory rate

177. A client with a pulmonary embolus is intubated and placed on mechanical ventilation. What nursing action is important when suctioning the endotracheal tube?

1. Apply negative pressure while inserting the suction catheter.
2. Hyperoxygenate with 100% oxygen before and after suctioning.
3. Suction 2 to 3 times in succession to effectively clear the airway.
4. Use rapid movements of the suction catheter to loosen secretions.

►178. In the first  $2\frac{1}{2}$  hours after a radical neck dissection, 40 mL of medium red, bloody fluid is obtained from the client's drainage system. What should the nurse do? **Select all that apply.**

1. Take vital signs.
2. Change the dressing.
3. Apply pressure over the site.
4. Elevate the lower extremities.
5. Notify the health care provider.

►179. The nurse should refer a client to the pulmonary clinic for suspected tuberculosis based on which clinical indicators reported during the **initial** client interview? **Select all**

**that apply.**

1. Vomiting
2. Chest pain
3. Hemoptysis
4. Night sweats
5. Bilateral crackles

►180. A nurse must administer streptomycin 1 g IM to a client with tuberculosis. The vial contains 500 mg/mL. How much solution must the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

181. Which intervention should the nurse implement to help prevent atelectasis in a client with fractured ribs as a result of chest trauma?

1. Apply a thoracic binder for support.
2. Encourage coughing and deep breathing.
3. Defer pain medication the first day after injury.
4. Position the client face-down on a soft mattress.

182. The arterial blood gases of a client with chronic obstructive pulmonary disease (COPD) deteriorate, and respiratory failure is impending. For which clinical indicator should the nurse assess **first**?

1. Cyanosis
2. Bradycardia
3. Mental confusion
4. Distended neck veins

183. A nurse is caring for a client with severe dyspnea who is receiving oxygen via a Venturi mask. What should the nurse do when caring for this client?

1. Assess frequently for nasal drying.
2. Keep the mask tight against the face.
3. Monitor oxygen saturation levels when eating.
4. Set the oxygen flow at the highest setting possible.

►184. A nurse is caring for a client with a Venturi mask who is receiving 40% oxygen. What nursing actions are indicated? **Select all that apply.**

1. Keep the oxygen source higher than the client's airway.
2. Adjust the liter flow according to the oxygen saturation.
3. Prevent the client's blanket from covering the adaptor's orifices.
4. Ensure that the bag does not deflate completely during inspiration.
5. Check that the appropriate adaptor to deliver the prescribed  $\text{FiO}_2$  is attached to the mask.

185. A nurse is administering oxygen to a client with chest pain who is restless. What method of oxygen administration will **most** likely prevent a further increase in the client's anxiety level?

1. Cannula
2. Catheter
3. Venturi mask

4. Rebreather mask

186. A client who has acquired immunodeficiency syndrome develops bacterial pneumonia. On admission to the emergency department, the client's PaO<sub>2</sub> is 80 mm Hg. When the arterial blood gases are drawn again, the level is determined to be 65 mm Hg. What should the nurse do **first**?

1. Increase the oxygen flow rate.
2. Notify the health care provider.
3. Decrease the tension of oxygen in the plasma.
4. Have the arterial blood gases redone to verify accuracy.

187. In addition to treatment of the underlying cause, which medical intervention should the nurse anticipate will be included in the management of a client with acute respiratory distress syndrome (ARDS)?

1. Chest tube insertion
2. Aggressive diuretic therapy
3. Administration of beta blockers
4. Positive end-expiratory pressure

188. When caring for an intubated client receiving mechanical ventilation, the nurse hears the high-pressure alarm. Which action is **most** appropriate?

1. Remove secretions by suctioning.
2. Lower the setting of the tidal volume.
3. Check that tubing connections are secure.
4. Obtain a specimen for arterial blood gases.

189. A client has an endotracheal tube and is receiving mechanical ventilation. The nurse identifies that periodic suctioning may be necessary. The nurse follows a specific protocol when performing this procedure. Place the steps in the order that they should be performed.

1. \_\_\_\_ Obtain the vital signs.
2. \_\_\_\_ Auscultate lung sounds.
3. \_\_\_\_ Hyperoxygenate for 30 seconds.
4. \_\_\_\_ Suction for approximately 10 seconds.
5. \_\_\_\_ Rotate the catheter during its withdrawal.

190. A nurse is involved in an international committee to address global health problems. What suggestion is most appropriate for the nurse to make to **best** meet the challenge associated with a potential emerging influenza pandemic?

1. Stockpile antibiotics.
2. Establish a global surveillance plan.
3. Limit vaccination programs to school-age children.
4. Initiate vaccination programs during the months of August and September.

191. A nurse works with a large population of immigrant clients and is concerned about the debilitating effects of influenza. Which action is the **first** line of defense against an emerging influenza pandemic?

1. Complying with quarantine measures
2. Instituting strict international travel restrictions

3. Seeking aid from the international public health community
4. Reporting surveillance findings to appropriate public health officials

# Gastrointestinal System

192. A nurse is planning a community health program about screening for cancer. Which information recommended by the American Cancer Society (ACS) should the nurse include?

1. Mammography should be performed annually after age 35 years for women.
2. Fecal occult blood testing should be performed yearly beginning at age 50 years.
3. Breast self-examination should be performed monthly beginning at age 30 years.
4. Digital rectal exams and PSA testing should be done yearly after age 40 for men.

193. A nurse is teaching an athletic teenager about nutrients that provide the quickest source of energy. Which food selected from a menu indicates to the nurse that the adolescent understands the teaching?

1. Glass of milk
2. Slice of bread
3. Chocolate candy bar
4. Glass of orange juice

194. A nurse identifies that the client understands information about vitamin K when the client states, "Vitamin K is:

1. found in a variety of foods, so there is no danger of deficiency."
2. easily absorbed without assistance, so everything eaten is absorbed."
3. rarely found in dietary foods, so a natural deficiency can easily occur."
4. produced in sufficient amounts by intestinal bacteria, so metabolic needs are met."

195. A client describes abdominal discomfort following ingestion of milk. Which enzyme, as a result of a genetic deficiency, should the nurse consider to be the cause of the client's discomfort?

1. Lactase
2. Sucrase
3. Maltase
4. Amylase

196. A nurse is caring for a client who is cachectic. What information about the function of adipose tissue in fat metabolism is necessary to better address the needs of this client?

1. Releases glucose for energy
2. Regulates cholesterol production
3. Uses lipoproteins for fat transport
4. Stores triglycerides for energy reserves

197. A nurse is teaching a client about the differences between the terms *saturated* and *unsaturated*, when used in reference to fats. Which important factor in relation to these types of fats should the nurse include in the teaching?

1. Taste
2. Color
3. Density
4. Digestibility

198. A nurse is teaching menu planning to a client who has a high triglyceride level.

Which nutrient avoided by the client indicates that teaching about foods that are high in fat was understood?

1. Fruits
2. Grains
3. Red meat
4. Vegetable oils

199. A client with a high cholesterol level says to the nurse, "Why can't the doctor just give me a medication to eliminate all the cholesterol in my body so it isn't a problem?"

Which factor related to why cholesterol is important in the human body should the nurse include in a response to the client's question?

1. Blood clotting
2. Bone formation
3. Muscle contraction
4. Cellular membranes

200. Which statement made by a client after attending a class on nutrition indicates an understanding of the importance of essential amino acids?

1. "Amino acids can be made by the body because they are essential to life."
2. "They come from the diet because they cannot be synthesized in the body."
3. "They are used in key processes essential for growth once they are synthesized by the body."
4. "Essential amino acids are required for metabolism, whereas the other amino acids are not."

201. A nurse provides dietary teaching about a low-sodium diet for a client with hypertension. Which nutrient selected by the client indicates an understanding about foods that are low in natural sodium?

1. Milk
2. Meat
3. Fruits
4. Vegetables

202. Megadoses of vitamin A are taken by a client. Why should the nurse question this practice?

1. Vitamin A is highly toxic, even in small amounts.
2. The liver has a great storage capacity for vitamin A, even to toxic amounts.
3. Vitamin A cannot be stored, therefore excess amounts will saturate the general body tissues.
4. Although the body's requirement for vitamin A is great, the cells can synthesize more as needed.

203.▶ A nurse is teaching about excellent food sources of vitamin A for a client who is deficient in this vitamin. Which foods should the nurse include in the teaching? **Select all that apply.**

1. Carrots
2. Oranges
3. Tomatoes

4. Skim milk

5. Leafy greens

204. A client who recently immigrated to the United States has a chronic vitamin A deficiency. What information about vitamin A should the nurse consider when assessing this client for clinical indicators of this deficiency?

1. Vitamin A is an integral part of the retina's pigment called melanin.
2. It is a component of the rods and cones, which control color visualization.
3. Vitamin A is the material in the cornea that prevents the formation of cataracts.
4. It is a necessary element of rhodopsin, which controls responses to light and dark environments.

205. A client is to have gastric gavage. In which position should the nurse place the client when the nasogastric tube is being inserted?

1. Supine
2. Mid-Fowler
3. High-Fowler
4. Trendelenburg

206. A client with the diagnosis of cancer of the stomach expresses aversion to meals and eats only small amounts. What should the nurse provide?

1. Nourishment between meals
2. Small portions more frequently
3. Supplementary vitamins to stimulate the client's appetite
4. Only foods the client likes in small portions at mealtimes

207. A health care provider schedules a paracentesis. What should the nurse instruct the client to do to prepare for the procedure?

1. Empty the bladder before the procedure.
2. Take a laxative the evening before the procedure.
3. Ingest nothing by mouth for 8 hours before the procedure.
4. Self-administer a low soapsuds enema 2 hours before the procedure.

208. A health care provider orders an upper GI series and a barium enema. The client asks, "Why do I have to have barium for these tests?" The nurse's **best** response is "Barium:

1. gives off visible light, illuminating the alimentary tract."
2. provides fluorescence, thereby lighting up the alimentary tract."
3. dyes the structures of the alimentary tract, making them more visible."
4. gives more contrast to the soft tissue of the alimentary tract, allowing absorption of x-rays."

209. A client is scheduled for a sigmoidoscopy. What instruction should the nurse provide the client in preparation for this diagnostic procedure?

1. Have an enema the morning of the test.
2. A chalklike substance will have to be swallowed.
3. Withhold food for twenty-four hours before the test.
4. A sterile container will be provided for the collection of a stool specimen.

210. A health care provider orders a sigmoidoscopy for one client and a barium enema

for another client. What is a nursing responsibility common to preparing both of these clients for these procedures?

1. Withholding food for several hours
2. Giving castor oil the afternoon before
3. Administering soapsuds enemas until clear
4. Ensuring an understanding of the procedure

211. A high-cleansing enema is ordered for a client. What is the maximum height at which the container of fluid should be held by the nurse when administering this enema?

1. 30 cm (12 inches)
2. 37 cm (15 inches)
3. 51 cm (20 inches)
4. 66 cm (26 inches)

212. During administration of an enema, a client reports having intestinal cramps. What should the nurse do?

1. Discontinue the procedure.
2. Instill the fluid at a slower rate.
3. Lower the height of the container.
4. Stop the fluid until the cramps subside.

213. A nurse is evaluating a client's response to receiving an intermittent gravity flow percutaneous endoscopic gastrostomy (PEG) tube feeding. Which clinical finding indicates that the client is unable to tolerate a continuation of the feeding?

1. Passage of flatus
2. Rise of formula in the tube
3. Rapid inflow of the feeding
4. Tenderness of epigastric area

214. A client has a nasogastric feeding tube inserted, and the health care provider orders the prescribed feeding to be instituted immediately. What should the nurse do **first**?

1. Instill normal saline into the tube to maintain patency.
2. Obtain an x-ray to verify that the tube is in the stomach.
3. Auscultate the epigastric area while instilling 15 mL of air.
4. Withdraw 30 mL of stomach contents to verify tube placement.

215. Three days after admission to the hospital for a brain attack (cerebrovascular accident [CVA]), a client has a nasogastric tube inserted and is receiving continuous tube feedings. What should the nurse do to **best** evaluate whether the feeding is being absorbed?

1. Aspirate for a residual volume.
2. Evaluate the intake in relation to the output.
3. Instill air into the client's stomach while auscultating.
4. Compare the client's body weight with the baseline data.

216. A client is receiving hypertonic tube feedings. What should the nurse consider to be the main reason this client may experience diarrhea?

1. Increased fiber intake

2. Bacterial contamination
3. Inappropriate positioning
4. High osmolarity of the feedings

217. A health care provider orders intermittent nasogastric tube feeding to supplement a client's oral nutritional intake. Which hazard associated with a nasogastric tube feeding will be reduced if the nurse administers this feeding over 30 to 60 minutes?

1. Distention
2. Flatulence
3. Indigestion
4. Regurgitation

218. A client has a fractured mandible that is immobilized with wires. For which life-threatening postoperative problem should the nurse monitor this client?

1. Infection
2. Vomiting
3. Osteomyelitis
4. Bronchospasm

219. A client who had an incision and drainage of an oral abscess is to be discharged. For which clinical finding, if it should occur, should the nurse instruct the client to notify the health care provider?

1. Foul odor to the breath
2. Pain associated with swallowing
3. Pain with swelling after one week
4. Tenderness in the mouth when chewing

220. A nurse is obtaining a history and performing a physical assessment of a client who has cancer of the tongue. Which clinical findings should the nurse expect to identify?

**Select all that apply.**

1. Halitosis
2. Leukoplakia
3. Bleeding gums
4. Substernal pain
5. Alterations in taste
6. Enlarged cervical lymph nodes

221. A nurse is collecting a health history from a client who has a diagnosis of cancer of the tongue. For which risk factor commonly associated with cancer of the tongue should the nurse assess when collecting the client's history?

1. Nail biting
2. Poor dental habits
3. Frequent gum chewing
4. Large consumption of alcohol

222. A client with gastroesophageal reflux disease reports having difficulty sleeping at night. What should the nurse instruct the client to do?

1. Drink a glass of milk before retiring.
2. Elevate the head of the bed on blocks.

3. Eliminate carbohydrates from the diet.
4. Take antacids such as sodium bicarbonate.

▶223. A client with gastroesophageal reflux is to receive metoclopramide (Reglan) 15 mg orally before meals. The concentrated solution contains 10 mg/mL. How much solution should the nurse administer? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

▶224. A nurse is providing discharge instructions for a client with a diagnosis of gastroesophageal reflux disease (GERD). What should the nurse advise the client to do to limit symptoms of GERD? **Select all that apply.**

1. Avoid heavy lifting.
2. Lie down after eating.
3. Avoid drinking alcohol.
4. Eat small, frequent meals.
5. Increase fluid intake with meals.
6. Wear an abdominal binder or girdle.

225. A client with gastric ulcer disease asks the nurse why the health care provider has prescribed metronidazole (Flagyl). The nurse explains, "Antibiotics are prescribed to:

1. augment the immune response."
2. potentiate the effect of antacids."
3. treat *Helicobacter pylori* infection."
4. reduce hydrochloric acid secretion."

▶226. A client with gastroesophageal reflux disease (GERD) should make diet and lifestyle changes. What instructions should the nurse include in the client's discharge teaching? **Select all that apply.**

1. Add milk to coffee.
2. Elevate the foot of the bed.
3. Avoid caffeine-containing products.
4. Eat three evenly spaced meals daily.
5. Chew thoroughly while eating slowly.

227. A client with esophageal cancer is to receive total parenteral nutrition. A right subclavian catheter is inserted. What should the nurse consider is the **primary** reason why the health care provider ordered a central line?

1. It prevents the development of infection.
2. There is less chance of this infusion infiltrating.
3. It is more convenient so clients can use their hands.
4. The large amount of blood helps to dilute the concentrated solution.

228. A client with inflammatory bowel disease is receiving total parenteral nutrition (TPN) via an infusion pump. What is **most** important for the nurse to do when administering TPN?

1. Monitor the client's blood glucose level q2h at the bedside with a glucometer.
2. Change the TPN solution bag every 24 hours, even if there is solution left in the bag.
3. Instruct the client to breathe shallowly when changing the TPN tubing using sterile technique.

4. Speed up the rate of the TPN infusion if the amount delivered has fallen behind the prescribed hourly rate.

229. A client has a suspected peptic ulcer in the duodenum. What should the nurse expect the client to report when describing the pain associated with this disease?

1. An ache radiating to the left side
2. An intermittent colicky flank pain
3. A gnawing sensation relieved by food
4. A generalized abdominal pain intensified by moving

230. Famotidine (Pepcid) 20 mg IVPB is prescribed for a client with a duodenal ulcer. The medication is diluted in 50 milliliters of 5% dextrose and is to infuse over 15 minutes. At what rate should the infusion control device be set? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL/hr

231. A client is scheduled for a pyloroplasty and vagotomy because of strictures caused by ulcers unresponsive to medical therapy. What information about the purpose of a vagotomy should the nurse include when reviewing the health care provider's discussion with the client?

1. Increases the heart rate
2. Hastens gastric emptying
3. Eliminates pain sensations
4. Decreases secretions in the stomach

232. After a subtotal gastrectomy for cancer of the stomach, a client develops dumping syndrome. The client says, "What does it mean when the health care provider said that I am experiencing dumping syndrome?" What information should the nurse include in a response to this question?

1. Nausea resulting from a full stomach
2. Reflux of gastric contents into the esophagus
3. Buildup of flatulence within the large intestine
4. Rapid passage of concentrated fluid into the small intestine

233. An exploratory laparotomy is performed on a client with melena, and gastric cancer is discovered. A partial gastrectomy is performed, and a jejunostomy tube is surgically implanted. A nasogastric tube to suction is in place. What should the nurse expect regarding the client's nasogastric tube drainage during the **first** 24 hours after surgery?

1. Green and viscid
2. Contain some blood and clots
3. Contain large amounts of frank blood
4. Similar to coffee grounds in color and consistency

234. Two hours after a subtotal gastrectomy, the nurse identifies that the drainage from the client's nasogastric tube is bright red. What should the nurse do **first**?

1. Notify the health care provider.
2. Clamp the nasogastric tube for one hour.
3. Determine that this is an expected finding.
4. Irrigate the nasogastric tube with iced saline.

235. A client is admitted to the surgical unit from the postanesthesia care unit with a Salem sump nasogastric tube that is to be attached to wall suction. Which nursing action should the nurse implement when caring for this client?

1. Use normal saline to irrigate the tube.
2. Employ sterile technique when irrigating the tube.
3. Withdraw the tube quickly when decompression is terminated.
4. Allow the client to have small sips of ice water unless nauseated.

236. After a partial gastrectomy is performed, a client is returned from the postanesthesia care unit to the surgical unit with an IV solution infusing and a nasogastric tube in place. The nurse identifies that there is no nasogastric drainage for 30 minutes. There is an order for instillation of the nasogastric tube prn. The nurse should instill:

1. 30 mL of normal saline and continue the suction.
2. 20 mL of air and clamp off the suction for 1 hour.
3. 50 mL of saline and increase the pressure of the suction.
4. 15 mL of distilled water and disconnect the suction for 30 minutes.

237. A client is admitted to the hospital with a diagnosis of intestinal obstruction. The health care provider orders intestinal suction via a nasoenteric decompression tube. The loss of which constituents associated with intestinal suctioning is **most** important to consider when caring for this client?

1. Protein enzymes
2. Energy carbohydrates
3. Vitamins and minerals
4. Water and electrolytes

238. When an intestinal obstruction is suspected, a client has a nasogastric tube inserted and attached to suction. For what response should the nurse critically assess this client?

1. Edema
2. Belching
3. Fluid deficit
4. Excessive salivation

239. A nurse designs a health teaching program specifically for a client who had a gastrectomy. What should this plan include?

1. Information about how to limit and prevent dumping syndrome
2. An explanation of the therapeutic effect of a high-roughage diet
3. A list of foods that cause gas in the intestine and how to avoid them
4. Encouragement to resume previous eating habits as soon as possible

240. When caring for a client who is recovering from a gastrectomy, a nurse is concerned about the potential development of pernicious anemia. What should the nurse conclude may be the cause of this complication?

1. Vitamin B<sub>12</sub> is just absorbed in the stomach.
2. Hemopoietic factor is secreted in the stomach.
3. Parietal cells of the stomach secrete the intrinsic factor.
4. Chief cells in the stomach promote the secretion of the extrinsic factor.

241. After a subtotal gastrectomy a client is returned to the surgical unit. Which is the **best** nursing action to prevent pulmonary complications?

1. Ambulating the client to increase respiratory exchange
2. Promoting frequent turning and deep breathing to mobilize secretions
3. Maintaining a consistent oxygen flow rate to increase oxygen saturation
4. Keeping a plastic airway in place to ensure patency of the client's airway

242. An older adult is returned to the surgical unit after having a subtotal gastrectomy. Which dietary modification should the nurse anticipate that the health care provider will **most** likely order?

1. Increase intake of dietary roughage slowly.
2. Avoid oral feedings for a prolonged period.
3. Resume small, easily digested feedings gradually.
4. Limit intake to self-selection of personally preferred foods.

243. To help prevent long-term complications associated with gastric bypass surgery, the nurse needs to educate the client. Identify the factors that should be included in the nurse's teaching plan for this client. **Select all that apply.**

1. Eat foods rich in calcium.
2. Ingest 3 small feedings daily.
3. Limit fluids to 1500 mL daily.
4. Consume a diet high in protein.
5. Receive vitamin B<sub>12</sub> injections routinely.

244. Six weeks after discharge, a client with a jejunoileal bypass for morbid obesity returns to the outpatient clinic reporting palpitations, abdominal cramps, diarrhea, and dizziness 30 minutes after meals. What complication should the nurse consider that the client is **most** likely experiencing?

1. Gastric reflux
2. Reflux gastritis
3. Dumping syndrome
4. Abdominal peritonitis

245. Which statement by a client who is scheduled for bariatric surgery indicates to the nurse that further preoperative teaching is necessary?

1. "I need to eat more high-protein foods."
2. "I'm going to have a figure like a model in about a year."
3. "I'm going to be out of bed and sitting in a chair the first day after surgery."
4. "I will be limiting my intake to 600 to 800 calories a day once I start eating again."

246. A nurse is preparing a morbidly obese client for gastric bypass surgery. What should the nurse teach the client to do after surgery?

1. Take medications in liquid form.
2. Lie on the right side for 1 hour after meals.
3. Ingest a high-carbohydrate diet once eating is resumed.
4. Receive patient-controlled analgesia for 6 days after surgery.

247. Which clinical indicator should the nurse identify before scheduling a client for an endoscopic retrograde cholangiopancreatography (ERCP)?

1. Urine output
2. Bilirubin level
3. Blood pressure
4. Serum glucose

▶248. A client is discharged the same day after ambulatory surgery for a laparoscopic cholecystectomy. The nurse is providing discharge teaching about how many days the client should wait to engage in certain activities. Place in order the activities from the first to the last in which the client may engage.

1. \_\_\_\_\_ Showering
2. \_\_\_\_\_ Driving a car
3. \_\_\_\_\_ Performing light exercise
4. \_\_\_\_\_ Getting out of bed in a chair
5. \_\_\_\_\_ Lifting objects of more than ten pounds

249. A nurse is preparing a teaching plan for a client with a history of cholelithiasis. Which information about why the ingestion of fatty foods will cause discomfort should the nurse include in the teaching plan?

1. Fatty foods are hard to digest.
2. Bile flow into the intestine is obstructed.
3. The liver is manufacturing inadequate bile.
4. There is inadequate closure of the ampulla of Vater.

▶250. A nurse is caring for a client with cholelithiasis and obstructive jaundice. When assessing this client, the nurse should be alert for which common clinical indicators associated with these conditions? **Select all that apply.**

1. Ecchymosis
2. Yellow sclera
3. Dark brown stool
4. Straw-colored urine
5. Pain in right upper quadrant

▶251. For which clinical indicators should the nurse monitor when caring for a client with cholelithiasis and obstructive jaundice? **Select all that apply.**

1. Dark urine
2. Yellow skin
3. Pain on urination
4. Clay-colored stool
5. Coffee-ground vomitus

252. Before a cholecystectomy vitamin K is prescribed. Which element, formed in the presence of vitamin K, should the nurse determine is the purpose of administering this medication?

1. Bilirubin
2. Prothrombin
3. Thromboplastin
4. Cholecystokinin

253. A client is returned to the surgical unit after an abdominal cholecystectomy. What is

the **main** reason why the nurse should assess for clinical indicators of respiratory complications?

1. Length of time required for surgery is prolonged.
2. Incision is in close proximity to the client's diaphragm.
3. Client's resistance is lowered because of bile in the blood.
4. Bloodstream is invaded by microorganisms from the biliary tract.

254. A client with a history of pancreatitis is scheduled for surgery to excise a pseudocyst of the pancreas. The client asks, "What is a pseudocyst?" What information should the nurse include in a response to this question?

1. Malignant growth
2. Pocket of undigested food particles
3. Dilated space of necrotic tissue and blood
4. Sack filled with fluid and pancreatic enzymes

255. A nurse is caring for a client with a diagnosis of acute pancreatitis and alcoholism. The client asks, "What does my drinking have to do with my diagnosis?" What effect of alcohol should the nurse include when responding?

1. Promotes the formation of calculi in the cystic duct
2. Stimulates the pancreas to secrete more insulin than it can immediately produce
3. Alters the composition of enzymes so they are capable of damaging the pancreas
4. Increases enzyme secretion and pancreatic duct pressure that causes backflow of enzymes into the pancreas

256. A client is diagnosed with cancer of the pancreas and is apprehensive and restless. Which nursing action should be included in the plan of care?

1. Encouraging expression of concerns
2. Administering antibiotics as prescribed
3. Teaching the importance of getting rest
4. Explaining that everything will be all right

▶257. A client is admitted with a tentative diagnosis of pancreatitis. The medical and nursing measures for this client are aimed toward maintaining nutrition, promoting rest, maintaining fluid and electrolyte balance, and decreasing anxiety. Which interventions should the nurse implement? **Select all that apply.**

1. Provide a low-fat diet.
2. Administer analgesics.
3. Teach relaxation exercises.
4. Encourage walking in the hall.
5. Monitor cardiac rate and rhythm.
6. Observe for signs of hypercalcemia.

▶258. A client is recovering from an acute episode of alcoholism that included esophageal involvement. What are the components of a therapeutic diet that are **most** appropriate for the nurse to include in the teaching plan for this client? **Select all that apply.**

1. Soft diet
2. Regular diet
3. Low-protein diet

4. High-protein diet
5. Low-carbohydrate diet
6. High-carbohydrate diet

259. Thiamine (vitamin B<sub>1</sub>) and niacin (vitamin B<sub>3</sub>) are prescribed for a client with alcoholism. Which body function maintained by these vitamins should the nurse include in a teaching plan?

1. Neuronal activity
2. Bowel elimination
3. Efficient circulation
4. Prothrombin development

260. A client is admitted to the hospital with a diagnosis of alcohol withdrawal syndrome. What body organ should the nurse teach the client will be protected by the ingestion of a high-calorie diet fortified with vitamins?

1. Liver
2. Heart
3. Pancreas
4. Adrenals

261. A nurse is teaching a class about hepatitis, specifically hepatitis A. Which food should the nurse explain will **most** likely remain contaminated with the hepatitis A virus after being cooked?

1. Canned tuna
2. Broiled shrimp
3. Baked haddock
4. Steamed lobster

262. A client with hepatitis B asks the nurse, "Are there any medications to help me get rid of this problem?" Which is the **best** response by the nurse?

1. "Sedatives can be given to help you relax."
2. "We can give you immune serum globulin."
3. "Vitamin supplements are frequently helpful and hasten recovery."
4. "There are medications to help reduce viral load and liver inflammation."

263. A nurse is teaching a client about prophylactic measures that minimize the risk of contracting hepatitis B. Which actions should be included in this teaching plan? **Select all that apply.**

1. Preventing constipation
2. Screening of blood donors
3. Avoiding shellfish in the diet
4. Limiting hepatotoxic drug therapy
5. Maintaining a monogamous sexual relationship

264. A nurse is caring for a client who is positive for hepatitis A. What should the nurse do?

1. Wear a gown when entering the client's room.
2. Use caution when bringing in the client's food.
3. Use gloves when removing the client's bedpan.

4. Wear a protective mask when entering the client's room.

265. A client who is about to have a blood transfusion asks the nurse, "Which type of hepatitis is most frequently transmitted by transfusions?" The nurse should respond, "Although the risk is minimal, the type of hepatitis associated with blood transfusions is hepatitis:

1. A."
2. B."
3. C."
4. D."

266. A nurse instructs a client with viral hepatitis about the type of diet that should be ingested. Which lunch selected by the client indicates understanding about dietary principles associated with this diagnosis?

1. Turkey salad, French fries, sherbet
2. Cottage cheese, mixed fruit salad, milkshake
3. Salad, sliced chicken sandwich, gelatin dessert
4. Cheeseburger, tortilla chips, chocolate pudding

267. A nurse is reviewing discharge plans with a client who is hospitalized with hepatitis A. The nurse concludes that the client understands preventive measures to reduce the risk for spreading the disease when the client states, "I should:

1. wash my hands frequently."
2. launder my clothes separately."
3. put used tissues in the garbage."
4. wear a mask when leaving the house."

268. A nurse educator of a college health course is discussing tattoos with the class. Which type of hepatitis associated with tattoos should the nurse include in the teaching plan?

1. A
2. C
3. D
4. E

269. A client in a debilitated state is admitted for palliative treatment of cancer of the liver. Which objective information collected by the nurse is **most** helpful for future monitoring of the client's condition?

1. Diet history
2. Bowel sounds
3. Present weight
4. Pain description

270. A client with chronic hepatic failure is soon to be discharged from the hospital. Which diet should the nurse encourage the client to follow based on the health care provider's order?

1. High-fat
2. Low-calorie
3. Low-protein

#### 4. High-sodium

271. For which clinical indicator associated with a complication of portal hypertension should the nurse assess the client?

1. Liver abscess
2. Intestinal obstruction
3. Perforation of the duodenum
4. Hemorrhage from esophageal varices

272. A health care provider orders a gastrointestinal endoscopy with a capsule endoscopic device. What should the nurse instruct the client to do?

1. Check the recorder every hour.
2. Avoid eating food and fluid during the test.
3. Avoid stooping and bending during the test.
4. Swallow the capsule as soon as it is placed in the mouth.

273. A client is a candidate for intubation as a result of bleeding esophageal varices. Which type of tube should the nurse anticipate will **most** likely be used to meet the needs of this client?

1. Levin
2. Salem sump
3. Miller-Abbott
4. Blakemore-Sengstaken

274. A client with hepatic cirrhosis begins to develop slurred speech, confusion, drowsiness, and a flapping tremor. With this evidence of impending hepatic coma, which diet can the nurse expect will be ordered for this client?

1. 20 g of protein, 2000 calories
2. 70 g of protein, 1200 calories
3. 80 g of protein, 2500 calories
4. 100 g of protein, 1500 calories

▶275. A client eats a meal that contains 13 g of fat, 31 g of carbohydrates, and 5 g of protein. What is this client's total caloric intake for this meal? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ calories

276.▶ A client is admitted to the hospital with a diagnosis of cirrhosis of the liver. For which classic signs of hepatic coma should the nurse assess this client? **Select all that apply.**

1. Mental confusion
2. Increased cholesterol
3. Brown-colored stools
4. Flapping hand tremors
5. Hyperactive deep tendon reflexes

277. A nurse is concerned that a client with a diagnosis of cirrhosis of the liver may experience the complication of hepatic coma. For which clinical indicator should the nurse assess this client?

1. Icterus

2. Urticaria
3. Uremic frost
4. Hemangioma

278. A nurse is caring for a client with cirrhosis of the liver. Which laboratory test should the nurse monitor that, when abnormal, might identify a client who may benefit from neomycin enemas?

1. Ammonia level
2. Culture and sensitivity
3. White blood cell count
4. Alanine aminotransferase level

279. A client with cirrhosis of the liver has a prolonged prothrombin time and a low platelet count. A regular diet is ordered. What should the nurse instruct the client to do considering the client's condition?

1. Avoid foods high in vitamin K.
2. Check the pulse several times a day.
3. Drink a glass of milk when taking aspirin.
4. Report signs of bleeding no matter how slight.

280. A client is admitted with anorexia, weight loss, abdominal distention, and abnormal stools. A diagnosis of malabsorption syndrome is made. What nursing action should the nurse implement to **best** meet this client's needs?

1. Allow the client to eat food preferences.
2. Encourage the consumption of high-protein foods.
3. Institute IV therapy to improve the client's hydration.
4. Maintain NPO status because food precipitates diarrhea.

281. A client is diagnosed as having malabsorption syndrome secondary to celiac sprue. Which intervention should the nurse expect to precipitate a striking clinical improvement in the client?

1. Folic acid
2. Vitamin B<sub>12</sub>
3. Corticosteroids
4. Gluten-free diet

▶282. A client is diagnosed with malabsorption syndrome. Which foods should the nurse teach the client to avoid? **Select all that apply.**

1. Corn
2. Cheese
3. Oatmeal
4. Rye bread
5. Fruit juice

283. For which classic clinical finding should the nurse assess the stool of clients with malabsorption syndrome?

1. Melena
2. Frank blood
3. Fat globules

4. Currant jelly consistency

284. A nurse is admitting a client with the diagnosis of malabsorption syndrome to the medical unit at lunchtime. Which foods can be included on the client's ordered diet?

1. Breaded veal cutlet with cheese
2. Roast beef sandwich with pickles
3. Chicken noodle soup with crackers
4. Cheese omelet with chopped spinach

▶285. Which food selections by a client with malabsorption syndrome indicate that the nurse's dietary teaching was successful? **Select all that apply.**

1. Green beans
2. Baked potato
3. Noodle pudding
4. Turkey sandwich
5. Whole wheat cereal

286. An 18-year-old is admitted with an acute onset of right lower quadrant pain at McBurney's point. Appendicitis is suspected. For which clinical indicator should the nurse assess the client to determine if the pain is secondary to appendicitis?

1. Urinary retention
2. Gastric hyperacidity
3. Rebound tenderness
4. Increased lower bowel motility

▶287. A client who had surgery for a ruptured appendix develops peritonitis. What clinical findings related to peritonitis should the nurse expect the client to exhibit? **Select all that apply.**

1. Fever
2. Hyperactivity
3. Extreme hunger
4. Urinary retention
5. Abdominal muscle rigidity

288. A client had surgery for a perforated appendix with localized peritonitis. In which position should the nurse place this client?

1. Sims
2. Semi-Fowler
3. Trendelenburg
4. Dorsal recumbent

▶289. A nurse is assessing a client who has possible appendicitis. The nurse assesses the client for rebound tenderness. Place an X on the illustration where the client is expected to report pain.

290. A Harris flush is ordered to reduce a client's flatus after abdominal surgery. How many inches should the nurse insert the rectal catheter?

1. 2
2. 4
3. 6
4. 8

291. A client is diagnosed with Crohn disease, and parenteral vitamins are prescribed. The client asks why the vitamins have to be given IV rather than by mouth. What rationales for this route should the nurse include in a response to the question? **Select all that apply.**

1. More rapid action results.
2. They are ineffective orally.
3. They decrease colon irritability.
4. Intestinal absorption may be inadequate.
5. Allergic responses are less likely to occur.

292. After many years of coping with colitis, a client makes the decision to have a colectomy as advised by the health care provider. Which is **most** likely the significant factor that impacted on the client's decision?

1. It is temporary until the colon heals.
2. Surgical treatment cures ulcerative colitis.
3. Ulcerative colitis can progress to Crohn disease.
4. Without surgery, eating table foods is contraindicated.

293. A self-help group of clients with irritable bowel syndrome have invited a nurse to present a program on nutrition. Which substance should the nurse teach the clients to minimize in the diet to decrease GI irritability?

1. Cola drinks
2. Amino acids
3. Rice products
4. Sugar products

294. A client is diagnosed as having colitis. Which clinical findings should the nurse expect the client to report? **Select all that apply.**

1. Fever
2. Diarrhea
3. Gain in weight
4. Spitting up blood
5. Abdominal cramps

295. A nurse obtains daily stool specimens for a client with chronic bowel inflammation. The nurse concludes that these stool examinations were ordered to determine:

1. fat content.
2. occult blood.
3. ova and parasites.
4. culture and sensitivity.

▶296. When advising a college student about dietary choices, the nurse should consider the caloric value of the **most** commonly ordered fast foods eaten by active young adults. List the following foods in order from the one with the least number of calories to the one with the most number of calories.

1. \_\_\_\_\_ French fries
2. \_\_\_\_\_ Garden salad
3. \_\_\_\_\_ Whopper with cheese
4. \_\_\_\_\_ One slice of French toast
5. \_\_\_\_\_ Six pieces of chicken tenders

297. A nurse is evaluating a client who has been receiving medical intervention for the diagnosis of Crohn disease. Which expected outcome is **most** important for this client?

1. Does skin care
2. Takes oral fluids
3. Gains a half pound per week
4. Experiences less abdominal cramping

▶298. A nurse teaches a client with GI irritability to minimize the intake of dietary irritants. Which products did the nurse teach the client to avoid? **Select all that apply.**

1. Rice
2. Milk
3. Cheese
4. Table salt
5. Chocolate candy

299. A nurse is reviewing the laboratory results of and collecting a health history from a client with a diagnosis of colitis. Which common clinical manifestation of colitis should the nurse expect?

1. Weight loss
2. Hemoptysis
3. Increased red blood cells
4. Decreased white blood cells

300. A nurse is teaching a client with an acute exacerbation of colitis about the most appropriate diet. Which food selected by the client indicates that the dietary teaching is effective?

1. Orange juice
2. Scrambled eggs
3. Vanilla milkshake
4. Creamed potato soup

301. Which explanation is **most** accurate when the nurse teaches a client about intussusception of the bowel?

1. Kinking of the bowel onto itself
2. A band of connective tissue compressing the bowel
3. Telescoping of a proximal loop of bowel into a distal loop
4. A protrusion of an organ or part of an organ through the wall that contains it

302. What should the nurse do when caring for a client with an ileostomy?

1. Teach the client to eat foods high in residue.
2. Explain that drainage can be controlled with daily irrigations.
3. Expect the stoma to start draining on the third postoperative day.
4. Anticipate that any emotional stress can increase intestinal peristalsis.

303. A client had part of the ileum surgically removed. Why is it necessary for the nurse to monitor the client for clinical indicators of anemia?

1. Folic acid is absorbed in the ileum.
2. The hemopoietic factor is absorbed in the ileum.
3. Iron absorption is dependent on simultaneous bile salt absorption in the ileum.
4. The trace elements copper, cobalt, and nickel, required for hemoglobin synthesis, are absorbed in the ileum.

304. An active adolescent is admitted to the hospital for surgery for an ileostomy. When planning a teaching session about self-care, the nurse includes sports that should be avoided by a client with an ileostomy. Which should be included on the list of sports to be avoided? **Select all that apply.**

1. Football
2. Swimming
3. Ice hockey
4. Track events
5. Cross-country skiing

305. A client is scheduled for a colonoscopy, and the health care provider orders a tap water enema. In which position should the nurse place the client during the enema?

1. Left Sims
2. Back lying
3. Knee chest
4. Mid-Fowler

306. A nurse is educating a client with a colostomy of the ascending colon about using a colostomy appliance. Which instruction should the nurse provide to help prevent leakage of stool from the appliance?

1. Irrigate the colostomy to establish an expected pattern of elimination
2. Empty the appliance when it is approximately one half full with feces
3. Use an antiseptic to clean the peristomal skin before applying the appliance

4. Select an appliance with a pouch opening of at least 5 cm larger than the stoma
307. A nurse is caring for a client with a new colostomy. Which client outcome is **most** important for achievement of long-range goals associated with adjusting to a new colostomy?
1. Mastery of techniques of colostomy care
  2. Readiness to accept an altered body function
  3. Awareness of available community resources
  4. Knowledge of the necessary dietary modifications
308. Neomycin 1 g is prescribed preoperatively for a client with a diagnosis of cancer of the colon. The client asks why neomycin is being given. Which is the **best** response by the nurse?
1. "It will decrease your kidney function and lessen urine production during surgery."
  2. "It will kill the bacteria in your bowel and decrease the risk of infection after surgery."
  3. "It is used to alter the body flora, which reduces the spread of the tumor to adjacent organs."
  4. "It is used to prevent you from getting an infection, particularly a bladder infection, before surgery."
309. A client had a colon resection and formation of a colostomy 2 days ago. What color does the nurse expect the stoma to be when assessing its viability?
1. Pink
  2. Gray
  3. Brick red
  4. Dark purple
310. A nurse is caring for a client who is receiving total parenteral nutrition (TPN) after extensive colon surgery. The nurse concludes that the client understands teaching about the purpose of TPN when the client states, "TPN:
1. provides short-term nutrition after surgery."
  2. assists in providing supplemental nutrition."
  3. provides total nutrition when GI function is questionable."
  4. assists people who are unable to eat but have active GI function."
311. A female client with the diagnosis of Crohn disease tells the nurse that her boyfriend dates other women. She believes that this behavior causes an increase in her symptoms. What should the nurse do **first** when counseling this client?
1. Help the client explore attitudes about herself.
  2. Educate the client's boyfriend about her illness.
  3. Suggest the client should not see her boyfriend for a while.
  4. Schedule the client and her boyfriend for a counseling session.
312. A nurse is assessing two clients. One client has ulcerative colitis and the other client has Crohn disease. Which is more likely to be identified in the client with ulcerative colitis than the client with Crohn disease?
1. Inclusion of transmural involvement of the small bowel wall
  2. Correlation with increased malignancy because of malabsorption syndrome
  3. Pathology beginning proximally with intermittent plaques found along the colon

4. Involvement starting distally with rectal bleeding that spreads continuously up the colon
313. A client with ulcerative colitis has experienced frequent severe exacerbations over the past several years. The client is admitted to the hospital with intense pain, severe diarrhea, and cachexia. Which therapeutic course should the nurse expect the health care provider to explore with this client?
1. Intensive psychotherapy
  2. Continued medical therapy
  3. Surgical therapy (colectomy)
  4. Diet therapy (low-residue, high-protein diet)
314. A nurse is teaching a client who has a full-time job how to care for a new colostomy. At which time should the nurse suggest scheduling the colostomy irrigations?
1. When it is most convenient for the client
  2. Approximately a half hour after breakfast
  3. Halfway between the two largest meals of the day
  4. At the time the client had bowel movements before surgery
315. A nurse is teaching a client with a permanent colostomy about self-care in preparation for discharge from the hospital. Which intervention should the nurse discuss with the client?
1. Limiting activity
  2. Wearing special clothing
  3. Dilating the stoma periodically
  4. Maintaining a low-residue diet
316. A client with cancer of the colon had surgery for a resection of the tumor and the creation of a colostomy. During the 6-week postoperative checkup, the nurse teaches the client about nutrition. The nurse evaluates that learning has taken place when the client states, "I should follow a diet that is:
1. rich in protein."
  2. low in fiber content."
  3. as close to usual as possible."
  4. higher in calories than before."
317. A nurse is caring for a client with a nasointestinal tube. Which solution should the nurse use when instilling the tube to ensure its patency?
1. Sterile water
  2. Isotonic saline
  3. Hypotonic saline
  4. Hypertonic glucose
318. After having a transverse colostomy, the client asks what physical effect the surgery will have on future sexual relationships. Which information should the nurse include in a teaching plan for this client?
1. "You will be able to resume usual sexual relationships."
  2. "Surgery will temporarily decrease your sexual impulses."
  3. "Your sexual activity must be curtailed for several weeks."

4. "Partners should be told about the surgery before any sexual activity."
319. A client has a transverse loop colostomy. What should the nurse do when inserting a catheter for the colostomy irrigation?
1. Use an oil-based lubricant.
  2. Instruct the client to bear down.
  3. Apply gentle but continuous pressure.
  4. Direct it toward the client's right side.
320. During a colostomy irrigation, a client reports feeling abdominal cramps. What should the nurse do in response to the client's statement?
1. Discontinue the irrigation.
  2. Lower the container of fluid.
  3. Clamp the catheter for a few minutes.
  4. Advance the catheter approximately an inch.
321. How many inches should the nurse insert a catheter into the stoma when performing a transverse colostomy irrigation?
1. 5 cm (2 inches)
  2. 8 cm (3 inches)
  3. 15 cm (6 inches)
  4. 20 cm (8 inches)
322. When teaching irrigation of a colostomy, how many inches above the stoma should the nurse teach the client to place the container?
1. 15 cm (6 inches)
  2. 25 cm (10 inches)
  3. 30 cm (12 inches)
  4. 45 cm (18 inches)
323. A client is diagnosed with cancer of the rectum and has surgery for an abdominoperineal resection and colostomy. Which nursing care should be implemented during the postoperative period?
1. Limiting fluid intake for several days
  2. Withholding fluids for seventy-two hours
  3. Having the client change the colostomy bag
  4. Keeping the client's skin around the stoma clean
324. Before discharge, a client who had a colostomy for colorectal cancer questions the nurse about resuming activity. What should the nurse teach the client about activity?
1. "With guidance, a near-normal lifestyle, including complete sexual function, is possible."
  2. "Activities of daily living should be resumed as quickly as possible so you avoid being depressed."
  3. "Most sports activities, except for swimming, can be resumed based on your overall physical condition."
  4. "After surgery, changes in activities must be made to accommodate for the physiologic changes caused by the operation."
325. Which statement by an older adult **most** strongly supports the nurse's conclusion

that the client is impacted with stool?

1. "I have a lot of gas pains."
2. "I don't have much of an appetite."
3. "I feel like I have to go and just can't."
4. "I haven't had a bowel movement for several days."

326. Which clinical indicators identified by the nurse support the probable presence of a fecal impaction in a client? **Select all that apply.**

1. Abdominal cramps
2. Fecal liquid seepage
3. Hyperactive bowel sounds
4. Bright red blood in the stool
5. Decreased number of bowel movements

327. An older adult client who is accustomed to taking enemas periodically to avoid constipation is admitted to a long-term care facility. In addition to medications, the health care provider prescribes bed rest and a regular diet. Which action should be implemented to help prevent the client from developing constipation?

1. Arrange to have enemas ordered for the client.
2. Obtain a prescription for a daily laxative for the client.
3. Place a commode by the bedside to facilitate defecation.
4. Offer a large glass of prune juice with warm water each morning.

328. A client is experiencing chronic constipation and the nurse discusses how to include more bulk in the diet. The nurse concludes that learning has occurred when the client states, "Bulk in the diet promotes defecation by:

1. irritating the bowel wall."
2. stimulating the intestinal mucosa chemically."
3. acting on the microorganisms in the large intestine."
4. stretching intestinal smooth muscle, which causes it to contract."

329. A client is scheduled for ligation of hemorrhoids. Which diet does the nurse expect to be ordered in preparation for this surgery?

1. Bland
2. Clear liquid
3. High-protein
4. Low-residue

330. A nurse is assessing a client with the diagnosis of hemorrhoids. Which factors in the client's history probably played a role in the development of the client's hemorrhoids? **Select all that apply.**

1. Constipation
2. Hypertension
3. Eating spicy foods
4. Bowel incontinence
5. Numerous pregnancies

331. A client has a diagnosis of hemorrhoids. Which signs and symptoms does the nurse expect the client to report? **Select all that apply.**

1. Flatulence
2. Anal itching
3. Blood in stool
4. Rectal pressure
5. Pain when defecating

332. Which interventions should the nurse anticipate will be ordered **initially** for a client who had a hemorrhoidectomy? **Select all that apply.**

1. Giving an enema
2. Applying moist heat
3. Administering stool softeners
4. Encouraging showers as needed
5. Providing occlusive dressings to the area

333. A client is diagnosed as having the hepatitis B virus (HBV). The nurse reviews the client's health history for possible situations in which exposure may have occurred. Which event does the nurse determine is the **most** likely source of this infection?

1. Had a small tattoo on the arm 3 months ago
2. Assisted in the emergency birth of a baby 2 weeks ago
3. Worked for a month in an undeveloped area in Mexico 4 months ago
4. Attended an ecologic conference in a large urban center 2 months ago

334. A client who is receiving TPN reports experiencing nausea, thirst, and a headache. Which clinical factor should the nurse monitor **initially** to further assess the client's status?

1. Blood glucose
2. Urinary output
3. Blood pressure
4. Oral temperature

335. A low-residue diet is recommended for a client. Which food should the nurse encourage the client to select from a menu?

1. Steamed broccoli
2. Creamed potatoes
3. Raw spinach salad
4. Baked sweet potato

336. A client has severe diarrhea, and the health care provider prescribes intravenous fluids, sodium bicarbonate, and an antidiarrheal medication. Which **most** frequently ordered antidiarrheal drug does the nurse expect the health care provider to prescribe?

1. Bisacodyl (Dulcolax)
2. Psyllium (Metamucil)
3. Loperamide (Imodium)
4. Docusate sodium (Colace)

# Endocrine System

337. A nurse is assessing a client with a diagnosis of diabetes insipidus. For which signs indicative of diabetes insipidus should the nurse assess the client? **Select all that apply.**
1. Excessive thirst
  2. Increased blood glucose
  3. Dry mucous membranes
  4. Increased blood pressure
  5. Decreased serum osmolarity
  6. Decreased urine specific gravity
338. A client is admitted with a head injury. The nurse identifies that the client's urinary retention catheter is draining large amounts of clear, colorless urine. What does the nurse identify as the **most** likely cause?
1. Increased serum glucose
  2. Deficient renal perfusion
  3. Inadequate ADH secretion
  4. Excess amounts of IV fluid
339. After a head injury a client develops a deficiency of antidiuretic hormone (ADH). What should the nurse consider about the response to secretion of ADH before assessing this client?
1. Serum osmolarity increases
  2. Urine concentration decreases
  3. Glomerular filtration decreases
  4. Tubular reabsorption of water increases
340. After surgical clipping of a cerebral aneurysm, the client develops the syndrome of inappropriate secretion of antidiuretic hormone. For which manifestations of excessive levels of antidiuretic hormone (ADH) should the nurse assess the client? **Select all that apply.**
1. Polyuria
  2. Weight gain
  3. Hypotension
  4. Hyponatremia
  5. Decreased specific gravity
341. A client who has acromegaly and insulin-dependent diabetes undergoes a hypophysectomy. The nurse identifies that further teaching about the hypophysectomy is necessary when the client states, "I know I will:
1. be sterile for the rest of my life."
  2. require larger doses of insulin than I did preoperatively."
  3. have to take cortisone or a similar drug for the rest of my life."
  4. have to take thyroxine or a similar medication for the rest of my life."
342. A nurse is caring for a client who had a hypophysectomy. For which complication specific to this surgery should the nurse assess the client for early clinical manifestations?

1. Urinary retention
2. Respiratory distress
3. Bleeding at the suture line
4. Increased intracranial pressure

343. Which information from the client's history does the nurse identify as a risk factor for developing osteoporosis?

1. Receives long-term steroid therapy
2. Has a history of hypoparathyroidism
3. Engages in strenuous physical activity
4. Consumes high doses of the hormone estrogen

344. A nurse is caring for two clients newly diagnosed with diabetes. One client has type 1 diabetes and the other client has type 2 diabetes. The nurse determines that the main difference between newly diagnosed type 1 and type 2 diabetes is that in type 1 diabetes:

1. onset of the disease is slow.
2. excessive weight is a contributing factor.
3. complications are not present at the time of diagnosis.
4. treatment involves diet, exercise, and oral medications.

345. A client is scheduled for an adrenalectomy. Which nursing intervention should the nurse anticipate will be ordered for this client?

1. Administer IV steroids.
2. Provide a high-protein diet.
3. Collect a 24-hour urine specimen.
4. Withhold all medications for 48 hours.

346. A nurse is caring for a newly admitted client with a diagnosis of Cushing syndrome. Why should the nurse monitor this client for clinical indicators of diabetes mellitus?

1. Cortical hormones stimulate rapid weight loss.
2. Tissue catabolism results in a negative nitrogen balance.
3. Glucocorticoids accelerate the process of gluconeogenesis.
4. Excessive adrenocorticotrophic hormone secretion damages pancreatic tissue.

347. A nurse is caring for a client with a diagnosis of Cushing syndrome. What is the **most** common cause of Cushing syndrome that the nurse should consider before assessing this client for physiological responses?

1. Pituitary hypoplasia
2. Hyperplasia of the adrenal cortex
3. Deprivation of adrenocortical hormones
4. Insufficient adrenocorticotrophic hormone production

348. A nurse is assessing a female client with Cushing syndrome. Which clinical findings can the nurse expect to identify? **Select all that apply.**

1. Hirsutism
2. Menorrhagia
3. Buffalo hump
4. Dependent edema
5. Migraine headaches

349. Which clinical indicators can the nurse expect when assessing a client with Cushing syndrome? **Select all that apply.**

1. Lability of mood
2. Slow wound healing
3. A decrease in the growth of hair
4. Ectomorphism with a moon face
5. An increased resistance to bruising

350. A nurse is caring for a male client with a diagnosis of Cushing syndrome. Which clinical manifestations does the nurse expect to identify? **Select all that apply.**

1. Polyuria
2. Obese trunk
3. Hypotension
4. Sleep disturbance
5. Thin arms and legs

351. A client is diagnosed with Cushing syndrome. Which clinical manifestation does the nurse expect to increase in a client with Cushing syndrome?

1. Urine output
2. Glucose level
3. Serum potassium
4. Immune response

352. What should the nurse do when collecting a 24-hour urine specimen?

1. Check to verify if a preservative is needed.
2. Weigh the client before starting the collection.
3. Discard the last voided specimen of the 24-hour period.
4. Assess the client's intake and output for the previous 24-hour period.

353. A client is scheduled for a bilateral adrenalectomy. Before surgery, steroids are administered to the client. What does the nurse determine is the reason for the steroids?

1. Foster accumulation of glycogen in the liver
2. Increase the inflammatory action to promote scar formation
3. Facilitate urinary excretion of salt and water following surgery
4. Compensate for sudden lack of these hormones following surgery

354. A nurse is caring for a client who is scheduled for a bilateral adrenalectomy. Which medication should the nurse expect to be prescribed for this client on the day of surgery and in the immediate postoperative period?

1. Methimazole (Tapazole)
2. Pituitary extract (Pituitrin)
3. Regular insulin (Novolin R)
4. Hydrocortisone succinate (Solu-Cortef)

355. A nurse is caring for a client who had an adrenalectomy. For what clinical response should the nurse monitor while steroid therapy is being regulated?

1. Hypotension
2. Hyperglycemia
3. Sodium retention

4. Potassium excretion

356. A client who has just had an adrenalectomy is told about a death in the family and becomes very upset. What concern about the client requires the nurse to notify the health care provider?

1. Analgesia and mild sedation will be required to ensure rest.
2. Steroid replacement medication therapy will have to be reduced.
3. There is a decreased ability to handle stress despite steroid therapy.
4. Feelings of exhaustion and lethargy may result from the emotional stress.

357. A client with a tentative diagnosis of Cushing syndrome has an increased cortisol level. For what response should the nurse assess this client?

1. Hypovolemia
2. Hyperkalemia
3. Hypoglycemia
4. Hypernatremia

358. A health care provider orders a low-sodium, high-potassium diet for a client with Cushing syndrome. Which explanation should the nurse provide as to why the client needs to follow this diet?

1. "The use of salt probably contributed to the disease."
2. "Excess weight will be gained if sodium is not limited."
3. "The loss of excess sodium and potassium in the urine requires less renal stimulation."
4. "Excessive aldosterone and cortisone cause retention of sodium and loss of potassium."

359. A nurse is caring for a client with the clinical manifestation of hypotension associated with a diagnosis of Addison disease. Which hormone is impaired in its production as a result of this disease?

1. Estrogens
2. Androgens
3. Glucocorticoids
4. Mineralocorticoids

360. A nurse is monitoring for clinical manifestations of infection in a client with a diagnosis of Addison disease. Which body mechanism related to infectious processes does the nurse conclude is impaired as a result of this disease?

1. Stress response
2. Electrolyte balance
3. Metabolic processes
4. Respiratory function

361. A client is admitted to a medical unit with a diagnosis of Addison disease. The client is emaciated and reports muscular weakness and fatigue. Which disturbed body process does the nurse determine is the root cause of the client's clinical manifestations?

1. Fluid balance
2. Electrolyte levels
3. Protein anabolism
4. Masculinizing hormones

362. Which is an important intervention that the nurse should include in the plan of care that is specific for a client with Addison disease?

1. Encouraging the client to exercise
2. Protecting the client from exertion
3. Restricting the client's fluid intake
4. Monitoring the client for hypokalemia

363. A health care provider writes orders addressing the needs of a client with Addison disease. Which outcome does the nurse conclude is the main focus of treatment for this client?

1. Decrease in eosinophils
2. Increase in lymphoid tissue
3. Restoration of electrolyte balance
4. Improvement of carbohydrate metabolism

364. A nurse is caring for a client with Addison disease. Which information should the nurse include in a teaching plan as a means of encouraging this client to modify dietary intake?

1. Increased amounts of potassium are needed to replace renal losses.
2. Increased protein is needed to heal the adrenal tissue and thus cure the disease.
3. Supplemental vitamins are needed to supply energy and assist in regaining the lost weight.
4. Extra salt is needed to replace the amount being lost due to lack of sufficient aldosterone to conserve sodium.

365. Fludrocortisone (Florinef) is prescribed for a client with adrenal insufficiency. Which responses to the medication should the nurse teach the client to report? **Select all that apply.**

1. Edema
2. Rapid weight gain
3. Fatigue in the afternoon
4. Unpredictable changes in mood
5. Increased frequency of urination

366. After assessing a client, a nurse concludes that the client may be experiencing hyperglycemia. Which clinical findings commonly associated with hyperglycemia support the nurse's conclusion? **Select all that apply.**

1. Polyuria
2. Polydipsia
3. Polyphagia
4. Polyphrasia
5. Polydysplasia

367. A nurse is monitoring a client's laboratory results for a fasting plasma glucose level. Within which range of a fasting plasma glucose level does the nurse conclude that a client is considered to be diabetic?

1. 40 and 60 mg/dL
2. 80 and 99 mg/dL

3. 100 and 125 mg/dL

4. 126 and 140 mg/dL

368. Which nursing intervention is the **priority** when a client is first admitted with hyperglycemic hyperosmolar nonketotic syndrome (HHNS)?

1. Providing oxygen

2. Encouraging carbohydrates

3. Administering fluid replacement

4. Teaching facts about dietary principles

369. A client admitted to the emergency department has ketones in the blood and urine. Which situation associated with this physiologic finding should be the nurse's focus when collecting additional data about this client?

1. Starvation

2. Alcoholism

3. Bone healing

4. Positive nitrogen balance

370. A client tells the nurse during the admission history that an oral hypoglycemic agent is taken daily. For which condition does the nurse conclude that an oral hypoglycemic agent may be prescribed by the health care provider?

1. Ketosis

2. Obesity

3. Type 1 diabetes

4. Reduced insulin production

371. A nurse is assessing a client with a diagnosis of hypoglycemia. What clinical manifestations support this diagnosis? **Select all that apply.**

1. Thirst

2. Palpitations

3. Diaphoresis

4. Slurred speech

5. Hyperventilation

372. A nurse is caring for a client with a diagnosis of type 1 diabetes who has developed diabetic coma. Which element excessively accumulates in the blood to precipitate the signs and symptoms associated with this condition?

1. Sodium bicarbonate, causing alkalosis

2. Ketones as a result of rapid fat breakdown, causing acidosis

3. Nitrogen from protein catabolism, causing ammonia intoxication

4. Glucose from rapid carbohydrate metabolism, causing drowsiness

373. A nurse is caring for a postoperative client who has diabetes. Which is the **most** common cause of diabetic ketoacidosis that the nurse needs to consider when caring for this client?

1. Emotional stress

2. Presence of infection

3. Increased insulin dose

4. Inadequate food intake

374. A client is admitted to the hospital with a diagnosis of diabetic ketoacidosis. What is the **initial** intervention that the nurse should expect the health care provider to prescribe for this client?

1. IV fluids
2. Potassium
3. NPH insulin (Novolin N)
4. Sodium polystyrene sulfonate (Kayexalate)

375. A client is diagnosed with diabetic ketoacidosis. Which insulin should the nurse expect the health care provider to prescribe?

1. Insulin lispro (Humalog)
2. Insulin glargine (Lantus)
3. NPH insulin (Novolin N)
4. Regular insulin (Novolin R)

376. Metformin (Glucophage) 2 g by mouth is prescribed for a client with type 2 diabetes. Each tablet contains 500 mg. How many tablets should the nurse administer?

**Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

377. A nurse is assessing a client experiencing a diabetic coma. What unique response associated with diabetic coma that is not exhibited with hyperglycemic hyperosmolar nonketotic syndrome (HHNS) should the nurse identify when assessing this client?

1. Fluid loss
2. Glycosuria
3. Kussmaul respirations
4. Increased blood glucose level

378. A client with untreated type 1 diabetes mellitus may lapse into a coma because of acidosis. An increase in which component in the blood is a direct cause of this type of acidosis?

1. Ketones
2. Glucose
3. Lactic acid
4. Glutamic acid

379. A client is learning alternate site testing (AST) for glucose monitoring. Which client statement indicates to the nurse that additional teaching is necessary?

1. "I need to rub my forearm vigorously until warm before testing at this site."
2. "The fingertip is preferred for glucose monitoring if hyperglycemia is suspected."
3. "Alternate site testing is unsafe if I am experiencing a rapid change in glucose levels."
4. "I have to make sure that my current glucose monitor can be used at an alternative site."

380. A client with diabetes asks the nurse whether the new forearm stick glucose monitor gives the same results as a fingerstick. What is the nurse's **best** response to this question?

1. "There is no difference between readings."
2. "These types of monitors are meant for children."

3. "Readings are on a different scale for each monitor."

4. "Faster readings can be obtained from a fingerstick."

381. A urine specimen is needed to test for the presence of ketones in a client who is diabetic. What should the nurse do when collecting this specimen from a urinary retention catheter?

1. Disconnect the catheter and drain the urine into a clean container.

2. Clean the drainage valve and remove the urine from the catheter bag.

3. Wipe the catheter with alcohol and drain the urine into a sterile test tube.

4. Clamp the catheter, cleanse the port, and use a sterile syringe to remove urine.

382. A nurse is monitoring a client's fasting plasma glucose (FPG) level. At which FPG level should the nurse identify that the client has prediabetes?

1. 70 mg/dL

2. 100 mg/dL

3. 130 mg/dL

4. 160 mg/dL

383. A nurse concludes that a client has a hypoglycemic reaction to insulin. Which clinical findings support this conclusion? **Select all that apply.**

1. Irritability

2. Glycosuria

3. Dry, hot skin

4. Heart palpitations

5. Fruity odor of breath

384. A nurse is planning to teach facts about hyperglycemia to a client with the diagnosis of diabetes. What information should the nurse include in the discussion about what causes diabetic acidosis?

1. Breakdown of fat stores for energy

2. Ingestion of too many highly acidic foods

3. Excessive secretion of endogenous insulin

4. Increased amounts of cholesterol in the extracellular compartment

385. A nurse is collecting information about a client who has type 1 diabetes and who is being admitted because of diabetic ketoacidotic coma. Which factors can predispose a client to this condition? **Select all that apply.**

1. Taking too much insulin

2. Getting too much exercise

3. Excessive emotional stress

4. Running a fever with the flu

5. Eating fewer calories than prescribed

386. A nurse is caring for a client admitted to the hospital for diabetic ketoacidosis. Which clinical findings related to this event should the nurse document in the client's clinical record? **Select all that apply.**

1. Sweating

2. Retinopathy

3. Acetone breath

- 4. Increased arterial bicarbonate level
- 5. Decreased arterial carbon dioxide level

387. A nurse is assessing a client with diabetic ketoacidosis. Which clinical manifestations should the nurse expect? **Select all that apply.**

- 1. Dry skin
- 2. Abdominal pain
- 3. Kussmaul respirations
- 4. Absence of ketones in the urine
- 5. Blood glucose level of less than 100 mg/dL

388. A nurse is caring for a client with diabetes who is scheduled for a radiographic study requiring contrast. Which should the nurse expect the health care provider to prescribe?

- 1. Acetylcysteine (Acetadote) before the test
- 2. Renal-friendly contrast medium for the test
- 3. Forced diuresis with mannitol (Osmitol) after the test
- 4. Hydration with dextrose and water throughout the test

389. A nurse is caring for a client with type 1 diabetes, and the health care provider prescribes one tube of glucose gel. What is the **primary** reason for the administration of glucose gel to this client?

- 1. Diabetic acidosis
- 2. Hyperinsulin secretion
- 3. Insulin-induced hypoglycemia
- 4. Idiosyncratic reactions to insulin

390. A client's blood gases reflect diabetic ketoacidosis. Which clinical indicator should the nurse expect to identify when monitoring this client's laboratory values?

- 1. Increased pH
- 2. Decreased  $PO_2$
- 3. Increased  $PCO_2$
- 4. Decreased  $HCO_3$

391. A nurse is caring for a client newly diagnosed with type 1 diabetes. When the health care provider tries to regulate this client's insulin regimen, the client experiences episodes of hypoglycemia and hyperglycemia and 15 g of a simple sugar is prescribed. What is the reason this is administered when a client experiences hypoglycemia?

- 1. Inhibits glycogenesis
- 2. Stimulates release of insulin
- 3. Increases blood glucose levels
- 4. Provides more storage of glucose

392. A nurse administers the prescribed regular insulin (Novolin R) to a client in diabetic ketoacidosis. In addition, the nurse anticipates that the IV solution prescribed will contain potassium to replenish potassium ions in the extracellular fluid that are being:

- 1. rapidly lost from the body by copious diaphoresis present during coma.
- 2. carried with glucose to the kidneys to be excreted in the urine in increased amounts.
- 3. quickly used up during the rapid series of catabolic reactions stimulated by insulin and glucose.

4. moved into the intracellular fluid compartment because of the generalized anabolism induced by insulin and glucose.

393. A client has a hypoglycemic reaction to insulin. Which client responses should the nurse document as clinical manifestations of hypoglycemia? **Select all that apply.**

1. Pallor
2. Tremors
3. Glycosuria
4. Acetonuria
5. Diaphoresis

394. A nurse identifies that the client is experiencing a hypoglycemic reaction. Which nursing intervention should the nurse implement to relieve the symptoms associated with this reaction?

1. Giving 4 oz of fruit juice
2. Administering 5% dextrose solution IV
3. Withholding a subsequent dose of insulin
4. Providing a snack of cheese and dry crackers

395. A nurse working in the diabetes clinic is evaluating a client's success with managing the medical regimen. Which is the **best** indication that a client with type 1 diabetes is successfully managing the disease?

1. Reduction in excess body weight
2. Stabilization of the serum glucose
3. Demonstrated knowledge of the disease
4. Adherence to the prescription for insulin

396. A client with type 1 diabetes mellitus has a fingerstick glucose level of 258 mg/dL at bedtime. A prescription for sliding scale regular insulin (Novolin R) exists. What should the nurse do?

1. Call the health care provider.
2. Encourage the intake of fluids.
3. Administer the insulin as prescribed.
4. Give the client a half cup of orange juice.

397. A client with diabetes is given instructions about foot care. The nurse determines that the instructions are understood when the client states, "I will:

1. cut my toenails before bathing."
2. soak my feet daily for one hour."
3. examine my feet using a mirror at least once a week."
4. break in my new shoes over the course of several weeks."

398. The nurse identifies that the dietary teaching provided for a client with diabetes is understood when the client states, "My diet:

1. should be rigidly controlled to avoid emergencies."
2. can be planned around a wide variety of commonly used foods."
3. is based on nutritional requirements that are the same for all people."
4. must not include eating any combination dishes and processed foods."

399. A health care provider prescribes 36 units of NPH insulin (Novolin N) and 12 units

of regular insulin (Novolin R). The nurse plans to administer these drugs in one syringe. Identify the steps in this procedure by listing the numbers by each picture next to the step below in **priority** order. (Start with the number of the picture that represents the first step and end with the number by the picture that represents the last step.)

Step 1 \_\_\_\_\_ Step 2 \_\_\_\_\_ Step 3 \_\_\_\_\_ Step 4 \_\_\_\_\_

1. Inject air equal to NPH dose into NPH vial.

2. Invert regular insulin bottle and withdraw regular insulin dose.

3. Inject air equal to regular dose into regular vial.

4. Invert NPH vial and withdraw NPH dose.

400. A nurse is caring for several clients with type 1 diabetes, and they each have a prescription for a specific type of insulin. Which insulin does the nurse conclude has the fastest onset of action?

1. Insulin lispro (Humalog)
2. Insulin glargine (Lantus)
3. NPH insulin (Novolin N)
4. Regular insulin (Novolin R)

401. A client with diabetes states, "I cannot eat big meals; I prefer to snack throughout the day." What information should the nurse include in a response to this client's statement?

1. Regulated food intake is basic to control.
2. Salt and sugar restriction is the main concern.
3. Small, frequent meals are better for digestion.
4. Large meals can contribute to a weight problem.

402. A nurse plans an evening snack of milk, crackers, and cheese for a client who is receiving NPH insulin (Novolin N). What does this snack provide?

1. Encouragement to stay on the diet

2. Added calories to promote weight gain
  3. Nourishment to counteract late insulin activity
  4. High-carbohydrate nourishment for immediate use
403. A client has a glycosylated hemoglobin measurement of 6%. What should the nurse conclude about this client when planning a teaching plan based on the results of this laboratory test?
1. Is experiencing a rebound hyperglycemia
  2. Needs the insulin changed to a different type
  3. Has followed the treatment plan as prescribed
  4. Requires further teaching regarding nutritional guide-lines
404. A client with type 1 diabetes comes to the clinic because of concerns regarding erratic control of blood glucose with the prescribed insulin therapy. The client has been experiencing a sudden fall in the blood glucose level, followed by a sudden episode of hyperglycemia. Which complication of insulin therapy should the nurse conclude that the client is experiencing?
1. Somogyi effect
  2. Dawn phenomenon
  3. Diabetic ketoacidosis
  4. Hyperosmolar nonketotic syndrome
405. A nurse is formulating a teaching plan for a client recently diagnosed with type 2 diabetes. What interventions should the nurse include that will decrease the risk of complications? **Select all that apply.**
1. Examining the feet daily
  2. Wearing well-fitting shoes
  3. Performing regular exercise
  4. Powdering the feet after showering
  5. Visiting the health care provider weekly
  6. Testing bathwater with the toes before bathing
406. Which is an independent nursing action that should be included in the plan of care for a client after an episode of ketoacidosis?
1. Monitoring for signs of hypoglycemia as a result of treatment
  2. Withholding glucose in any form until the situation is corrected
  3. Giving fruit juices, broth, and milk as soon as the client is able to take fluids orally
  4. Regulating insulin dosage according to the amount of ketones found in the client's urine
407. A client with type 1 diabetes has an above-the-knee amputation because of severe lower extremity arterial disease. What is the nurse's **primary** responsibility 2 days after surgery when preparing the client to eat dinner?
1. Checking the client's serum glucose level
  2. Assisting the client out of bed into a chair
  3. Placing the client in the high-Fowler position
  4. Ensuring the client's residual limb is elevated
408. A client with diabetes is being taught to self-administer a subcutaneous injection of

insulin. Identify the preferred site for the self-administration of this drug.

1. A
2. B
3. C
4. D

409. A nurse is caring for a client who is experiencing an underproduction of thyroxine. Which client response is associated with an underproduction of thyroxine ( $T_4$ )?

1. Myxedema
2. Acromegaly
3. Graves disease
4. Cushing disease

410. Propylthiouracil (PTU) is prescribed for a client diagnosed with hyperthyroidism. The client asks the nurse, "Why do I have to take this medication if I am going to get the atomic cocktail?" The nurse explains that the medication is being prescribed because it decreases the:

1. vascularity of the thyroid gland.
2. production of thyroid hormones.
3. need for thyroid iodine supplements.
4. amount of already formed thyroid hormones.

411. A nurse is caring for a client with an underactive thyroid gland. Which responses should the nurse expect the client to exhibit as a result of decreased levels of triiodothyronine ( $T_3$ ) and  $T_4$ ? **Select all that apply.**

1. Irritability
2. Tachycardia
3. Weight gain
4. Cold intolerance
5. Profuse diaphoresis

412. Which clinical findings should the nurse expect when assessing a client with

hyperthyroidism? **Select all that apply.**

1. Diarrhea
2. Listlessness
3. Weight loss
4. Bradycardia
5. Decreased appetite

413. A nurse is caring for a client after radioactive iodine is administered for Graves disease. What information about the client's condition after this therapy should the nurse consider when providing care?

1. Not radioactive and can be handled as any other individual
2. Highly radioactive and should be isolated as much as possible
3. Mildly radioactive but should be treated with routine safety precautions
4. Not radioactive but may still transmit some dangerous radiations and must be treated with precautions

414. A client is scheduled to have a thyroidectomy. Which medication does the nurse anticipate the health care provider will prescribe to decrease the size and vascularity of the thyroid gland before surgery?

1. Vasopressin (Pitressin)
2. Propylthiouracil (PTU)
3. Potassium iodide (SSKI)
4. Levothyroxine (Synthroid)

415. A nurse is assessing a client for possible laryngeal nerve injury following a thyroidectomy. Which action should the nurse implement on an hourly basis?

1. Ask the client to speak.
2. Instruct the client to swallow.
3. Have the client hum a familiar tune.
4. Swab the client's throat to test the gag reflex.

416. A client with hyperthyroidism asks the nurse about the tests that will be ordered. Which diagnostic tests should the nurse include in a discussion with this client?

1.  $T_4$  and x-ray films
2. TSH assay and  $T_3$
3. Thyroglobulin level and  $PO_2$
4. Protein-bound iodine and SMA

417. A nurse is caring for a newly admitted client with a diagnosis of Graves disease. In preparing a teaching plan, the nurse anticipates which diet will be ordered for this client?

1. High-calorie diet
2. Low-sodium diet
3. High-roughage diet
4. Mechanical-soft diet

418. A nurse in the postanesthesia care unit is caring for a client who just had a thyroidectomy. For which client response is it most important for the nurse to monitor?

1. Urinary retention
2. Signs of restlessness

3. Decreased blood pressure

4. Signs of respiratory obstruction

419. A nurse is caring for a client who just had a thyroidectomy. For which client response should the nurse assess the client when concerned about an accidental removal of the parathyroid glands during surgery?

1. Tetany

2. Myxedema

3. Hypovolemic shock

4. Adrenocortical stimulation

420. When taking the blood pressure of a client who had a thyroidectomy, the nurse identifies that the client is pale and has spasms of the hand. The nurse notifies the health care provider. Which should the nurse expect the health care provider to prescribe?

1. Calcium

2. Magnesium

3. Bicarbonate

4. Potassium chloride

421. What should a nurse do immediately when a client returns from the postanesthesia care unit following a subtotal thyroidectomy?

1. Inspect the incision.

2. Instruct the client not to speak.

3. Place a tracheostomy set at the bedside.

4. Place in the supine position for twenty-four hours.

422. On the first postoperative day following a thyroidectomy, a client tolerates a full-fluid diet. This is changed to a soft diet on the second postoperative day. The client reports having a sore throat when swallowing. What should the nurse do **first**?

1. Reorder the full-fluid diet.

2. Notify the health care provider.

3. Administer analgesics as prescribed before meals.

4. Provide saline gargles to moisten the mucous membranes.

423. A nurse is assessing a client with a diagnosis of hypothyroidism. Which clinical manifestations should the nurse expect when assessing this client? **Select all that apply.**

1. Dry skin

2. Brittle hair

3. Weight loss

4. Resting tremors

5. Heat intolerance

424. Levothyroxine (Synthroid) 0.125 mg by mouth is prescribed for a client with hypothyroidism. The only tablets available contain 25 mcg per tablet. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

425. A client is diagnosed with hyperthyroidism and is experiencing exophthalmia. Which measures should the nurse include when teaching this client how to manage the discomfort associated with exophthalmia? **Select all that apply.**

1. Use tinted glasses.
2. Use warm, moist compresses.
3. Elevate the head of the bed 45 degrees.
4. Tape eyelids shut at night if they do not close.
5. Apply a petroleum-based jelly along the lower eyelid.

426. For which client response should the nurse monitor when assessing for complications of hyperparathyroidism?

1. Tetany
2. Seizures
3. Bone pain
4. Graves disease

427. A nurse is caring for a client who is admitted to the hospital with the diagnosis of primary hyperparathyroidism. Which action should be included in this client's plan of care?

1. Ensuring a large fluid intake
2. Providing a high-calcium diet
3. Instituting seizure precautions
4. Encouraging complete bed rest

428. A client's laboratory values demonstrate an increased serum calcium level, and further diagnostic tests reveal hyperparathyroidism. For what clinical manifestations should the nurse assess this client? **Select all that apply.**

1. Muscle tremors
2. Abdominal cramps
3. Increased peristalsis
4. Cardiac dysrhythmias
5. Hypoactive bowel sounds

429. A nurse is caring for a client newly admitted with a diagnosis of pheochromocytoma. Which clinical findings does the nurse expect when assessing this client? **Select all that apply.**

1. Headache
2. Palpitations
3. Diaphoresis
4. Bradycardia
5. Hypotension

430. A nurse is transferring a client with a diagnosis of pheochromocytoma from a bed to a chair. What is the **most** important nursing intervention associated with this procedure for this client?

1. Supporting the client on the weak side
2. Ensuring that the chair is close to the client's bed
3. Placing sturdy shoes with rubber soles on the client's feet
4. Having the client sit on the side of the bed for a few minutes before the transfer

431. A nurse is caring for a client with a tentative diagnosis of pheochromocytoma who is receiving chlorpromazine (Thorazine). A 24-hour urine specimen to assess the

presence of vanillylmandelic acid (VMA) is ordered to assist in the confirmation of the diagnosis. What information should the nurse include in the client teaching regarding this test? **Select all that apply.**

1. The client may take chlorpromazine (Thorazine) during the test.
2. Encourage the client to engage in usual activities during the test.
3. Only salicylates (aspirin) can be taken for discomfort during the test.
4. All urine excreted over the 24-hour period must be saved and refrigerated.
5. Avoid coffee, chocolate, and citrus fruit for 3 days before and during the test.

432. A 24-hour urine test is ordered for a client who has a tentative diagnosis of pheochromocytoma. What should the nurse do?

1. Start the time of the test after discarding the first voiding.
2. Discard the last voiding in the 24-hour time period for the test.
3. Insert a urinary retention catheter to promote the collection of urine.
4. Strain the urine following each voiding before adding the urine to the container.

# Integumentary System

433. A nurse is preparing to give a client a tepid bath and uses a bath thermometer to test the water temperature. What is the acceptable temperature range for a tepid bath?

1. 92° to 94° F
2. 95° to 97° F
3. 98° to 100° F
4. 101° to 103° F

434. A health care provider orders the application of a warm soak to an IV site that has infiltrated. What principle does the nurse determine is in operation when the application of local heat transfers temperature to the body?

1. Radiation
2. Insulation
3. Convection
4. Conduction

435. A nurse is caring for a client who is admitted to the hospital for medical management of heart failure and severe peripheral edema. For which clinical indicators associated with unresolved severe peripheral edema should the nurse assess the client?

1. Proteinemia
2. Contractures
3. Tissue ischemia
4. Thrombus formation

436. A nurse is assessing a client with a diagnosis of psoriasis. Which clinical findings should the nurse expect to observe? **Select all that apply.**

1. Scaly lesions
2. Pruritic lesions
3. Reddened papules
4. Multiple petechiae
5. Erythematous macules

437. A client with psoriasis asks the nurse what can help this condition. Which should the nurse include in a teaching plan for this client?

1. Avoiding exposure to the sun
2. Topical application of steroids
3. Potassium permanganate baths
4. Débridement of necrotic plaques

438. A nurse is caring for a client with scabies. Which information about scabies should the nurse consider when planning care for this client?

1. Highly contagious
2. Caused by a fungus
3. Chronic with exacerbations
4. Associated with other allergies

439. A nurse is caring for a client with the diagnosis of pemphigus vulgaris. Which expected response does the nurse need to address in the client's plan of care?

1. Paralysis
2. Infertility
3. Skin lesions
4. Impaired digestion

▶440. A nurse is interviewing a client who was diagnosed with systemic lupus erythematosus (SLE). Which common responses to this disease can the nurse expect the client to exhibit? **Select all that apply.**

1. Butterfly facial rash
2. Firm skin fixed to tissue
3. Inflammation of the joints
4. Muscle mass degeneration
5. Inflammation of small arteries

▶441. A nurse is providing counseling to a client with the diagnosis of systemic lupus erythematosus (SLE). What recommendations are essential for the nurse to include? **Select all that apply.**

1. Eat foods high in vitamin C.
2. Take your temperature daily.
3. Balance periods of rest and activity.
4. Use a strong soap when washing the skin.
5. Expose the skin to the sun as often as possible.

442. A client newly diagnosed with scleroderma states, "Where did I get this from?" The nurse's **best** response is "Although no cause has been determined for scleroderma, it is thought to be the result of:

1. autoimmunity."
2. ocular motility."
3. increased amino acid metabolism."
4. defective sebaceous gland formation."

▶443. A nurse is assessing a client with the diagnosis of scleroderma for the signs of CREST syndrome. What clinical indicators should the nurse expect to identify? **Select all that apply.**

1. Joint pain
2. Mask-like facies
3. Esophageal reflux
4. Spider-like hemangiomas
5. Episodic blanching of the fingers

▶444. A client with a spinal cord injury tends to assume the low-Fowler position excessively. Place an X over the area of the body that is most vulnerable to the development of a pressure ulcer in this client.

445. A nurse is assessing a newly admitted client with a pressure ulcer indicated in the picture on the following page. What stage pressure ulcer should the nurse document on the admission history and physical?

1. Stage I
2. Stage II
3. Stage III
4. Stage IV

446. A client with a stage IV pressure ulcer is to receive 0.22 g of zinc sulfate by mouth. Each tablet contains 110 mg. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

447. A nurse is caring for a client admitted for removal of basal cell carcinoma and reconstruction of the nose. About which contributing factor should the nurse question the client when collecting a health history?

1. Dietary patterns
2. Familial tendencies

3. Amount of tobacco use
4. Ultraviolet radiation exposure
448. For which clinical manifestation should the nurse assess a client with metastatic melanoma?
1. Oily skin
  2. Nikolsky sign
  3. Lymphadenopathy
  4. Erythema of the palms
449. A client is admitted for malignant melanoma that was discovered during a routine eye examination. For which preferred treatment does the nurse expect the client to be scheduled?
1. Radiation
  2. Enucleation
  3. Cryosurgery
  4. Chemotherapy
450. A nurse is caring for a client who is scheduled to have a pigskin graft applied to a burned area. Which type of graft is going to be applied by the health care provider?
1. Isograft
  2. Allograft
  3. Homograft
  4. Heterograft
451. A nurse is assessing a client with second-degree burns. The shaded areas in the illustration indicate the parts of the body where the client sustained burns. Calculate the percentage of the body that was burned using the Rule of Nines. **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ %

452. A nurse is evaluating a client's fluid loss resulting from extensive burns. What is the

most valuable blood test to use when monitoring a client's fluid loss?

1. BUN
2. Blood pH
3. Hematocrit
4. Sedimentation rate

453. A nurse is caring for a client who experienced serious burns in a fire. Which relationship between a client's burned body surface area and fluid loss should the nurse consider when evaluating fluid loss in a client with burns?

1. Equal
2. Unrelated
3. Inversely related
4. Directly proportional

454. Which is the most difficult problem for the nurse to manage when meeting the needs of an extensively burned client 3 days after admission?

1. Severe pain
2. Maintenance of sterility
3. Alteration in body image
4. Frequent dressing changes

455. A nurse is caring for a client who has a disturbed body image as a result of a burn injury. Which is an important nursing intervention for this client?

1. Conveying a positive attitude toward the client
2. Arranging for the client to meet other clients with burns
3. Removing mirrors until the client's physical appearance has improved
4. Reminding family members to avoid comments about the client's appearance

456. A nurse is caring for a client who sustained a partial-thickness burn to the lower leg accounting for 5% of the total body surface area 1 day ago. A **primary** short-term outcome established by the nurse and client is "The client's:

1. airway will remain patent."
2. burns will heal free of infection."
3. urine output will exceed 30 mL every hour."
4. pain will remain at 2 or less on a scale of 0 to 10."

457. A worker is involved in an explosion of a steam pipe and receives a scalding burn to the chest and arms. The burned areas are painful, mottled red, weeping, and edematous. Which should the nurse conclude is an appropriate classification for these burns?

1. Eschar
2. Full-thickness
3. Deep partial-thickness
4. Superficial partial-thickness

458. A nurse is caring for a client during the first few hours after admission to the burn unit with partial-thickness burns of the trunk and head. Which potential problem is the **least** concern for the nurse during the emergent phase of a burn injury?

1. Pain
2. Leukopenia

3. Laryngeal edema
4. Fluid volume deficit

459. A nurse is caring for a client during the emergent phase of a severe burn injury. Which parenteral intervention prescribed by the health care provider should the nurse question?

1. Colloids
2. Potassium
3. Hypertonic saline
4. Lactated Ringer solution

460. A nurse is assessing a client during the first 24 hours after a burn injury. Which sign indicates to the nurse that fluid replacement therapy is adequate?

1. Decreasing CVP readings
2. Urinary output of 15 to 20 mL/hr
3. Slowing of a previously rapid pulse
4. Hematocrit level increasing from 50% to 55%

461. A nurse places a client with severe burns on a circulating air bed. What is the **primary** reason why the nurse implements this action?

1. Increase mobility
2. Prevent contractures
3. Limit orthostatic hypotension
4. Prevent pressure on peripheral blood vessels

462. Which information should the nurse include in a teaching plan for a client whose burns are being treated with the exposure method?

1. Bathing will not be permitted.
2. Aseptic techniques are required.
3. Dressings will be changed every 3 days.
4. Room temperature must be kept at 72° F.

463. A severely burned client has been hospitalized for 2 days. Until now recovery has been uneventful, but the client begins to exhibit extreme restlessness. What does the nurse conclude the client is most likely developing?

1. Kidney failure
2. Fluid overload
3. Cerebral hypoxia
4. Metabolic acidosis

464. A client with 35% of total body surface area burned in a fire is now 48 hours postburn. The nurse concludes that the client is moving from the emergent to the acute phase of burn management. Which response supports this conclusion?

1. Hypokalemia
2. Hypoglycemia
3. Decreased blood pressure
4. Increased urine specific gravity

465. Acyclovir (Zovirax) 0.8 g by mouth is prescribed for a client with herpes zoster. The oral suspension contains 200 mg/5 mL. How much solution should the nurse administer?

**Record your answer by using a whole number.**

Answer: \_\_\_\_\_ mL

466. A nurse is caring for a client with a diagnosis of necrotizing fasciitis. Which is the **primary** concern of the nurse when caring for this client?

1. Fluid volume
2. Skin integrity
3. Physical mobility
4. Urinary elimination

# Neuromusculoskeletal System

467. A nurse is planning to transfer a client who is experiencing pain from the bed to a chair. Place the following steps in the order in which they should be implemented.

1. \_\_\_\_\_ Explain the steps of the transfer.
2. \_\_\_\_\_ Verify the client's activity order.
3. \_\_\_\_\_ Ensure that the wheels on the bed are locked.
4. \_\_\_\_\_ Identify factors that may impact the ability to transfer.
5. \_\_\_\_\_ Position the client in functional body alignment before transferring.

468. A nurse identifies which clinical indicator of parasympathetic dominance in a client under stress?

1. Constipation
2. Goose bumps
3. Excess epinephrine secretion
4. Increased gastrointestinal secretions

469. During an annual physical assessment a client reports not being able to smell coffee and most foods. Which cranial nerve function should the nurse assess?

1. I
2. II
3. X
4. VII

470. Which clinical indicator does a nurse identify when assessing a client with hemiplegia?

1. Paresis of both lower extremities
2. Paralysis of one side of the body
3. Paralysis of both lower extremities
4. Paresis of upper and lower extremities

471. The school nurse is attending to a student athlete who reports muscle pain after a practice session. What should the nurse identify as a cause of this pain when providing instruction to the student?

1. Lactic acid
2. Butyric acid
3. Acetoacetic acid
4. Hydrochloric acid

472. A client who had an open reduction and internal fixation of a fractured ankle is being discharged. Which behavior indicates the need for further instruction about the use of crutches?

1. Advancing both crutches with the weaker leg
2. Leaning axillae on the crutches to support the body's weight
3. Transferring the crutches into one hand when sitting in a chair
4. Moving the crutches before the unaffected leg when descending stairs

473. When completing a neurological assessment, the nurse determines that a client has a positive Romberg test. Which finding supports the nurse's conclusion?

1. Inability to stand with feet together when eyes are closed
  2. Fanning of toes when the sole of the foot is firmly stroked
  3. Dilation of pupils when focusing on an object in the distance
  4. Movement of eyes toward the opposite side when head is turned
474. When caring for a client with a head injury that may have involved the medulla, the nurse bases assessments on the knowledge that the medulla controls a variety of functions. Which ones apply? **Select all that apply.**
1. Breathing
  2. Pulse rate
  3. Fat metabolism
  4. Blood vessel diameter
  5. Temperature regulation
475. When performing a neurologic assessment of a client, a nurse identifies that the client has a dilated right pupil. The nurse concludes that this suggests a problem with which cranial nerve?
1. Third
  2. Fourth
  3. Second
  4. Seventh
476. A nurse is assessing a client whose mouth is drawn over to the left. The nurse should consider damage to which cranial nerve to be the **most** likely explanation for this clinical finding?
1. Left facial nerve
  2. Right facial nerve
  3. Left abducent nerve
  4. Right trigeminal nerve
477. After a brain attack a client is unable to differentiate between heat or cold and sharp or dull sensory stimulation. What lobe of the brain should the nurse conclude is likely affected?
1. Frontal
  2. Parietal
  3. Occipital
  4. Temporal
478. A client experiences a traumatic brain injury. Which finding identified by the nurse indicates damage to the upper motor neurons?
1. Absent reflexes
  2. Flaccid muscles
  3. Trousseau sign
  4. Babinski response
479. A nurse is caring for an anxious, fearful client. Which client response indicates sympathetic nervous system control?
1. Dry skin
  2. Skin pallor

3. Constriction of pupils
  4. Pulse rate of 60 beats/min
480. When transporting a client on a stretcher, the nurse makes certain that the client's arms do not hang down over the edge. To which nerve plexus does the nurse avoid injury by taking this precaution?
1. Solar
  2. Celiac
  3. Basilar
  4. Brachial
481. The nurse assists the health care provider to perform a lumbar puncture. When pressure is placed on the jugular vein during a lumbar puncture, the spinal fluid pressure is expected to increase. Which sign should the nurse expect the health care provider to document?
1. Homan
  2. Romberg
  3. Chvostek
  4. Queckenstedt
482. A client has a craniotomy for a meningioma. For what response should the nurse assess the client in the postanesthesia care unit?
1. Dehydration
  2. Blurred vision
  3. Wound infection
  4. Narrowing pulse pressure
483. A client is to have a computed tomography (CT) scan with contrast to assess a potential brain tumor. The nurse should teach the client what common expected responses to the contrast material? **Select all that apply.**
1. Visual disturbances
  2. Flushing of the face
  3. Sensation of warmth
  4. Lemony taste in the mouth
  5. Small petechiae on the arms
484. A nurse is monitoring a client who is having a computed tomography (CT) scan of the brain with contrast. Which response indicates that the client is having an untoward reaction to the contrast medium?
1. Pelvic warmth
  2. Feeling flushed
  3. Shortness of breath
  4. Salty taste in the mouth
485. A client with glaucoma asks a nurse about future treatment and precautions. What information should the nurse's explanation include?
1. Avoidance of cholinergics
  2. Surgical replacement of lens
  3. Continuation of therapy for life

4. Prevention of high blood pressure

486. A client is admitted with paresis of the ciliary muscles of the left eye. What function should the nurse expect to be affected?

1. Closing the eyelids
2. Convergence of both eyes
3. Ability to discriminate colors
4. Focusing the lens on near objects

487. Which desired effect of therapy should the nurse explain to the client who has primary angle-closure glaucoma?

1. Dilating the pupil
2. Resting the eye muscles
3. Preventing secondary infection
4. Controlling intraocular pressure

488. Which clinical indicator is the nurse **most** likely to identify when exploring the history of a client with open-angle glaucoma?

1. Constant blurring
2. Abrupt attacks of acute pain
3. Sudden, complete loss of vision
4. Impairment of peripheral vision

489. A client's relative asks the nurse what a cataract is. What explanation should the nurse provide?

1. An opacity of the lens
2. A thin film over the cornea
3. A crystallization of the pupil
4. An increase in the density of the conjunctiva

490. What should the nurse do for a client who just had cataract surgery?

1. Instruct the client to avoid driving for several weeks.
2. Teach the client coughing and deep-breathing techniques.
3. Advise the client to refrain from vigorous brushing of the teeth and hair.
4. Encourage the client to perform eye exercises to strengthen the ocular musculature.

491. A nurse is caring for a client who is scheduled for surgery for a detached retina. Which goal of surgery identified by the client indicates that the preoperative teaching was effective?

1. Promote growth of new retinal cells
2. Adhere the sclera to the choroid layer
3. Graft a healthy piece of retina in place
4. Create a scar that aids in healing retinal holes

492. A nurse performs a Rinne test during physical assessment of a client. The client indicates that the sound is louder when the vibrating tuning fork is placed against the mastoid bone than when held closely to the ear. What conclusion should the nurse make about these results?

1. This represents an expected finding.
2. The client may have a sensorineural deficit.

3. This is evidence of a conductive hearing loss.
4. The client has an inflammation of the mastoid.
493. A client is scheduled for a labyrinthectomy to treat Ménière syndrome. What expected outcome of the procedure should be included in preoperative teaching?
1. Absence of pain
  2. Decreased cerumen
  3. Loss of sense of smell
  4. Permanent irreversible deafness

494. A nurse is developing a teaching plan for a client with otosclerosis. What information should the nurse include in the teaching plan?

1. Stapedectomy is the procedure of choice.
2. Hearing aids usually restore some hearing.
3. The client is usually unable to hear bass tones.
4. Air conduction is more effective than bone conduction.

495. A client is admitted post traumatic brain injury and multiple fractures. The client's eyes remain closed, and there is no evidence of verbalization or movement when the nurse changes the client's position. What score on the Glasgow Coma Scale should the nurse document? **Record your answer using a whole number.**

Answer: \_\_\_\_\_

496. What clinical indicator does the nurse expect to identify when assessing a client with a brain tumor in the occipital lobe?

1. Hemiparesis
2. Receptive aphasia
3. Personality changes
4. Visual hallucinations

497. A client is to have a parotidectomy to remove a cancerous lesion. For which postoperative complication that may be permanent should the nurse monitor?

1. A tracheostomy
2. Frey syndrome
3. An increase in salivation
4. Facial nerve dysfunction

498. A client who is receiving phenytoin (Dilantin) to control a seizure disorder questions the nurse regarding this medication after discharge. The nurse's **best** response is "This medication:

1. will probably be continued for life."
2. prevents the occurrence of seizures."
3. needs to be taken during periods of emotional stress."
4. can usually be stopped after a year's absence of seizures."

499. A client with a history of seizures is admitted with a partial occlusion of the left common carotid artery. The client has been taking phenytoin (Dilantin) for 10 years. When planning care for this client, what should the nurse do **first**?

1. Place an airway and restraints at the bedside.
2. Obtain a history of seizure type and incidence.

3. Ask the client to remove any dentures and eyeglasses.

4. Observe the client for increased restlessness and agitation.

500. When entering a room on a medical unit, the nurse identifies that a client is having a seizure. What should the nurse do in addition to protecting the client from self-injury?

1. Insert an oral airway.

2. Monitor the seizure activity.

3. Turn the client on the left side.

4. Begin oxygen by mask at 8 L/min.

501. Phenytoin (Dilantin) suspension 200 mg is prescribed for a client with epilepsy. The suspension contains 125 mg/5 mL. How much solution should the nurse administer?

**Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

502. What is the **primary** responsibility of a nurse during a client's generalized motor seizure?

1. Inserting a plastic airway between the teeth

2. Determining whether an aura was experienced

3. Administering the prescribed prn anticonvulsant

4. Clearing the immediate environment for client safety

503. A client who has a history of seizures is scheduled for an arteriogram at 10 AM and is to have nothing by mouth before the test. The client is scheduled to receive an anticonvulsant medication at 9 AM. What should the nurse do?

1. Omit the 9 AM dose of the drug.

2. Give the same dosage of the drug rectally.

3. Administer the drug with 30 mL of water at 9 AM.

4. Ask the health care provider if the drug can be given IV.

504. Several clients are admitted to the emergency department with brain injuries as a result of an automobile collision. The nurse concludes that the client with an injury to which part of the brain will **most** likely not survive?

1. Pons

2. Medulla

3. Midbrain

4. Thalamus

505. After sustaining a head trauma, a client reports hearing ringing noises. The nurse considers that an injury to what part of the body is likely to cause this clinical indicator?

1. Frontal lobe

2. Occipital lobe

3. Sixth cranial nerve (abducent)

4. Eighth cranial nerve (vestibulocochlear)

506. A nurse should expect to identify a loss of which ability when assessing an unconscious client?

1. Hearing voices

2. Moving spontaneously

3. Controlling elimination

4. Reacting to painful stimuli

507. The neurologic assessment of a client who had a craniotomy includes the Glasgow Coma Scale. What does the nurse evaluate to assess the client's score on the Glasgow Coma Scale? **Select all that apply.**

1. Ability of the client's pupils to react to light
2. Degree of purposeful movement by the client
3. Appropriateness of the client's verbal responses
4. Stimulus necessary to cause the client's eyes to open
5. Symmetry of muscle strength of the client's extremities

508. A client regains consciousness and has expressive aphasia. What should the nurse include as part of long-range planning for this client?

1. Provide positive feedback when the client uses a word correctly.
2. Wait for the client to verbally state needs regardless of how long it takes.
3. Suggest that the client get help at home because the disability is permanent.
4. Help the family to accept the fact that the client cannot participate in verbal communication.

509. Soon after admission to the hospital with a head injury, a client's temperature increases to 102.2° F (39° C). The nurse considers that the client has sustained injury to what structure?

1. Thalamus
2. Hypothalamus
3. Temporal lobe
4. Globus pallidus

510. What action should the nurse take when caring for a client who has a possible skull fracture as a result of trauma?

1. Monitor the client for signs of brain injury.
2. Check for hemorrhaging from the oral and nasal cavities.
3. Elevate the foot of the bed if the client develops symptoms of shock.
4. Observe for clinical indicators of decreased intracranial pressure and temperature.

511. A nurse is assessing a client with a brain tumor. Which clinical findings indicate an increase in intracranial pressure? **Select all that apply.**

1. Fever
2. Stupor
3. Orthopnea
4. Rapid pulse
5. Hypotension

512. What therapeutic effect does the nurse expect to identify when mannitol (Osmitrol) is administered parenterally to a client with cerebral edema?

1. Improved renal blood flow
2. Decreased intracranial pressure
3. Maintenance of circulatory volume
4. Prevention of the development of thrombi

513. A client had a craniotomy for excision of a brain tumor. After surgery, the nurse

monitors the client for increased intracranial pressure. Which clinical finding supports an increase in intracranial pressure?

1. Thready, weak pulse
2. Narrowing pulse pressure
3. Regular, shallow breathing
4. Lowered level of consciousness

514. When caring for a client who has sustained a head injury, it is important that the nurse assess for which clinical indicator?

1. Slowing of the heart rate
2. Decreased carotid pulses
3. Bleeding from the oral cavity
4. Absence of deep tendon reflexes

515. A client develops hydrocephalus 2 weeks after cranial surgery for a ruptured cerebral aneurysm. The nurse concludes that the hydrocephalus probably is related to which physiologic response?

1. Vasospasm of adjacent cerebral arteries
2. Ischemic changes in the Broca speech center
3. Increased production of cerebrospinal fluid
4. Blocked absorption of fluid from the arachnoid space

516. What should the nurse assess for in the immediate postoperative period after a client has brain surgery?

1. Tachycardia
2. Constricted pupils
3. Elevated diastolic pressure
4. Decreased level of consciousness

517. What nursing action is essential when a client experiences hemianopsia as the result of a left ischemic stroke?

1. Place objects within the visual field.
2. Teach passive range of motion exercises.
3. Instill artificial tear drops into the affected eye.
4. Reduce time client is positioned on the left side.

518. During a health fair, the nurse takes an adult's blood pressure and it is 200/120 mm Hg. The nurse should base the next nursing intervention on the understanding that:

1. there is an increased risk for having a brain attack.
2. walking around the fair probably raised the blood pressure.
3. the elevated blood pressure reflects the "white coat syndrome."
4. information should be obtained regarding prescribed medications.

519. Which health problem does the nurse identify from an older client's history that increases the client's risk factors for a brain attack?

1. Glaucoma
2. Hypothyroidism
3. Continuous nervousness

4. Transient ischemic attacks

520. Which clinical indicator is the nurse **most** likely to identify when assessing a client with a ruptured cerebral aneurysm?

1. Tonic-clonic seizures
2. Decerebrate posturing
3. Sudden severe headache
4. Narrowed pulse pressure

521. A client with a brain attack is comatose on admission. Which clinical indicator is the nurse **most** likely to identify?

1. Twitching motions
2. Purposeful motions
3. Urinary incontinence
4. Unresponsiveness to pain

522. In which position should the nurse **initially** place a client who has experienced a brain attack?

1. Prone
2. Lateral
3. Supine
4. Trendelenburg

523. The family members of a client with the diagnosis of brain attack (CVA) express concern that the client often becomes uncontrollably tearful during their visits. What should the nurse include in a response?

1. Emotional lability is associated with brain trauma.
2. Their presence allows the client to express feelings.
3. The client is depressed about the loss of functional abilities.
4. Nonverbal expressions of feelings are more accurate than verbal ones.

524. Which function must be addressed in the plan of care when a client has dysphagia?

1. Writing
2. Focusing
3. Swallowing
4. Understanding

525. A client with a brain attack has dysarthria. What should the nurse include in the plan of care to address this problem?

1. Routine hygiene
2. Liquid formula diet
3. Prevention of aspiration
4. Effective communication

526. A client with a brain attack has right hemiplegia. What occurs if the nurse uses the client's right arm to obtain a blood pressure reading?

1. Produces inaccurate readings
2. Hinders restoration of function
3. Precipitates the formation of a thrombus
4. Causes excessive pressure on the brachial artery

527. Bed rest is ordered after a client's brain attack results in hemiplegia. Which exercises should the nurse incorporate into the client's plan of care 24 hours after the brain attack?

1. Passive range-of-motion exercises
2. Active exercises of the extremities
3. Light weight-lifting exercises of the right side
4. Isotonic exercises that will capitalize on returning muscle function

528. Which clinical indicators does the nurse identify that suggest that a client is experiencing urinary retention and overflow after a brain attack? **Select all that apply.**

1. Edema
2. Oliguria
3. Frequent voidings
4. Suprapubic distention
5. Continual incontinence

529. A client has left hemiplegia because of a brain attack. What can the nurse do to contribute to the client's rehabilitation?

1. Begin active exercises.
2. Make a referral to the physical therapist.
3. Position the client to prevent contractures.
4. Avoid moving the affected extremities unless necessary.

530. A client had a brain attack and bed rest is ordered. What can the nurse use to **best** prevent footdrop in this client?

1. Splints
2. Blocks
3. Cradles
4. Sandbags

531. What is the maximum amount of time the nurse should allow an older adult with a brain attack to remain in one position?

1. 1 to 2 hours
2. 3 to 4 hours
3. 15 to 20 minutes
4. 30 to 40 minutes

532. A client with a hemiparesis is reluctant to use a cane. The nurse explains to the client that the cane is needed to:

1. maintain balance to improve stability.
2. relieve pressure on weight-bearing joints.
3. prevent further injury to weakened muscles.
4. aid in controlling involuntary muscle movements.

533. On which principle should a nurse base client teaching when planning to assist a client to reestablish a regular pattern of defecation?

1. Sedentary activities produce muscle atony.
2. Increased fluid promotes ease of evacuation.
3. Peristalsis is initiated by the gastrocolic reflex.
4. Increased potassium is needed for normal neuromuscular irritability.

534. A nurse may find that, for optimum nutrition, a client with a brain attack needs assistance with eating. What should the nurse do?

1. Request that the client's food be pureed.
2. Feed the client to conserve the client's energy.
3. Have a family member assist the client with each meal.
4. Encourage the client to participate in the feeding process.

535. A client with a brain attack becomes incontinent of feces. What is the **most** important nursing action to support the success of a bowel training program?

1. Using medication to induce elimination
2. Adhering to a definite time for attempted evacuations
3. Considering previous habits associated with defecation
4. Timing of elimination to take advantage of the gastrocolic reflex

536. A nurse is caring for a client who has urinary incontinence as the result of a brain attack. What action should the nurse include in the plan of care to limit the occurrence of urinary incontinence?

1. Insert a urinary retention catheter.
2. Institute measures to prevent constipation.
3. Encourage an increase in the intake of caffeine.
4. Suggest that a carbonated beverage be ingested daily.

537. The spouse of a client who had a brain attack seems unable to accept the concept that the client must be encouraged to participate in self-care. What is the **best** response by the nurse?

1. Tell the spouse to let the client do things independently.
2. Allow the spouse to assume total responsibility for the client's care.
3. Explain that the nursing staff has full responsibility for the client's activities.
4. Ask the spouse for assistance in planning those activities most helpful to the client.

538. The spouse of a client with a brain attack insists on doing everything for the client during visits. After these visits, the client seems to be depressed. The nurse understands that these visits probably have what effect on the client?

1. Losing faith in the future
2. Feeling the loss of independence
3. Experiencing guilt about being a burden
4. Recognizing that the spouse is now the leader in the relationship

539. A client is diagnosed as having expressive aphasia. What type of impairment does the nurse expect the client to exhibit?

1. Speaking and/or writing
2. Following specific instructions
3. Understanding speech and/or writing
4. Recognizing words for familiar objects

540. What actions should the nurse include when planning for the long-term care of a client with expressive aphasia?

1. Begin helping the client to associate words with physical objects.
2. Encourage the client to acknowledge that this disability is permanent.

3. Wait for communication to be initiated by the client even if it takes a long time.
4. Assist family members to accept the fact that they cannot communicate verbally with the client.

541. Which nursing action is specific to the plan of care for a client with trigeminal neuralgia?

1. Be alert to prevent dehydration or starvation.
2. Initiate exercises of the jaw and facial muscles.
3. Apply ice compresses to the affected body area.
4. Emphasize the importance of brushing the teeth.

542. Which clinical indicators does the nurse expect to identify when assessing a client with tic douloureux? **Select all that apply.**

1. Multiple petechiae
2. Excruciating facial pain
3. Twitching of the mouth
4. Unilateral muscle weakness
5. Fine motor tremors of the eyelid

543. What action should the nurse take to prevent precipitating a painful attack in a client with tic douloureux?

1. Avoid walking swiftly by the client.
2. Keep the client in the prone position.
3. Discontinue oral hygiene temporarily.
4. Massage both sides of the face frequently.

544. A client is diagnosed with trigeminal neuralgia. Which medication should the nurse anticipate will be prescribed for this client?

1. Ascorbic acid
2. Morphine sulfate
3. Allopurinol (Zyloprim)
4. Carbamazepine (Tegretol)

545. Which clinical indicators does the nurse expect to identify when assessing a client with trigeminal neuralgia (tic douloureux)? **Select all that apply.**

1. Prolonged periods of sleep because of anxiety
2. Hyperactivity because of medications received
3. Exhaustion and fatigue because of the extreme pain
4. Excessive talkativeness because of anxiety and apprehension
5. Inadequate nutritional intake because of fear of precipitating an attack

546. What should the nurse instruct the client to do to limit triggering the pain associated with trigeminal neuralgia?

1. Drink iced liquids.
2. Avoid oral hygiene.
3. Apply warm compresses.
4. Chew on the unaffected side.

547. What should the nurse include when planning care for a client with Bell palsy?

1. Managing incontinence

2. Assisting with ambulation
3. Preventing corneal damage
4. Maintaining seizure precautions

548. A teenager is brought to the emergency department exhibiting slurring speech, a slight right-sided facial droop, and an inability to close the right eyelid. Bell palsy is diagnosed. List the following concerns in priority order for this client.

1. \_\_\_\_\_ Low self-esteem because of appearance
2. \_\_\_\_\_ Chance of falls because of altered vision
3. \_\_\_\_\_ Risk for malnutrition because of facial droop
4. \_\_\_\_\_ Difficulty communicating because of slurred speech
5. \_\_\_\_\_ Risk for dental caries because of retained food particles

549. Which clinical findings does the nurse anticipate a client with an exacerbation of multiple sclerosis to experience? **Select all that apply.**

1. Double vision
2. Resting tremors
3. Flaccid paralysis
4. Scanning speech
5. Mental retardation

550. Which statement by a client with multiple sclerosis indicates to the nurse that the client needs further teaching?

1. "I use a straw to drink liquids."
2. "I will take a hot bath to help relax my muscles."
3. "I plan to use an incontinence pad when I go out."
4. "I may be having a rough time now, but I hope tomorrow will be better."

551. A recently hospitalized client with multiple sclerosis is concerned about generalized weakness and fluctuating physical status. What is the **priority** nursing intervention for this client?

1. Encourage bed rest.
2. Space activities throughout the day.
3. Teach the limitations imposed by the disease.
4. Have one of the client's relatives stay at the bedside.

552. A client with Guillain-Barré syndrome has been hospitalized for 3 days. Which assessment finding indicates a need for more frequent monitoring?

1. Localized seizures
2. Skin desquamation
3. Hyperactive reflexes
4. Ascending weakness

553. What does the nurse understand that clients with myasthenia gravis, Guillain-Barré syndrome, and amyotrophic lateral sclerosis (ALS) share in common?

1. Progressive deterioration until death
2. Deficiencies of essential neurotransmitters
3. Increased risk for respiratory complications
4. Involuntary twitching of small muscle groups

554. A nurse is caring for a client with the diagnosis of Guillain-Barré syndrome. The nurse identifies that the client is having difficulty expectorating respiratory secretions. What should be the nurse's **first** intervention?

1. Auscultate for breath sounds.
2. Suction the client's oropharynx.
3. Administer oxygen via nasal cannula.
4. Place the client in the orthopneic position.

555. What nursing intervention is anticipated for a client with Guillain-Barré syndrome?

1. Providing a straw to stimulate the facial muscles
2. Maintaining ventilator settings to support respiration
3. Encouraging aerobic exercises to avoid muscle atrophy
4. Administering antibiotic medication to prevent pneumonia

556. A nurse is caring for a client in the home who has the diagnosis of amyotrophic lateral sclerosis (ALS). Which position should the nurse recommend that the client assume after eating?

1. Sims
2. Sitting
3. Side-lying
4. Semi-Fowler

557. A home care nurse is counseling a client with amyotrophic lateral sclerosis (ALS). What information should the nurse include in the discussion? **Select all that apply.**

1. Space activities throughout the day.
2. Engage in social interactions with large groups.
3. Request an opioid if leg pain becomes excessive.
4. Anticipate the use of alternate ways to communicate.
5. Use leg restraints to decrease the risk of physical injury.

558. A client with myasthenia gravis experiences dysphagia. What is the **priority** risk associated with dysphagia that must be considered when planning nursing care?

1. Aspiration
2. Dehydration
3. Nutritional imbalance
4. Impaired communication

559. A client with myasthenia gravis asks the nurse why the disease has occurred. What pathology underlies the nurse's reply?

1. A genetic defect in the production of acetylcholine
2. An inefficient use of the neurotransmitter acetylcholine
3. A decreased number of functioning acetylcholine receptor sites
4. An inhibition of the enzyme AChE, leaving the end-plates folded

560. A client with myasthenia gravis asks the nurse, "What is going to happen to me and to my family?" What information about what the client can anticipate should be incorporated into the nurse's response?

1. High cure rate with proper treatment
2. Slowly progressive course without remissions

3. Chronic illness with exacerbations and remissions
  4. Poor prognosis, with death occurring in a few months
561. A nurse enters the room of a client with myasthenia gravis and identifies that the client is experiencing increased dysphagia. What should the nurse do **first**?
1. Administer oxygen.
  2. Raise the head of the bed.
  3. Perform tracheal suctioning.
  4. Call the health care provider.
562. To what does the nurse attribute the increased risk of respiratory complications in clients with myasthenia gravis?
1. Narrowed airways
  2. Impaired immunity
  3. Ineffective coughing
  4. Viscosity of secretions
563. A client with myasthenia gravis has been receiving neostigmine (Prostigmin) and asks about its action. What information about its action should the nurse consider when formulating a response?
1. Stimulates the cerebral cortex
  2. Blocks the action of cholinesterase
  3. Replaces deficient neurotransmitters
  4. Accelerates transmission along neural sheaths
564. A client with myasthenia gravis continues to become weaker despite treatment with neostigmine (Prostigmin). What reason should the nurse identify for the health care provider's prescription for edrophonium (Enlon)?
1. Rule out cholinergic crisis
  2. Promote a synergistic effect
  3. Overcome neostigmine resistance
  4. Confirm the diagnosis of myasthenia
565. A client is diagnosed with Parkinson disease and asks the nurse what causes the disease. On which underlying pathology does the nurse base a response?
1. Disintegration of the myelin sheath
  2. Breakdown of the corpora quadrigemina
  3. Reduced acetylcholine receptors at synapses
  4. Degeneration of the neurons of the basal ganglia
566. A nurse is interviewing a client with a tentative diagnosis of Parkinson disease. What should the nurse expect the client to report about how the onset of symptoms occurred?
1. Suddenly
  2. Gradually
  3. Overnight
  4. Irregularly
567. A client with the diagnosis of Parkinson disease asks the nurse, "Why do I drool so much?" Which is the nurse's **best** response?

1. "We don't know why this happens."
2. "There is a paralysis of the throat muscles."
3. "You have a loss of involuntary movements."
4. "Muscle rigidity prevents normal swallowing."

568. Which clinical indicators does the nurse expect a client with Parkinson's disease to exhibit? **Select all that apply.**

1. Resting tremors
2. Flattened affect
3. Muscle flaccidity
4. Tonic-clonic seizures
5. Slow voluntary movements

569. When helping a client with Parkinson disease to ambulate, what instructions should the nurse give the client?

1. Avoid leaning forward.
2. Hesitate between steps.
3. Rest when tremors are experienced.
4. Keep arms close to the center of gravity.

570. A nurse administers carbidopa-levodopa (Sinemet) to a client with Parkinson disease. Which therapeutic effect does the nurse expect the medication to produce?

1. Increase in acetylcholine production
2. Regeneration of injured thalamic cells
3. Improvement in myelination of neurons
4. Replacement of a neurotransmitter in the brain

571. Which clinical indicator does the nurse expect to identify when assessing a client admitted with a herniated lumbar disk?

1. Pain radiating to the hip and leg
2. Bowel and bladder incontinence
3. Paralysis of both lower extremities
4. Overgrowth of tissue on the lower back

572. A nurse expects a client with a herniated intervertebral disk to report a sudden increase in pain with which activities? **Select all that apply.**

1. Coughing or sneezing
2. Sitting on cold surfaces
3. Standing for extended periods
4. Lying supine while flexing the knees
5. Straining when having a bowel movement

573. For which clinical indicator should the nurse assess a client who just had a microdiscectomy for a herniated lumbar disk?

1. Cerebral edema
2. Sensory loss in legs
3. Spasms of the bladder
4. Pain referred to the flanks

574. What should the nurse include in the plan of care for a client who just had a

posterior lumbar laminectomy?

1. Encourage the client to cough.
2. Reposition the client by log rolling.
3. Assess the client for indications of peritonitis.
4. Instruct the client to bend the knees when turning.

575. What does the nurse do for a client with a cervical laminectomy that differs from the nursing care for a client with a lumbar laminectomy?

1. Assist with the removal of oral secretions.
2. Maintain the client's head in a flexed position.
3. Elevate the head of the client's bed to a 45-degree angle.
4. Provide range-of-motion exercise early during the postoperative period.

576. A nurse finds a victim under the wreckage of a collapsed building. The individual is conscious, supine, breathing satisfactorily, and reporting back pain and an inability to move the legs. Which action should the nurse take **first**?

1. Leave the individual lying on the back with instructions not to move, and seek additional help.
2. Roll the individual onto the abdomen, place a pad under the head, and cover with any material available.
3. Gently raise the individual to a sitting position to see whether the pain either diminishes or increases in intensity.
4. Gently lift the individual onto a flat piece of lumber and, using any available transportation, rush to the closest medical institution.

577. After a client is treated for a spinal cord injury, the health care provider informs the family that the client is a paraplegic. The family asks the nurse what this means. What explanation should the nurse provide?

1. Lower extremities are paralyzed.
2. Upper extremities are paralyzed.
3. One side of the body is paralyzed.
4. Both lower and upper extremities are paralyzed.

578. A client with a spinal cord injury has paraplegia. The nurse assesses for which major problem the client may experience early in the recovery period?

1. Bladder control
2. Nutritional intake
3. Quadriceps setting
4. Use of aids for ambulation

579. A nurse should expect a client with a spinal cord injury to have some spasticity of the lower extremities. What should the nurse include in the plan of care for this client to prevent the development of lower extremity contractures?

1. Deep massage
2. Active exercise
3. Use of a tilt board
4. Proper positioning

580. A client has paraplegia as a result of a motorcycle accident. What is the reason the

nursing care plan should include turning the client every 1 to 2 hours?

1. Maintain comfort
2. Prevent pressure ulcers
3. Prevent flexion contractures of the extremities
4. Improve venous circulation in the lower extremities

581. What problem is the nurse primarily attempting to prevent when encouraging a client with a spinal cord injury to increase oral fluid intake?

1. Dehydration
2. Skin breakdown
3. Electrolyte imbalances
4. Urinary tract infections

582. A client has a functional transection of the spinal cord at C7-8, resulting in spinal shock. Which clinical indicators does the nurse expect to identify when assessing the client immediately after the injury? **Select all that apply.**

1. Spasticity
2. Incontinence
3. Flaccid paralysis
4. Respiratory failure
5. Lack of reflexes below the injury

583. After a traumatic spinal cord severance, a young client is having difficulty accepting the paralysis. One day the client has severe leg spasms and says, "My strength is coming back, and I know I will walk again." The nurse's response should be based on what understanding?

1. The nerves are regenerating and motor function is returning.
2. Motor function may be returning now that the edema is subsiding.
3. Spinal shock has subsided and the client's reflexes are hyperactive.
4. The client has developed thrombophlebitis and is experiencing pain.

584. What should the nurse assess for when a client with a cervical injury reports a severe headache and nasal congestion?

1. Suprapubic distention
2. Increased spinal reflexes
3. Adventitious breath sounds
4. Imminent development of shock

585. A client with quadriplegia is placed on a tilt table daily. Each day the angle of the head of the table gradually is increased. What should the nurse identify as its purpose when the client asks the reason for the tilt table?

1. Facilitates turning
2. Prevents pressure ulcers
3. Promotes hyperextension of the spine
4. Limits loss of calcium from the bones

586. A nurse in a rehabilitation center teaches clients with quadriplegia to use an adaptive wheelchair. Why is it important that the nurse provide this instruction?

1. They usually will never walk.

2. It prepares them for wearing braces.
3. It assists them in overcoming orthostatic hypotension.
4. They have the strength in the upper extremities for self-transfer.

587. A client who had a total hip replacement asks the nurse about the continuous regional analgesia being used. What information should the nurse include when explaining the benefits of this treatment over conventional methods to control pain?

1. Adjusting the dose is easily done.
2. Neuropathic pain can be relieved.
3. Systemic side effects are minimal.
4. The need for parenteral medication is avoided.

588. Which nursing action is contraindicated when caring for a client with a newly applied long leg cast?

1. Elevating the cast on a pillow
2. Drying the cast by using a fan
3. Leaving the cast exposed to air
4. Handling the cast with fingertips

589. Colchicine 1200 mcg orally is prescribed for client with gout. Each tablet contains 0.6 mg. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

590. What should the nurse consider as the goal of therapy when administering allopurinol (Zyloprim) to a client with gout?

1. Increase bone density
2. Decrease synovial swelling
3. Decrease uric acid production
4. Prevent crystallization of uric acid

591. A client is admitted with acute gouty arthritis. Which medication does the nurse anticipate the health care provider may prescribe to prevent and treat an acute attack of gout?

1. Ibuprofen (Motrin)
2. Colchicine (Colsalide)
3. Probenecid (Benemid)
4. Hydrocortisone (Cortef)

592. Which foods should the nurse teach a client with gout to avoid to limit painful attacks? **Select all that apply.**

1. Eggs
2. Liver
3. Cheese
4. Salmon
5. Shellfish

593. A health care provider orders the application of warm compresses for a client with arthritis. What is the appropriate temperature range for the compresses that the nurse applies?

1. 65° to 79° F (18.3° to 26.1° C)
2. 80° to 92° F (26.6° to 33.3° C)
3. 93° to 97° F (33.8° to 36.1° C)
4. 98° to 105° F (36.6° to 40.5° C)

594. A nurse suspects the development of compartment syndrome for a client who has sustained blunt trauma to the forearm. For which early sign of compartment syndrome should the nurse assess the client?

1. Warm skin at site of injury
2. Escalating pain in the fingers
3. Rapid capillary refill in affected hand
4. Bounding radial pulse in the injured arm

595. A client experiences a traumatic amputation of a leg in a motor vehicle accident. Which nursing intervention **initially** should receive the lowest priority?

1. Teaching residual limb care
2. Monitoring hemoglobin levels
3. Maintaining the compression dressing
4. Using therapeutic interviewing techniques

596. A client has an amputation of a lower limb. What instructions should the nurse give the client to prevent a hip flexion contracture?

1. Turn from side to side every 1 to 2 hours.
2. Sit in a chair for 30 minutes three times a day.
3. Lie on the abdomen 30 minutes four times daily.
4. Perform quadriceps muscle setting exercises twice daily.

597. What should the nurse do to control edema of the residual limb 1 week after a client has an above-the-knee amputation?

1. Administer the prescribed diuretic.
2. Restrict the client's oral fluid intake.
3. Rewrap the elastic bandage as necessary.
4. Keep the residual limb elevated on a pillow.

598. What should be included in the nurse's instructions to help a client prepare for walking with crutches?

1. Use of the trapeze to strengthen the biceps muscles
2. Exercises with or without weights to strengthen the muscles of the upper extremities
3. The importance of keeping the affected limb in extension and abduction to prevent contractures
4. Isometric exercises of the hamstring muscles while sitting in a chair until circulatory status is stable

599. What should the nurse do to promote early and efficient ambulation after a client has a midhigh amputation?

1. Keep the head of the bed elevated.
2. Place the residual limb on a pillow.
3. Turn the client to the prone position routinely.
4. Encourage the client to lie on the unaffected side.

600. A client has a total hip replacement. Which clinical indicators of pulmonary embolism indicate that the plan to prevent postoperative thrombus formation has been ineffective? **Select all that apply.**

1. Flushing of the face
2. Unilateral chest pain
3. Elevation of temperature
4. Sudden onset of shortness of breath
5. Pain rating increase from 2 to 8 in the hip

601. What instructions should the nurse provide when the client is allowed out of bed after an above-the-knee amputation?

1. Keep the hip in extension and alignment.
2. Keep the hip raised with the residual limb elevated.
3. Lift the shoulder and hip of the affected side when taking a step.
4. Use the ordered crutches until the residual limb is completely healed.

602. A client has a total knee replacement, and a continuous passive motion device is being used. The nurse concludes that the teaching was effective when the client states, "The goal of this therapy is to:

1. improve joint flexion."
2. maintain muscle tone."
3. prevent tissue breakdown."
4. avoid formation of a blood clot."

603. When should the nurse begin the process of rehabilitation when a client is scheduled for an amputation?

1. Before the surgery
2. During the convalescent phase
3. On discharge from the hospital
4. When it is time for a prosthesis

604. After an above-the-knee amputation of a leg, a client reports pain in the foot that is no longer there. What should the nurse include about phantom limb pain in a discussion with the client?

1. Tactile illusions associated with severed blood vessels
2. Nerve endings in the limb are still intact and react to stimuli
3. An unconscious phenomenon to aid with grieving over the lost body part
4. Hallucinations secondary to emotional symptoms associated with the distress of amputation

605. Which crutch gait should the nurse teach the client wearing a prosthesis after a single-leg amputation?

1. Tripod
2. Four-point
3. Three-point
4. Swing-through

606. A client had an above-the-knee amputation of the left leg because of trauma from a motor vehicle collision. The health care provider orders ambulation with crutches until

the residual limb is healed and the client can be fitted with a prosthesis. What should be the nurse's **first** intervention?

1. Demonstrate the swing-through crutch walking gait.
2. Determine if the client has ever used crutches before.
3. Introduce the client to another client who is using crutches.
4. Provide a pamphlet that has information about using crutches.

607. Which principle should the nurse consider when assisting a client with crutches to learn the four-point gait?

1. Elbows should be kept in rigid extension.
2. Most of the weight should be supported by axillae.
3. The client must be able to bear weight on both legs.
4. The affected extremity should be kept off the ground.

608. A client is in skin traction while awaiting surgery for repair of a fractured femur. The client reports leg discomfort and asks the nurse to release the traction. Which is the nurse's **best initial** response?

1. "I can't because the weights are needed to keep the bone aligned."
2. "I will remove half of the weights and notify your health care provider."
3. "I'll get your prescribed pain medication to help relieve your discomfort."
4. "I have to follow the health care provider's directions, and releasing weights is not ordered."

609. For what clinical findings of compromised circulation should the nurse assess in a client with a long leg cast? **Select all that apply.**

1. Foul odor
2. Swelling of the toes
3. Drainage on the cast
4. Increased temperature
5. Prolonged capillary refill

610. A client has a long leg cast. What instructions should the nurse give the client in preparation for crutch walking?

1. Use the trapeze to strengthen the biceps
2. Keep the affected limb in extension and abduction
3. Sit up straight in a chair to develop the back muscles
4. Do exercises in bed to strengthen the upper extremities

611. What intervention should the nurse avoid to prevent contractures of the joints of the lower extremities in a client with paraplegia?

1. Changing the client's bed position hourly
2. Using supportive devices to maintain alignment
3. Providing the client with active exercise instructions
4. Performing passive range-of-motion exercises several times daily

612. What does the nurse determine is the **most** likely cause of renal calculi in clients with paraplegia?

1. High fluid intake
2. Increased intake of calcium

3. Inadequate kidney function

4. Accelerated bone demineralization

613. A client who has been immobilized for an extended period questions the need for a tilt table. The nurse's **best** response is "The tilt table is used to help:

1. prevent hypertension."

2. encourage increased activity."

3. maintain circulation to the skin."

4. prevent loss of calcium from long bones."

614. A client is placed into a whirlpool tub for range-of-motion exercises. The client asks the nurse about the need to exercise in water. The nurse should explain that rehabilitating exercises carried out underwater utilize the water's:

1. pressure.

2. temperature.

3. buoyant force.

4. vapor production.

615. Which clinical indicator should the nurse expect to identify when assessing a client with a fracture of the neck of the femur?

1. Adduction with internal rotation

2. Abduction with external rotation

3. Shortening of the affected extremity with external rotation

4. Lengthening of the affected extremity with internal rotation

616. A client with a fractured hip is placed in traction until surgery can be performed. What should the nurse explain is the purpose of the traction?

1. Relieve muscle spasm and pain

2. Prevent contractures from developing

3. Keep the client from turning and moving in bed

4. Maintain the limb in a position of external rotation

617. A client is admitted with a fracture of the neck of the femur. In what position should the nurse maintain the client's affected extremity?

1. Internal rotation with flexion of the knee and hip

2. External rotation with flexion of the knee and hip

3. Internal rotation with extension of the knee and hip

4. External rotation with extension of the knee and hip

618. The care plan for a client with a fractured hip includes nursing actions to prevent which type of contracture?

1. Flexion of the hip

2. Abduction of the hip

3. Hyperextension of the hip

4. Internal rotation of the hip

619. A nurse is caring for a client who developed aseptic necrosis after a fracture of the head of the femur. The nurse understands that aseptic necrosis is associated with which factor?

1. Infection at the site of the wound

2. Weight-bearing before the fracture is healed
3. Immobilization after reduction of the fracture
4. Loss of blood supply to the head of the femur

620. To reduce a hip fracture, the client is placed in traction before surgery for an open reduction and internal fixation. Because the client keeps slipping down in bed, increased countertraction is ordered. How does the nurse increase the countertraction?

1. Elevate the head of the bed
2. Add more weight to the traction
3. Use a slight Trendelenburg position
4. Tie a chest restraint around the client

621. A nurse is caring for a client who had an open reduction and internal fixation of a femoral neck fracture. The client has an order for ambulation with slight weight-bearing on the affected extremity. During the physical assessment the nurse identifies that the client has kyphosis and strong upper arm strength. What assistive device does the nurse expect the health care provider to order for this client?

1. Crutches
2. Quad cane
3. Straight cane
4. Standard walker

622. Which position should a nurse avoid placing a client who had surgery for a total hip replacement?

1. Supine
2. Lateral
3. Orthopneic
4. Semi-Fowler

623. A nurse is caring for a client who had a total hip replacement. What nursing action should be incorporated into the plan of care to prevent thrombus formation?

1. Turning the client from side to side
2. Encouraging the client to perform ankle exercises
3. Getting the client up to sit in a chair for as long as tolerated
4. Ambulating the client when the effects of anesthesia subside

624. Nursing care of a client with a fractured hip should include the assessment of pedal pulses. The nurse should assess for which important characteristics of the pedal pulses?

1. Contractility and rate
2. Color of skin and rhythm
3. Amplitude and symmetry
4. Local temperature and visible pulsations

625. A nurse receives a change-of-shift report for a client who had a total hip replacement 24 hours ago. After reviewing the client's clinical record (shown here) and completing a physical assessment, which complication should the nurse conclude that the client is experiencing?

## Client Chart

### History

The client is a 43-year-old ironworker who experienced a crushing occupational injury requiring a total hip replacement. He is relatively healthy but is 10% overweight, smokes 2 packs a day, and is borderline for type 2 diabetes.

### Vital Signs

T: 101.4° F, P: 100, R: 30, BP: 160/100

### Physical Assessment

Dyspnea

Altered mental state

Restlessness and agitation

Petechial rash on the neck and chest

Urine collection bag contains 50 mL output for last hour, and the I&O flow sheet indicates 250 mL output over the last 4 hours.

1. Fat embolism
  2. Urinary retention
  3. Hypovolemic shock
  4. Pulmonary embolism
626. A nurse is caring for a client who had a total hip replacement. What is the **priority** assessment when monitoring the client for hemorrhage?
1. Checking vital signs every four hours
  2. Examining the bedding under the client
  3. Measuring the circumference of the thigh
  4. Observing for ecchymosis at the operative site
627. When a client is in the right side-lying position after the insertion of a left hip prosthesis, the nurse ensures that the client has a pillow placed between the thighs and that the entire length of the upper leg is supported. What does this pillow prevent?
1. Strain on the operative site
  2. Thrombus formation in the leg
  3. Flexion contractures of the hip joint
  4. Skin surfaces from rubbing together
628. Which is an example of the principles of body mechanics that the nurse uses when caring for immobilized clients?
1. Bending at the waist to provide the power for lifting
  2. Placing the feet apart to increase the stability of the body
  3. Keeping the body straight when lifting to reduce pressure on the abdomen
  4. Relaxing the abdominal muscles while using the extremities to prevent strain

629. After an open reduction and internal fixation of a fractured hip, what assessments of the client's affected leg should the nurse make? **Select all that apply.**

1. Skin temperature
2. Mobility of the hip
3. Sensation in the toes
4. Condition of the pins
5. Presence of pedal pulse

630. A client with a fractured hip is helped from the bed to a chair after surgery. The nurse instructs the client to bear most of the weight on the unaffected leg before sitting in a chair. What should the nurse explain is the benefit of bearing most of the weight on the unaffected leg?

1. Can increase circulation in the lower extremities
2. Will help maintain the strength of the unaffected limb
3. Is the quickest method of getting the client to and from the bed
4. Reduces the amount of help necessary to lift the client from the bed to the chair

631. On the first postoperative day after a total hip replacement a client asks for assistance onto the bedpan. What should the nurse instruct the client to do?

1. Use the elbows and hands to lift the pelvis off the bed.
2. Extend both legs and pull on the trapeze to lift the pelvis.
3. Turn gently toward the operative side while lifting the pelvis off the bed.
4. Flex the knee on the unoperated leg and pull on the trapeze to lift the pelvis.

632. A client is ready to walk with crutches after knee surgery. Which crutch-walking technique will the nurse **most** likely have to reinforce after the client returns from physical therapy?

1. Two-point
2. Four-point
3. Three-point
4. Swing-through

633. A nurse is teaching crutch walking to a client who had arthroscopic surgery of the knee. On which part of the body should the nurse instruct the client to place weight?

1. The upper arms
2. The axillary region
3. Palms of the hands
4. Both lower extremities

634. A nurse provides discharge teaching for a client who had a total hip replacement. Which activities to avoid identified by the client indicate an understanding of the teaching? **Select all that apply.**

1. Climbing stairs
2. Crossing the legs
3. Stretching exercises
4. Sitting in a low chair
5. Lying prone for 30 minutes

635. What is the nurse's **primary** consideration when caring for a client with rheumatoid

arthritis?

1. Surgery
2. Comfort
3. Education
4. Motivation

636. A nurse is caring for a client with rheumatoid arthritis. Based on the client's diagnosis, the nurse should review the result of which laboratory test?

1. Pancreatic lipase
2. Bence Jones protein
3. Antinuclear antibody
4. Alkaline phosphatase

▶637.

### **Health Care Provider Progress Note**

Client has stage III rheumatoid arthritis, which is progressively causing more joint deformity, stiffness, and pain.

### **Nurse's History and Physical Assessment**

Client has ulnar drift of both hands and hallux valgus deformity of both feet. Client reports pain when walking and joint stiffness for several hours in the morning, particularly the small joints of the hands and feet. Joints of the hands reflect signs and symptoms of inflammation (heat, swelling, tenderness).

### **Laboratory Results**

Rheumatoid factor (RF): 1 : 70 (positive for rheumatoid arthritis)

Erythrocyte sedimentation rate (ESR): 40 mm/hour

C-reactive protein (CRP): 20 mg/dL

WBC 13,000/ $\mu$ l

A nurse is caring for a client attending a community-based health center and reviews the client's medical record. What should the nurse encourage the client to do?

1. Wring a sponge repeatedly when washing dishes.
2. Install faucets that require turning rather than pushing.
3. Engage in a sewing project several hours each morning.
4. Push with the palms rather than the fingers when rising from a chair.

638. A nurse plans care to prevent deformities in a client with rheumatoid arthritis. Which intervention should be alternated with periods of rest?

1. Active exercise
2. Passive massage
3. Bracing of joints
4. Isometric exercises

639. A regimen of rest, exercise, and physical therapy is ordered for a client with rheumatoid arthritis. What should the nurse explain is the intended purpose of this regimen?

1. Prevent arthritic pain
2. Halt the inflammatory process
3. Help prevent the crippling effects of the disease
4. Provide for the return of joint motion after prolonged loss

640. A nurse is completing the health history of a client admitted to the hospital with osteoarthritis. Which joints does the nurse expect the client to report were **initially** involved? **Select all that apply.**

1. Hips
2. Knees
3. Ankles
4. Shoulders
5. Metacarpals

641. A client with rheumatoid arthritis asks the nurse why it is necessary to inject hydrocortisone into the knee joint. What reason should the nurse include in a response to this question?

1. Lubricate the joint
2. Reduce inflammation
3. Provide physiotherapy
4. Prevent ankylosis of the joint

642. What should the nurse take into consideration when planning nursing care for a client experiencing an acute episode of rheumatoid arthritis?

1. Inflammation of the synovial membrane rarely occurs.
2. Bony ankylosis of a joint is irreversible and causes immobility.
3. Complete immobility is desired during the acute phase of inflammation.
4. Redness and swelling of a joint signify irreversible damage has occurred.

643. When preparing an individualized teaching plan for a client with rheumatoid arthritis, which topic should the nurse omit from the generalized teaching plan for clients with arthritis?

1. Ulnar drift
2. Heberden nodes
3. Swan neck deformity
4. Boutonnière deformity

644. The nurse questions a client with rheumatoid arthritis about pain. When should the nurse expect the client to experience increased pain and limited movement of the joints?

1. After assistive exercise
2. When the room is cool
3. In the morning on awakening
4. When the latex fixation test is positive

645. A client who has intermittently been having painful, swollen knee and wrist joints during the past 3 months is diagnosed with rheumatoid arthritis. What type of diet

should the nurse expect the health care provider to order?

1. Salt-free, low-fiber diet
2. High-calorie, low-cholesterol diet
3. High-protein diet with minimal calcium
4. Regular diet with vitamins and minerals

646. Which medication should the nurse anticipate the health care provider will prescribe to relieve the pain experienced by a client with rheumatoid arthritis?

1. Aspirin
2. Codeine
3. Meperidine
4. Alprazolam

647. What should the nurse do to prevent deformities of the knee in a client with an exacerbation of arthritis? **Select all that apply.**

1. Encourage motion of the joint.
2. Maintain a knee brace on the leg.
3. Keep the client on a regimen of bed rest.
4. Maintain joints in functional alignment when resting.
5. Immobilize the joint with pillows until pain subsides.

648. A client with rheumatoid arthritis has severe pain and swelling of the joints in both hands. Range-of-motion exercises for this client should be:

1. passively performed by the nurse.
2. avoided if the client reports discomfort.
3. preceded by the application of heat or cold.
4. gradually increased to improve mobility and independence.

649. A client with arthritis reports receiving the following dietary suggestions over the years. Which recommendation for a daily diet should the nurse reinforce?

1. Wheat germ and yeast
2. Yogurt and blackstrap molasses
3. Multiple vitamin supplements in large doses
4. Adequate foods in a variety of different food groups

# Urinary/Reproductive Systems

(For additional questions, see Childbearing and Women's Health Nursing Review Questions with Answers and Rationales, [Chapter 28](#).)

650. When caring for a male client who is to receive chemotherapy for a cancerous condition, at which time should the nurse consider that spermatogenesis occurs?

1. At the time of puberty
2. At any time after birth
3. Immediately following birth
4. During embryonic development

651. A nurse is caring for a client with an undescended testicle. The nurse teaches the client that the main reason why the testicles are suspended in the scrotum is to:

1. protect the sperm from the acidity of urine.
2. facilitate the passage of sperm through the urethra.
3. protect the sperm from high abdominal temperatures.
4. facilitate their maturation during embryonic development.

652. A client is admitted to the hospital with a tentative diagnosis of urinary retention related to benign prostatic hyperplasia. There is a secondary diagnosis of delirium related to urosepsis. The health care provider prescribes the insertion of an indwelling urinary retention catheter. What nursing action is **most** important for this client's safety?

1. Secure an order for wrist restraints.
2. Orient the client to time, place, and person.
3. Involve family members in the client's care.
4. Determine if any unsafe behavior patterns exist.

653. A nurse is caring for a client with a diagnosis of cancer of the prostate. Which serum level should the nurse teach the client to have monitored to follow the course of the disease?

1. Serum creatinine
2. Blood urea nitrogen
3. Nonprotein nitrogen
4. Prostate-specific antigen

654. A nurse is caring for a client with a diagnosis of benign prostatic hyperplasia (BPH). Which information about this condition is important for the nurse to consider when caring for this client?

1. It is a congenital abnormality.
2. A malignancy usually results.
3. It predisposes to hydronephrosis.
4. An increase in the acid phosphatase level occurs.

655. A nurse is caring for a male client who is scheduled for a dilation of the urethra. Which structure surrounding the male urethra should the nurse include in a teaching program when explaining the procedure?

1. Epididymis
2. Prostate gland

3. Seminal vesicle
4. Bulbourethral gland

656. A nurse is counseling a woman who had recurrent urinary tract infections. What factor should the nurse explain is the reason why women are at a greater risk than men for contracting a urinary tract infection?

1. Altered urinary pH
2. Hormonal secretions
3. Juxtaposition of the bladder
4. Proximity of the urethra to the anus

657. A routine urinalysis is ordered for a client. What should the nurse do if the specimen cannot be sent immediately to the laboratory?

1. Take no special action.
2. Refrigerate the specimen.
3. Store it in the dirty utility room and send it later.
4. Discard the specimen and collect another specimen later.

658. A client with a urinary retention catheter reports discomfort in the bladder and urethra. What should the nurse do **first**?

1. Milk the tubing gently.
2. Notify the health care provider.
3. Check the patency of the catheter.
4. Irrigate the catheter with prescribed solutions.

659. A client experiences difficulty in voiding after an indwelling urinary catheter is removed. To what does the nurse determine that this is **most** probably related?

1. Fluid imbalance
2. Sedentary lifestyle
3. Interruption in previous voiding habits
4. Nervous tension following the procedure

660. A client with urge incontinence is receiving oxybutynin (Ditropan XL) 30 mg orally. Each tablet contains 5 mg. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

661. A client with cancer of the prostate requests the urinal at frequent intervals but either does not void or voids in very small amounts. What does the nurse conclude is **most** likely the causative factor?

1. Edema
2. Dysuria
3. Retention
4. Suppression

662. Which nursing action can **best** prevent infection from a urinary retention catheter?

1. Cleansing the perineum
2. Encouraging adequate fluids
3. Irrigating the catheter once daily
4. Cleansing around the meatus routinely

663. A nurse is caring for a client with a continuous bladder irrigation. Which is the **most** important nursing action?

1. Monitoring urinary specific gravity to determine hydration
2. Subtracting irrigant from output to determine urine volume
3. Recording urinary output every hour to determine kidney function
4. Obtaining a twenty-four-hour urine specimen to determine urine concentration

664. A nurse is providing client teaching to a woman who has recurrent urinary tract infections. Which information should the nurse include concerning the reason why women are more susceptible to urinary tract infections than men?

1. Inadequate fluid intake
2. Poor hygienic practices
3. The length of the urethra
4. The continuity of mucous membranes

665. A client in a nursing home is diagnosed with urethritis. What should the nurse plan to do before initiating antibiotic therapy prescribed by the health care provider?

1. Prepare for urinary catheterization.
2. Teach how to perform perineal care.
3. Start a twenty-four-hour urine collection.
4. Obtain a urine specimen for culture and sensitivity.

666. A nurse is assessing the urine of a client with a urinary tract infection. For which characteristic should the nurse assess each specimen of urine?

1. Clarity
2. Viscosity
3. Glucose level
4. Specific gravity

667. Nitrofurantoin (Macrobid) 0.1 gm is prescribed for a client with a urinary tract infection. Each tablet contains 50 mg. How many tablets should the nurse administer?

**Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

668. A nurse is caring for a client with glomerulonephritis. What should the nurse instruct the client to do to prevent recurrent attacks?

1. Take showers instead of tub baths.
2. Continue the same restrictions on fluid intake.
3. Avoid situations that involve physical activity.
4. Seek early treatment for respiratory tract infections.

669. A nurse is caring for a client who is admitted with ureteral colic and hematuria. The client also has stage 1 hypertension and is overweight. The decrease of which clinical indicator associated with this client's status should the nurse be **most** concerned about at this time?

1. Pain
2. Weight
3. Hematuria
4. Hypertension

▶670. A nurse is caring for a client with a ureteral calculus. Which are the **most** important nursing actions? **Select all that apply.**

1. Limiting fluid intake at night
2. Monitoring intake and output
3. Straining the urine at each voiding
4. Recording the client's blood pressure
5. Administering the prescribed analgesic

▶671. The pathology report states that a client's urinary calculus is composed of uric acid. Which nutrients should the nurse instruct the client to avoid? **Select all that apply.**

1. Eggs
2. Fruit
3. Organ meats
4. Meat extracts
5. Raw vegetables

672. A lithotripsy to break up renal calculi is unsuccessful, and a nephrolithotomy is performed. Which postoperative clinical indicator should the nurse report to the health care provider?

1. Passage of pink-tinged urine
2. Pink drainage on the dressing
3. Intake of 1750 mL in 24 hours
4. Urine output of 20 to 30 mL/hr

▶673.

### **Health Care Provider Orders**

Morphine 4 mg IV every 4 hours for severe pain prn

Ketorolac (Toradol) 15 IM every 6 hours for mild to moderate pain prn

Ondansetron (Zofran) 4 mg IVPB every 6 hours for nausea prn

Strain all urine through gauze

Encourage oral fluid intake

Urine C/S

Ciprofloxacin (Cipro) 400 mg every 12 hours IVPB

IV 0.9% NaCl 150 mL per hour for 3 liters

### **Emergency Department Discharge Note**

1125: Client admitted to the Emergency Department at 0700 reporting unbearable pain of 10 on a 1 to 10 pain scale radiating down into the groin. Medicated with 6 mg of morphine IV at 0730. Client reported pain relief on a level 3. Bladder and pelvic ultrasound and abdominal and pelvic CT scan without contrast indicate 5 mm obstructing stone in left proximal ureter with mild hydronephrosis. Urinalysis reveals: positive nitrite, blood, and leukocyte esterase; 10 to 20 RBCs; 25 to 50 WBC; few squamous epithelial cells; and moderate bacteria. C&S is pending. Client admitted for further management.

### **Nursing Assessment of Client on Admission to Unit**

1130: Client splinting abdomen and stated, "I have excruciating, horrendous, wave-like pain on the left side of my belly moving down to my groin, and I feel like I am going to throw up. I can't stand it." Client asked for the bedpan and voided 50 ml of pink-tinged urine.

A client is admitted to the hospital from the emergency department with a diagnosis of urolithiasis. The nurse reviews the client's clinical record and performs an admission assessment. What is the **priority** nursing action?

1. Strain the client's urine.
2. Administer the prescribed morphine.
3. Position in the high-Fowler position.
4. Collect a urine specimen for culture and sensitivity.

674. A nurse is caring for a client with a diagnosis of renal calculi of calcium phosphate composition. Which type of diet should the nurse explore with the client when providing discharge information?

1. Low purine
2. Low calcium
3. High phosphorus
4. High alkaline ash

675. A pathology report states that a client's urinary calculus is composed of uric acid. Which should the nurse instruct the client to avoid?

1. Milk
2. Liver
3. Cheese
4. Vegetables

676. A nurse is caring for a client with end-stage renal disease. Which clinical indicators of end-stage renal disease should the nurse expect? **Select all that apply.**

1. Polyuria
2. Jaundice
3. Azotemia
4. Hypertension
5. Polycythemia

677. A client has a heminephrectomy and returns from the postanesthesia care unit with a nephrostomy tube and an indwelling urinary catheter. The client's urinary output is 50 mL/hr. What is the nurse's **next** action?

1. Record the findings.
2. Irrigate the nephrostomy tube.
3. Encourage the intake of oral fluids.
4. Notify the health care provider immediately.

678. A client is diagnosed with bladder cancer, and a cystectomy and an ileal conduit are scheduled. What should the nurse plan to do preoperatively?

1. Limit fluid intake for twenty-four hours.
2. Teach range-of-motion and Kegel exercises.
3. Explain the procedure for irrigating the ileal conduit.
4. Administer cleansing enemas and laxatives as ordered.

679. A nurse is caring for a client after surgical creation of a conduit diversion. What is the major disadvantage of a conduit diversion that the nurse should consider when caring for this client?

1. Peristalsis is greatly decreased.
2. Stool continuously oozes from it.
3. Urine continuously drains from it.
4. Absorption of nutrients is diminished.

680. After a nephrectomy a client arrives in the postanesthesia care unit in the supine position. Which action should be employed by the nurse to assess the client for signs of hemorrhage?

1. Turn the client to observe the dressings.
2. Press the client's nail beds to assess capillary refill.
3. Observe the client for hemoptysis when suctioning.
4. Monitor the client's blood pressure for a rapid increase.

681. A client had a suprapubic prostatectomy. Which type of tube can the nurse expect the client to have when he returns to his room from the postanesthesia care unit?

1. Cystostomy

2. Nasogastric
3. Nephrostomy
4. Ureterostomy

682. A client who had a suprapubic prostatectomy returns from the postanesthesia care unit and accidentally pulls out the urethral catheter. What should the nurse do **first**?

1. Reinsert a new catheter.
2. Notify the health care provider.
3. Check for bleeding by irrigating the suprapubic tube.
4. Take no immediate action if the suprapubic tube is draining.

683. A nurse is caring for a client with an indwelling urinary catheter. What is the **most** important action for the nurse to implement when irrigating the bladder?

1. Use sterile equipment.
2. Instill the fluid under high pressure.
3. Warm the solution to body temperature.
4. Aspirate immediately to ensure return flow.

684. What should the nurse do to obtain an accurate urine output for a client with a continuous bladder irrigation (CBI)?

1. Measure the contents of the bedside drainage bag.
2. Stop the irrigation and determine the urine output.
3. Subtract the volume of irrigant from the total drainage.
4. Ensure the urine and irrigant drain into two separate bags.

685. A nurse is assessing a client with a diagnosis of kidney failure for clinical indicators of metabolic acidosis. What should the nurse conclude is the reason why metabolic acidosis develops with kidney failure?

1. Inability of the renal tubules to secrete hydrogen ions and conserve bicarbonate
2. Depressed respiratory rate by metabolic wastes, causing carbon dioxide retention
3. Inability of the renal tubules to reabsorb water to dilute the acid contents of blood
4. Impaired glomerular filtration, causing retention of sodium and metabolic waste products

686. A nurse is caring for a client with acute kidney failure who is receiving a protein restricted diet. The client asks why this diet is necessary. What information should the nurse include in a response to the client's questions?

1. A high-protein intake ensures an adequate daily supply of amino acids to compensate for losses.
2. Essential and nonessential amino acids are necessary in the diet to supply materials for tissue protein synthesis.
3. This supplies only essential amino acids, reducing the amount of metabolic waste products, thus decreasing stress on the kidneys.
4. Urea nitrogen cannot be used to synthesize amino acids in the body, so the nitrogen for amino acid synthesis must come from the dietary protein.

687. A client with acute kidney failure states, "Why am I twitching and my fingers and toes tingling?" The nurse should respond, "This is caused by:

1. acidosis."

- 2. calcium depletion.”
- 3. potassium retention.”
- 4. sodium chloride depletion.”

688. A client with acute kidney failure becomes confused and irritable. Which does the nurse determine is the **most** likely cause of this behavior?

- 1. Hyperkalemia
- 2. Hybernatriemia
- 3. A limited fluid intake
- 4. An increased blood urea nitrogen level

689. A nurse is caring for a client with chronic kidney failure. Which clinical findings should the nurse expect when assessing this client? **Select all that apply.**

- 1. Polyuria
- 2. Lethargy
- 3. Hypotension
- 4. Muscle twitching
- 5. Respiratory acidosis

690. A student nurse is caring for a client with chronic kidney failure who is to be treated with continuous ambulatory peritoneal dialysis (CAPD). Which statement by the student nurse indicates to the primary nurse that the student nurse understands the purpose of this therapy?

- 1. “It provides continuous contact of dialyzer and blood to clear toxins by ultrafiltration.”
- 2. “It exchanges and cleanses blood by correction of electrolytes and excretion of creatinine.”
- 3. “It decreases the need for immobility because it clears toxins in short and intermittent periods.”
- 4. “It uses the peritoneum as a semipermeable membrane to clear toxins by osmosis and diffusion.”

691. A nurse is evaluating a client’s understanding of peritoneal dialysis. Which information in the client’s response indicates an understanding of the purpose of the procedure?

- 1. Reestablish kidney function
- 2. Clean the peritoneal membrane
- 3. Provide fluid for intracellular spaces
- 4. Remove toxins in addition to other metabolic wastes

692. A nurse is caring for a client with a diagnosis of chronic kidney failure who has just been told by the health care provider that hemodialysis is necessary. Which clinical manifestation indicates the need for hemodialysis?

- 1. Ascites
- 2. Acidosis
- 3. Hypertension
- 4. Hyperkalemia

693. When receiving hemodialysis, the complication of the removal of too much sodium may occur. For which clinical findings associated with hyponatremia should the nurse

assess the client? **Select all that apply.**

1. Chvostek sign
2. Muscle cramps
3. Extreme fatigue
4. Cardiac dysrhythmias
5. Increased temperature

694.▶ A nurse is caring for a client with end-stage renal disease who has a mature arteriovenous (AV) fistula. What nursing care should be included in the client's plan of care? **Select all that apply.**

1. Auscultate for a bruit
2. Palpate the site to identify a thrill
3. Irrigate with saline to maintain patency
4. Avoid drawing blood from the affected extremity
5. Keep the fistula clamped until ready to perform dialysis

695. A client is to have hemodialysis. What must the nurse do before this treatment?

1. Obtain a urine specimen to evaluate kidney function
2. Weigh the client to establish a baseline for later comparison
3. Administer medications that are scheduled to be given within the next hour
4. Explain that the peritoneum serves as a semipermeable membrane to remove wastes

696. When assessing a client during peritoneal dialysis, a nurse observes that drainage of the dialysate from the peritoneal cavity has ceased before the required volume has returned. What should the nurse instruct the client to do?

1. Drink a glass of water.
2. Turn from side to side.
3. Deep breathe and cough.
4. Rotate the catheter periodically.

697. A client with an invasive carcinoma of the bladder is receiving radiation to the lower abdomen in an attempt to shrink the tumor before surgery. What should the nurse do considering the side effects of radiation?

1. Observe feces for the presence of blood.
2. Monitor the blood pressure for hypertension.
3. Administer enemas to remove sloughing tissue.
4. Provide a high-bulk diet to prevent constipation.

698. During the postoperative period after surgery for a kidney transplant, the client's creatinine level is 3.1 mg/dL. What should the nurse do **first** in response to this laboratory result?

1. Notify the health care provider.
2. Check the intravenous infusion.
3. Obtain current blood test results.
4. Assess for decreased urine output.

# Infectious Diseases

699. A client is concerned about contracting malaria while visiting relatives in Southeast Asia. What should the nurse teach the client to avoid to **best** prevent malaria?

1. Mosquito bites
2. Untreated water
3. Undercooked food
4. Overpopulated areas

700. A nurse is reviewing the physical examination and laboratory tests of a client with malaria. For which important clinical indicators should the nurse be alert when reviewing data about this client? **Select all that apply.**

1. Polyuria
2. Leukopenia
3. Hyperthermia
4. Splenomegaly
5. Erythrocytosis

701. Which action should the nurse take when caring for a client with malaria?

1. Institute seizure precautions.
2. Prepare for blood transfusions.
3. Maintain isolation precautions.
4. Provide nutrition between paroxysms.

702. A nurse is teaching a client about drug therapy against *Plasmodium falciparum*. What information should the nurse include in the teaching plan?

1. The infection can be controlled.
2. Immunity will prevent reinfestation.
3. The infection generally can be eliminated.
4. Immunity from the original infection is temporary.

703. Blackwater fever occurs in some clients with malaria. For which response should the nurse assess this client?

1. Dark red urine
2. Low grade fever
3. Clay-colored diarrhea
4. Coffee-ground emesis

704. A client who abused intravenous drugs was diagnosed with the human immunodeficiency virus (HIV) several years ago. The nurse explains that the diagnostic criterion for acquired immunodeficiency syndrome (AIDS) has been met when the client:

1. contracts HIV-specific antibodies.
2. develops an acute retroviral syndrome.
3. is capable of transmitting the virus to others.
4. has a CD4<sup>+</sup> T lymphocyte level of less than 200 cells/μL.

705. A nurse is caring for a client who is HIV positive. For which complication associated with this diagnosis is it **most** important for the nurse to teach prevention strategies?

1. Infection

2. Depression
3. Social isolation
4. Kaposi sarcoma

706. A mother with the diagnosis of AIDS states that she has been caring for her baby even though she has not been feeling well. What important information should the nurse determine?

1. If she has kissed the baby
2. If the baby is breastfeeding
3. When the baby last received antibiotics
4. How long she has been caring for the baby

707. A nurse is caring for a client with a diagnosis of AIDS. The IV infiltrates and needs to be restarted. What is necessary to protect the nurse when restarting the IV? **Select all that apply.**

1. Mask
2. Gown
3. Gloves
4. Face shield
5. Hand hygiene

708. A nurse is planning to provide discharge teaching to the family of a client with AIDS. Which statement should the nurse include in the teaching plan?

1. "Wash used dishes in hot, soapy water."
2. "Let dishes soak in hot water for 24 hours before washing."
3. "You should boil the client's dishes for 30 minutes after use."
4. "Have the client eat from paper plates so they can be discarded."

709. During an AIDS education class a client states, "Vaseline works great when I use condoms." Which conclusion about the client's knowledge of condom use can the nurse draw from this statement?

1. An understanding of safer sex
2. An ability to assume self-responsibility
3. Ignorance related to correct condom use
4. Ignorance concerning the transmission of HIV

710. A client is diagnosed with gastroenteritis. What does the nurse determine is the basic intention underlying the unique dietary management for this client?

1. Provide optimal amounts of all important nutrients.
2. Increase the amount of bulk and roughage in the diet.
3. Eliminate chemical, mechanical, and thermal irritation.
4. Promote psychologic support by offering a wide variety of foods.

711. A nurse is caring for a client who had *Clostridium welchii* (*Clostridium perfringens*) cultured from a wound of the lower extremity. Which disease results when this organism enters a wound, causing crepitus?

1. Tetanus
2. Anthrax
3. Botulism

#### 4. Gangrene

712. A client in the emergency department states, "I was bitten by a raccoon while I was fixing a water pipe in the crawl space of my basement." Which is the **most** effective first-aid treatment for the nurse to use for this client?

1. Administering an antivenin
2. Maintaining a pressure dressing
3. Cleansing the wound with soap and water
4. Applying a tourniquet proximal to the wound

713. A nurse in a public health clinic is teaching clients how to prevent toxoplasmosis. What should the nurse instruct the clients to avoid?

1. Contact with cat feces
2. Working with heavy metals
3. Ingestion of freshwater fish
4. Excessive radiation exposure

714. A client is admitted with the diagnosis of tetanus. For which clinical indicators should the nurse assess the client? **Select all that apply.**

1. Restlessness
2. Muscular rigidity
3. Atony of facial muscles
4. Respiratory tract spasms
5. Spastic voluntary muscle contractions

715. A client is suspected of having rabies after being bitten by a raccoon. For which clinical indicators should the nurse assess the client? **Select all that apply.**

1. Diarrhea
2. Forgetfulness
3. Urinary stasis
4. Nuchal rigidity
5. Pharyngeal spasm

716. A client is admitted to the hospital for general paresis as a complication of syphilis. Which therapy should the nurse anticipate will **most** likely be prescribed for this client?

1. Penicillin therapy
2. Major tranquilizers
3. Behavior modification
4. Electroconvulsive therapy

717. A nurse is counseling a client who has gonorrhea. What additional fact about gonorrhea, besides the fact that it is highly infectious, should the nurse teach this client?

1. It is easily cured.
2. It occurs very rarely.
3. It can produce sterility.
4. It is limited to the external genitalia.

718. A female client is upset with her diagnosis of gonorrhea and asks the nurse, "What can I do to prevent getting another infection in the future?" The nurse evaluates that the teaching is understood when the client states, "My **best** protection is to:

1. douche after every intercourse."
2. avoid engaging in sexual behavior."
3. insist that my partner use a condom."
4. use a spermicidal cream with intercourse."

719. A nurse is caring for a client with a diagnosis of acute salpingitis. Which condition **most** commonly causing inflammation of the fallopian tubes should the nurse include when planning a teaching program for this client?

1. Syphilis
2. Gonorrhea
3. Hydatidiform mole
4. Spontaneous abortion

720. A client is diagnosed with herpes genitalis. What should the nurse do to prevent cross-contamination?

1. Institute droplet precautions.
2. Arrange transfer to a private room.
3. Wear a gown and gloves when giving direct care.
4. Close the door and wear a mask when in the room.

721. Which prescribed medication should the nurse expect to administer to a female client who exhibits the genital lesions presented in the illustration at the right?

1. Zidovudine (Retrovir)
2. Metronidazole (Flagyl)
3. Ceftriaxone (Rocephin)

4. Acyclovir sodium (Zovirax)

722. A client cannot understand how syphilis was contracted because there has been no sexual activity for several days. Which length of time associated with the incubation of syphilis should the nurse include in the teaching plan?

1. 1 week
2. 4 months
3. 2 to 6 weeks
4. 48 to 72 hours

723. A nurse is preparing a teaching plan for a client with syphilis. The nurse includes that syphilis is not considered contagious in the:

1. tertiary stage.
2. primary stage.
3. secondary stage.
4. incubation stage.

724. A nurse is concerned about the public health implications of gonorrhea diagnosed in a 16-year-old adolescent. Which should be of **most** concern to the nurse?

1. Finding the client's contacts
2. Interviewing the client's parents
3. Instructing the client about birth control measures
4. Determining the reasons for the client's promiscuity

725. A nurse is teaching a client about drug therapy for gonorrhea. Which fact about drug therapy should the nurse emphasize?

1. Cures the infection
2. Prevents complications
3. Controls its transmission
4. Reverses pathologic changes

# Drug-Related

726. A nurse is assessing the therapeutic action of drugs classified as tumor necrosis factor inhibitors. What client response indicates to the nurse that a drug with this classification is effective?

1. Continued remission in a client with ovarian cancer
2. Increased insulin production in a client with diabetes mellitus
3. Vasodilation of coronary arteries in a client with ischemic heart disease
4. Reduction of inflammatory joint pain in a client with rheumatoid arthritis

727. What effect of povidone-iodine (Betadine) does a nurse consider when using it on the client's skin before obtaining a specimen for a blood culture?

1. Makes the skin more supple
2. Avoids drying the skin as does alcohol
3. Eliminates surface bacteria that may contaminate the culture
4. Provides a cooling agent to diminish the feeling from the puncture wound

728. Which drug does a nurse anticipate may be prescribed to produce diuresis and inhibit formation of aqueous humor for a client with glaucoma?

1. Chlorothiazide (Diuril)
2. Acetazolamide (Diamox)
3. Bendroflumethiazide (Naturetin)
4. Demecarium bromide (Humorsol)

729. A client reports fatigue and dyspnea and appears pale. The nurse questions the client about medications currently being taken. In light of the symptoms, which medication causes the nurse to be **most** concerned?

1. Famotidine (Pepcid)
2. Methyldopa (Aldomet)
3. Ferrous sulfate (Feosol)
4. Levothyroxine (Synthroid)

730. Which drug requires the nurse to monitor the client for signs of hyperkalemia?

1. Furosemide (Lasix)
2. Metolazone (Zaroxolyn)
3. Spironolactone (Aldactone)
4. Hydrochlorothiazide (HydroDIURIL)

731. A client is receiving albuterol (Proventil) to relieve severe asthma. For which clinical indicators should the nurse monitor the client? **Select all that apply.**

1. Tremors
2. Lethargy
3. Palpitations
4. Visual disturbances
5. Decreased pulse rate

732. In the postanesthesia care unit it is reported that the client received intrathecal morphine intraoperatively to control pain. Considering the administration of this medication, what should the nurse include as part of the client's **initial** 24-hour

postoperative care?

1. Assessing the client for tachycardia
2. Monitoring of respiratory rate hourly
3. Administering naloxone every 3 to 4 hours
4. Observing the client for signs of CNS excitement

733. What should the nurse include in a teaching plan to help reduce the side effects associated with diltiazem (Cardizem)?

1. Lie down after meals.
2. Change positions slowly.
3. Avoid dairy products in diet.
4. Take the drug with an antacid.

734. A nurse is providing discharge instructions for a client with angina who has a prescription for sublingual nitroglycerin tablets. The nurse should teach the client that the nitroglycerin sublingual tablets have lost their potency when:

1. sublingual tingling is experienced.
2. the tablets are more than three months old.
3. the pain is unrelieved, but facial flushing is increased.
4. onset of relief is delayed, but the duration of relief is unchanged.

735. What should the nurse expect the health care provider to prescribe if a client exhibits clinical indicators of warfarin (Coumadin) overdose?

1. Heparin
2. Vitamin K
3. Iron dextran
4. Protamine sulfate

736. Metoprolol (Lopressor) is prescribed for a client. The nurse should question the prescription if the client has which diagnosis?

1. Hypertension
2. Angina pectoris
3. Sinus bradycardia
4. Myocardial infarction

737. Which client's health problem motivates the nurse to question a prescription for a beta blocker?

1. Heart failure
2. Hypertension
3. Sinus tachycardia
4. Coronary artery disease

738. A nurse concludes that the simvastatin (Zocor) being administered to a client is effective. A decrease in what clinical finding supports this conclusion?

1. INR
2. Heart rate
3. Triglycerides
4. Blood pressure

739. A client with a history of arthritis has an acute episode of right ventricular heart

failure and is receiving furosemide (Lasix). The health care provider lowers the client's usual dosage of aspirin. The client asks the nurse the reason for the lower dose. What is the nurse's **best** response?

1. "Aspirin accelerates metabolism of furosemide and decreases the diuretic effect."
2. "Aspirin in large doses after an acute stress episode increases the bleeding potential."
3. "Competition for renal excretion sites by the drugs causes increased serum levels of aspirin."
4. "Use of furosemide and aspirin concomitantly increases formation of uric acid crystals in the nephron."

740. What instructions should a nurse give a client for whom nitroglycerin tablets are prescribed?

1. Limit the number of tablets to four per day.
2. Discontinue the medication if a headache develops.
3. Ensure that the medication is stored in a dark container.
4. Increase the number of tablets if dizziness is experienced.

741. A nurse is taking the health history of a client who is to have surgery in 1 week. The nurse identifies that the client is taking ibuprofen (Advil) for discomfort associated with osteoarthritis and notifies the health care provider. Which drug does the nurse expect will **most** likely be prescribed instead of the Advil?

1. Naproxen (Aleve)
2. Ibuprofen (Motrin)
3. Ketorolac (Toradol)
4. Acetaminophen (Tylenol)

742. A client who is obtund has a blood pressure of 80/35 mm Hg after a blood transfusion. In an effort to support renal perfusion, the nurse administers DOPamine (Intropin) at 2 mcg/kg/min as prescribed. What is the **most** relevant outcome indicating effectiveness of the medication for this client?

1. A decrease in blood pressure
2. An increase in urinary output
3. A decrease in core temperature
4. An increase in level of consciousness

743. A nurse identifies that a client receiving chemotherapy has lost weight. What are appropriate nursing interventions for this client? **Select all that apply.**

1. Providing low-carbohydrate meals
2. Explaining the effect of chemotherapy
3. Encouraging the intake of preferred foods
4. Promoting the intake of small, frequent meals
5. Administering ordered antiemetics before meals

744. Ibuprofen (Motrin) and hydroxychloroquine (Plaquenil) are prescribed for an older client with arthritis. The nurse teaches the client about these medications. What responses to the medication should the client be taught to report? **Select all that apply.**

1. Blurred vision
2. Urinary retention

3. Bleeding tendencies
4. Difficulty swallowing
5. Feelings of irritability

745. One week after being hospitalized for an acute myocardial infarction, a client reports a loss of appetite and feeling nauseated. Which of the client's prescribed medications should be withheld and the health care provider notified?

1. Digoxin (Lanoxin)
2. Furosemide (Lasix)
3. Propranolol (Inderal)
4. Spironolactone (Aldactone)

746. For which side effects should a nurse assess a client with cancer who is being treated with chemotherapeutic agents? **Select all that apply.**

1. Diarrhea
2. Leukocytosis
3. Bleeding tendencies
4. Lowered sedimentation rate
5. Increased hemoglobin levels

747. A nurse is providing discharge instructions about digoxin (Lanoxin). Which response should a nurse include as a reason for a client to withhold the digoxin?

1. Chest pain
2. Blurred vision
3. Persistent hiccups
4. Increased urinary output

748. For what client response must the nurse monitor to determine the effectiveness of amiodarone (Cordarone)?

1. Results of fasting lipid profile
2. Presence of cardiac dysrhythmias
3. Degree of blood pressure control
4. Incidence of ischemic chest pain

749. The laboratory INR results of a client receiving warfarin (Coumadin) have been variable. The nurse interviews the client to determine factors contributing to the problem. Which is **most** important for the nurse to identify?

1. Use of analgesics
2. Serum glucose level
3. Serum potassium levels
4. Adherence to the prescribed drug regimen

750. Warfarin (Coumadin) is prescribed for a client who has been receiving IV heparin for a partial occlusion of the left common carotid artery. The client expresses concern about why both drugs are needed at the same time. The nurse explains that this approach:

1. allows clot dissolution while preventing new clot formation.
2. permits the administration of smaller doses of each medication.
3. immediately provides maximum protection against clot formation.

4. provides an anticoagulant intravenously until the oral drug reaches therapeutic levels.
751. A client with a partial occlusion of the left common carotid artery is to be discharged while still receiving warfarin (Coumadin). Which clinical adverse effect should the nurse identify as a reason for the client to seek medical consultation?
1. Presence of blood in urine
  2. Increased swelling of the ankles
  3. Diminished ability to concentrate
  4. Occurrence of transient ischemic attacks
752. A client is receiving warfarin (Coumadin) for a pulmonary embolism. Which drug is contraindicated when taking warfarin?
1. Ferrous sulfate
  2. Acetylsalicylic acid
  3. Atenolol (Tenormin)
  4. ChlorproMAZINE (Thorazine)
753. Tissue plasminogen activator (t-PA) is to be administered to a client in the emergency department. Which is the **priority** nursing assessment?
1. Apical pulse rate
  2. Electrolyte levels
  3. Signs of bleeding
  4. Tissue compatibility
754. A client with tuberculosis asks the nurse why vitamin B<sub>6</sub> (pyridoxine) is given with isoniazid (INH). What explanation should the nurse provide?
1. "It will improve your immunologic defenses."
  2. "The tuberculostatic effect of isoniazid is enhanced."
  3. "Isoniazid interferes with the synthesis of this vitamin."
  4. "Destruction of the tuberculosis organisms is accelerated."
755. A client receiving morphine is being monitored by the nurse for signs and symptoms of overdose. Which clinical findings support a conclusion of overdose? **Select all that apply.**
1. Polyuria
  2. Lethargy
  3. Bradycardia
  4. Dilated pupils
  5. Slow respirations
756. Which medication should the nurse anticipate will be prescribed to relieve anxiety and apprehension in a client with pulmonary edema?
1. Morphine
  2. Phenobarbital
  3. HydrOXYzine
  4. Chloral hydrate
757. Some clients self-prescribe over-the-counter glucosamine to help relieve joint pain and stiffness. Which condition should the nurse identify as a reason for a client to reconsider taking this medication?

1. Osteoarthritis
2. Heart disease
3. Hyperthyroidism
4. Diabetes mellitus

758. Carbidopa/levodopa (Sinemet) is prescribed for a client with Parkinson disease. What should the nurse teach the client about this medication?

1. "Take this medication between meals."
2. "Blood levels of the drug should be monitored weekly."
3. "It can cause happy feelings followed by feelings of depression."
4. "You may experience dizziness when moving from sitting to standing."

759. A nurse is providing instructions for a client who is receiving phenytoin (Dilantin) but has limited access to health care. What side effect is the basis for the nurse's emphasis on meticulous oral hygiene?

1. Hyperplasia of the gums
2. Alkalinity of the oral secretions
3. Irritation of the gingiva and destruction of tooth enamel
4. Promotion of plaque and bacterial growth at the gum lines

760. The nurse explains to the family of a client suspected of having myasthenia gravis that edrophonium (Enlon) is used to establish the diagnosis. An increase in which factor will confirm the diagnosis?

1. Symptoms
2. Consciousness
3. Blood pressure
4. Muscle strength

761. A client is receiving phenytoin (Dilantin) for a seizure disorder and heparin for a deep vein thrombosis. Warfarin (Coumadin) is added in preparation for discontinuing the heparin. Why must the nurse observe the client closely during the **initial** days of treatment with Coumadin?

1. Warfarin affects the metabolism of phenytoin.
2. Phenytoin decreases warfarin's anticoagulant effect.
3. Warfarin's action is greater in clients with seizure disorders.
4. Seizures increase the metabolic degradation rate of warfarin.

762. A client who is receiving phenytoin (Dilantin) asks why folic acid (Folate) was prescribed. What is the **best** explanation by the nurse?

1. Absorption from foods is inhibited.
2. The action of phenytoin is potentiated.
3. Absorption of iron from foods is improved.
4. Neuropathy caused by phenytoin is prevented.

763. What should the nurse monitor to evaluate the effectiveness of carbamazepine (Tegretol) in the management of a client's trigeminal neuralgia?

1. Pain intensity
2. Liver function
3. Cardiac output

#### 4. Seizure activity

764. Ceftriaxone (Rocephin) 2.5 g IVPB every 8 hours is prescribed for a client with a severe infection. The pharmacy sends a vial labeled 5 g per 10 mL. What volume of ceftriaxone should the nurse add to the IVPB solution? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

765. A nurse is caring for a client after a total knee replacement who is requesting Vicodin in addition to the patient-controlled analgesia (PCA). The client reports having taken 2 Vicodin tablets every 4 hours for several weeks before surgery. If each tablet contains 500 mg of acetaminophen, how much acetaminophen had the client been ingesting per day? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mg

766. A health care provider prescribes 500 mg of an antibiotic IVPB every 12 hours. The vial of antibiotic contains 1 g and indicates that the addition of 2.5 mL of sterile water will yield 3 mL of reconstituted solution. How many milliliters of the antibiotic should be added to the 50 mL IVPB bag? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

767. A client is to have mafenide (Sulfamylon) cream applied to burned areas. For which serious side effect of mafenide therapy should the nurse monitor this client?

1. Curling ulcer
2. Renal shutdown
3. Metabolic acidosis
4. Hemolysis of red blood cells

768. After several days of IV therapy for chloroquine-resistant malaria, the health care provider replaces the IV medication with oral quinine, 2 g per day in divided doses. The nurse advises the client to take this medication after meals to:

1. delay its absorption.
2. minimize gastric irritation.
3. decrease stimulation of appetite.
4. reduce its antidysrhythmic action.

769. Preparation of a client for a subtotal thyroidectomy may include the administration of potassium iodide solution. The client refuses to take the medication. What explanation should the nurse give as to why this medication should be taken?

1. The metabolic rate of the body will increase.
2. It will reduce the risk of hemorrhage during surgery.
3. It will maintain the functioning of the parathyroid glands.
4. The amount of thyroid hormones being secreted will decrease.

770. What information should the nurse include when teaching a client about antacid tablets?

1. Take them at 4-hour intervals.
2. Take them 1 hour before meals.
3. They are as effective as the liquid forms.
4. They interfere with the absorption of other drugs.

771. A client who has been diagnosed with Lyme disease is started on doxycycline (Vibramycin) as part of the therapy. What should the nurse do when administering this drug?

1. Administer the medication with meals or a snack.
2. Provide orange or other citrus fruit juice with the medication.
3. Give the medication an hour before milk products are ingested.
4. Offer antacids thirty minutes after administration if GI side effects occur.

772. An ambulatory female client with relapsing-remitting multiple sclerosis is to receive every-other-day injections of interferon beta-1a (Avonex). What adverse effects should the nurse explain may occur when taking this medication? **Select all that apply.**

1. Depression
2. Constipation
3. Flulike symptoms
4. Increased heart rate
5. Decreased perspiration

773. Hydrocortisone (Cortef) is prescribed for a client with Addison disease. Before discharge, the nurse teaches the client about this medication. What did the nurse include as a therapeutic effect of the drug?

1. Supports a better response to stress
2. Promotes a decrease in blood pressure
3. Decreases episodes of shortness of breath
4. Controls an excessive loss of potassium from the body

774. A nurse administers the drug desmopressin acetate (DDAVP) to a client with diabetes insipidus. What should the nurse monitor to evaluate the effectiveness of the drug?

1. Arterial blood pH
2. Intake and output
3. Fasting serum glucose
4. Pulse and respiratory rates

775. A client receiving morphine by patient-controlled analgesia has a respiratory rate of 6 breaths/min. What intervention should the nurse anticipate?

1. Nasotracheal suction
2. Mechanical ventilation
3. Naloxone administration
4. Cardiopulmonary resuscitation

776. A client will be taking nitrofurantoin (Macrobid) 50 mg orally every evening at home to manage recurrent urinary tract infections. What instructions should the nurse give to the client?

1. Increase your intake of fluids.
2. Strain the urine for crystals and stones.
3. Stop the drug if your urinary output increases.
4. Maintain the exact time schedule for taking the drug.

777. Aspirin is prescribed for a client with rheumatoid arthritis. Which clinical

indicators of aspirin toxicity should the nurse teach the client to report? **Select all that apply.**

1. Nausea
2. Joint pain
3. Blood in the stool
4. Ringing in the ears
5. Increased urine output

778. What should the nurse include in a teaching plan for a client taking calcium channel blockers such as Nifedipine (Procardia)? **Select all that apply.**

1. Reduce calcium intake.
2. Change positions slowly.
3. Report peripheral edema.
4. Expect temporary hair loss.
5. Avoid drinking grapefruit juice.

779. A nurse is planning care for a client with cancer who is receiving the plant alkaloid vincristine. In contrast to the side effects of most chemotherapeutic agents, what is a common side effect of vincristine that the nurse must address in the client's care plan?

1. Nausea
2. Alopecia
3. Constipation
4. Hyperuricemia

780. A client receiving chemotherapy asks the nurse why an antibiotic was also prescribed. Which tissue affected by chemotherapy should the nurse consider when formulating a response?

1. Liver
2. Blood
3. Bone marrow
4. Lymph nodes

781. A client receiving chemotherapy for cancer develops sores in the mouth and asks the nurse why this happened. What is the nurse's **best** response?

1. "The sores occur because of the direct irritating effects of the drug."
2. "These tissues are poorly nourished because you have a decreased appetite."
3. "The rapidly dividing cells of the gastrointestinal tract are damaged by the drug."
4. "This side effect occurs because it targets the cells of the gastrointestinal system."

782. A nurse administers leucovorin calcium to a client before the prescribed methotrexate (Trexall). The client asks the reason for this. What effect of leucovorin calcium should the nurse consider when formulating a response?

1. Potentiates metabolite required for destruction of cancer cells
2. Supplies levels of folic acid required by blood-forming organs
3. Acts synergistically with antineoplastic drugs to destroy cancer cells
4. Increases production of phagocytes to help remove debris from destroyed cancer cells

783. A client with a head injury has been receiving dexamethasone (Decadron). The health care provider plans to reduce the dexamethasone (Decadron) dosage gradually

and to continue a lower maintenance dosage. Which effect associated with the gradual dosage reduction of the drug should the nurse explain to the client?

1. Builds glycogen stores in the muscles
2. Produces antibodies by the immune system
3. Allows the increased intracranial pressure to return to normal
4. Promotes return of cortisone production by the adrenal glands

784. A client with rheumatoid arthritis has been taking a steroid medication for the past year. For which complication of prolonged use of this medication should the nurse assess the client?

1. Decreased white blood cells
2. Increased C-reactive protein
3. Increased sedimentation rate
4. Decreased serum glucose levels

785. Which test result should a nurse review to determine if the antibiotic prescribed for the client will be effective?

1. Serologic test
2. Sensitivity test
3. Serum osmolality
4. Sedimentation rate

786. After receiving streptomycin sulfate for 2 weeks as part of the medical regimen for tuberculosis, the client states, "I feel like I am walking like a drunken seaman." The nurse withholds the drug and promptly reports the problem to the health care provider. Which part of the body does the nurse determine is being affected as indicated by the symptom reported by the client?

1. Pyramidal tracts
2. Cerebellar tissue
3. Peripheral motor end-plates
4. Eighth cranial nerve's vestibular branch

787. A client says, "I take baking soda in water when I get heartburn." The nurse suggests an antacid containing aluminum and magnesium hydroxide instead of baking soda. What is the advantage these antacids have over baking soda?

1. They contain little, if any, sodium.
2. Absorption by the stomach mucosa is markedly enhanced.
3. There is no direct effect on the systemic acid-base balance when taken as directed.
4. Few side effects such as diarrhea or constipation are experienced when they are used properly.

788. Famotidine (Pepcid) is prescribed for a client with peptic ulcer disease. The client asks the nurse what this medication does. The nurse responds, "It:

1. increases gastric motility."
2. neutralizes gastric acidity."
3. facilitates histamine release."
4. inhibits gastric acid secretion."

789. A terminally ill client in a hospice unit for several weeks is receiving a morphine

drip. The dose is now above the typical recommended dosage. The client's spouse tells the nurse that the client is again uncomfortable and needs the morphine increased. The prescription states to titrate the morphine to comfort level. What should the nurse do?

1. Add a placebo to the morphine to appease the spouse.
2. Discuss with the spouse the risk for morphine addiction.
3. Assess the client's pain before increasing the dose of morphine.
4. Check the client's heart rate before increasing the morphine to the next level.

790. Isoniazid (INH) is prescribed as a prophylactic measure for a client whose spouse has active TB. What statements by the client indicate that there is a need for further teaching? **Select all that apply.**

1. "I plan to start taking vitamin B<sub>6</sub> with breakfast."
2. "I'll still be taking this drug six months from now."
3. "I sometimes allow our children to sleep in our bed at night."
4. "I know I also have tuberculosis because the skin test was positive."
5. "I'll be skipping the wine but enjoying the cheese at my neighbor's party."

791. A nurse is reviewing the history and physicals of several clients from the clinic who are taking rifampin (Rifadin) for the treatment of tuberculosis. Which client presents a specific concern for the nurse?

1. 45-year-old taking a loop diuretic
2. 26-year-old taking oral contraceptives
3. 32-year-old taking a proton pump inhibitor
4. 72-year-old taking intermediate-acting insulin

792. After surgery a client develops a deep vein thrombosis and a pulmonary embolus. Heparin via a continuous drip at 1200 units/hr is prescribed. Several hours later, vancomycin (Vancocin) 500 mg intravenously every 12 hours is prescribed. The client has one IV site: a peripheral line in the left forearm. What action should the nurse take?

1. Stop the heparin, flush the line, and administer the vancomycin.
2. Use a piggyback setup to administer the vancomycin into the heparin.
3. Start another IV line for the vancomycin and continue the heparin as prescribed.
4. Hold the vancomycin and tell the health care provider that the drug is incompatible with heparin.

793. Valsartan (Diovan), an angiotensin II receptor antagonist, is prescribed for a client. For which possible side effects should the nurse monitor the client? **Select all that apply.**

1. Constipation
2. Hypokalemia
3. Irregular pulse rate
4. Change in visual acuity
5. Orthostatic hypotension

794. A female client whose ECG exhibits multiple premature ventricular complexes is to take oral disopyramide (Norpace). Which side effects should the nurse include when teaching the client about this drug? **Select all that apply.**

1. Dry mouth
2. Rhinorrhea

3. Constipation
4. Hyperglycemia
5. Stress incontinence

795. A nurse provides instruction when the beta blocker atenolol (Tenormin) is prescribed for a client with moderate hypertension. What action identified by the client indicates to the nurse that the client needs further teaching?

1. Move slowly when changing positions.
2. Take the medication before going to bed.
3. Expect to feel drowsy when taking this drug.
4. Count the pulse before taking the medication.

796. A client with type 2 diabetes develops gout, and allopurinol (Zyloprim) is prescribed. The client is also taking metformin (Glucophage) and an over-the-counter nonsteroidal antiinflammatory drug (NSAID). When teaching about the administration of allopurinol, what should the nurse instruct the client to do?

1. Decrease the daily dose of NSAIDs.
2. Limit fluid intake to one quart a day.
3. Take the medication on an empty stomach.
4. Monitor blood glucose levels more frequently.

797. A health care provider prescribes a vitamin tablet that contains vitamin B complex. What should the nurse teach the client?

1. It may turn the urine bright yellow.
2. The daily fluid intake should be increased.
3. The drug should be taken on an empty stomach.
4. It may accumulate in the body if an excessive amount is taken.

798. A nurse is administering 40 mg of furosemide (Lasix) intravenously. Which sensation reported by the client does the nurse consider when determining that it is being administered too quickly?

1. "Bladder feels full"
2. "Ears are plugged up"
3. "Heart is beating fast"
4. "Left arm feels numb"

799. Nesiritide (Natrekor), a vasodilator, is prescribed for a client with acute heart failure and pulmonary edema. The nurse is assessing the client's response to the medication. Which clinical manifestation should decrease when the medication is effective?

1. Dyspnea
2. Hypotension
3. Unstable angina
4. Premature heartbeats

800. A client with a history of tuberculosis reports difficulty hearing. Which medication should the nurse consider is related to this response?

1. Streptomycin
2. Pyrazinamide
3. Isoniazid (INH)

4. Ethambutol (Myambutol)

## Answers and Rationales

---

# Growth and Development

1. 4 Accidents are common during young adulthood because of immature judgment and impulsivity associated with this stage of development.
- 1 Kidney dysfunction is not a problem specific to any one stage of growth. 2 Cardiovascular disease is a common health problem in middle adulthood. 3 Glaucoma is a common health problem in the older adult.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, General Nursing Care of Young Adults
2. 3 Neurologic aging causes forgetfulness and a slower response time; repetition increases learning.  
1, 4 This principle is applicable to all learning regardless of the client's age. 2 Learning occurs, but it may take longer.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, General Nursing Care of Middle-Older and Old-Older Adults
3. 4 Osteoporosis is not restricted to women; it is a potential major health problem of all older adults; estimates indicate that half of all women have at least one osteoporotic fracture, and the risk in men is estimated between 13% and 25%; a bone mineral density (BMD) measurement assesses the mass of bone per unit volume or how tightly the bone is packed.  
1 Osteoporosis also can occur in men. 2 Exercise may decrease the occurrence of, but will not prevent, osteoporosis; a regimen including weight-bearing exercises is advised. 3 A small frame is a risk factor for osteoporosis.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, General Nursing Care of Middle-Older and Old-Older Adults
4. 1 Smoking is a major risk factor for cardiovascular disease and hypertension, major health problems of middle-age adults.  
2 Middle-age adults are not at greater risk for infection. 3 Alcohol intake should be limited, but total abstinence is not required for prevention of health problems. 4 HDL levels should be increased to help prevent cardiovascular disease.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, The Middle-Older and Old-Older Adult, Data Base
5. 2 Bones become more fragile because of loss of bone density associated with the aging process; this often is associated with lower circulating levels of estrogens or testosterone.  
1 Carelessness is a characteristic applicable to certain individuals rather than to people within a developmental level. 3 Although prolonged lack of weight-bearing activity is associated with bone demineralization, hip fractures also occur in active older adults. 4 Rheumatoid diseases can affect the skeletal system but do not increase the incidence of hip fractures.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 5, The Middle-Older and Old-Older Adults, Data Base

6. Answer: 3, 4.

1 There should be no interference with swallowing in older individuals. 2 Older individuals tend to feel the cold and rarely complain of the heat. 3 Changes in the ciliary muscles, decrease in pupil size, and a more rigid pupil sphincter contribute to an increased sensitivity to glare. 4 This may make an older individual unaware of a serious illness, thermal extremes, or excessive pressure. 5 There is a decreased response to stimuli in the older individual.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, The Middle-Older and Old-Older Adults, Data Base

7. Answer: 1, 3.

1 Cerumen (ear wax) becomes drier and harder as a person ages. 2 There is no greater incidence of tympanic tears caused by the aging process. 3 Generally, female voices have a higher pitch than male voices; older adults with presbycusis (hearing loss caused by the aging process) have more difficulty hearing higher-pitched sounds. 4 The hair in the auditory canal increases, not decreases. 5 The epithelium of the lining of the ear becomes thinner and drier.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 5, General Nursing Care of Middle-Older and Old-Older Adults

8. 3 Aged clients may display psychomotor retardation and need more time to complete the tasks associated with the activities of daily living; mealtimes should be relaxing and social.

1 Supplemental drinks should augment meals and be offered between meals, not as a substitute for meals. 2 Clients should be encouraged to feed themselves to remain as independent as possible; spoon feeding may not mirror the pace of eating preferred by the client, and forcing the client to eat all of the food may precipitate anxiety, frustration, and agitation. 4 Placement of a gastrostomy tube is premature.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 5, General Nursing Care of Middle-Older and Old-Older Adults

9. 2 With aging there is a decreased vasomotor response and diminished elasticity of blood vessels that do not respond quickly to changes from horizontal to vertical; orthostatic hypotension may occur. Changing positions slowly allows the body to adjust, which prevents dizziness and loss of balance.

1 Usual fluid intake patterns can be maintained. 3 Furosemide (Lasix) should be taken with meals to prevent gastric irritation. It is best to take it in the morning rather than at night so that sleep is not interrupted with the need to void. 4 There is no link between furosemide and skin breakdown.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 5](#), General Nursing Care of Middle-Older and Old-Older Adults

# Circulatory System (Cardiovascular, Blood, and Lymphatic Systems)

10. The heart's apex is between the fifth and sixth ribs at the midclavicular line. It is closest to the chest wall here, so auscultation is easier.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Review of Anatomy and Physiology, Heart

11. 4 The cardiac rhythm is monitored and rhythm disturbances documented; disturbances are stored, printed, and then analyzed in relation to the client's activity/symptom diary.

1 The monitor must remain in place constantly for accurate recordings. 2 The client must keep a record of activities and symptoms while the monitor records cardiac rhythm disturbances, and then an analysis of correlations between the two is made. 3 A chest radiograph, not a Holter monitor, will reveal the size and contour of the heart.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

12. 3 A day's activities should be recorded so that they can be compared with the occurrence of dysrhythmias.

1 It is not necessary to discontinue medications. 2 It is not necessary to avoid using a microwave oven. 4 Obtaining blood pressure readings while wearing a Holter monitor is not necessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

13. 4 Caffeine is a stimulant that causes vasoconstriction and is contraindicated for a client with a dysrhythmia.

1, 2 Although this is a true statement, it does not provide information as to why it is not

good for the heart. Adherence to a medical regimen increases when the client understands the rationale for recommendations. **3** Tea contains caffeine and should be avoided by a client with a dysrhythmia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Coronary Artery Disease (CAD), Nursing Care

14. **1** This test evaluates the heart's ability to meet the need for additional oxygen in response to the stress of exercising. Changes in the ECG identify dysrhythmias and ST changes indicative of myocardial ischemia.

**2** This test assists in the differential diagnosis of chest pain; the diagnosis of heart disease is made via the results of a variety of diagnostic procedures and laboratory tests. **3** This is a valuable test that will influence the diagnosis and treatment of heart disease. **4** This is a noninvasive test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

15. **2** Temperature may increase within the first 24 hours as a result of the inflammatory response to tissue destruction and persist as long as a week.

**1** Diaphoresis is caused by activation of the sympathetic, not parasympathetic, nervous system and may indicate cardiogenic shock. **3** Pain is persistent and constant, not intermittent; it is caused by oxygen deprivation and the release of lactic acid. **4** The blood pressure increases initially but then drops because there is a decrease in cardiac output.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Coronary Artery Disease, Data Base

16. **2** Pulse pressure is obtained by subtracting the diastolic from the systolic reading after the blood pressure has been recorded.

**1** This is the definition of cardiac output; it is not the pulse pressure. **3** This is not pulse pressure. **4** This is the pulse deficit.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Review of Anatomy and Physiology, Blood Vessels

17. **2** Temperatures of 102° F (38° C) or greater lead to an increased metabolism and cardiac workload.

**1** Although diaphoresis is related to an elevated temperature, it is not the reason for notifying the health care provider. **3** An elevated temperature is not an early sign of cerebral edema. Open heart surgery is not associated with cerebral edema. **4** Fever is unrelated to hemorrhage; in hemorrhage with shock, the temperature decreases.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Cardiac Surgery, Nursing Care

18. **2** Constriction of the peripheral blood vessels and the resulting increase in blood pressure impair circulation and limit the amount of oxygen being delivered to body cells,

particularly in the extremities.

**1** Nicotine constricts all peripheral vessels, not just superficial ones; its primary action is vasoconstriction; it will not dilate deep vessels. **3, 4** Nicotine constricts rather than dilates peripheral vessels.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Vascular Disease, Nursing Care

**19. 2** Disimpaction can cause vagal stimulation, which slows the heart. The vagus is the principal nerve of the parasympathetic portion of the autonomic nervous system, and its axon terminals release acetylcholine. The response of the viscera to acetylcholine varies, but in general the organ is in a relaxed state.

**1** This is an action of the sympathetic nervous system (accelerator nerve) caused by the release of norepinephrine. **3** Stimulation of the sympathetic nervous system dilates bronchioles in the lungs; the vagus nerve constricts them. **4** There are parasympathetic fibers to the coronary blood vessels; sympathetic impulses dilate these vessels.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Review of Anatomy and Physiology,

Regulatory Mechanisms Affecting Circulation

**20.** Answer: 1, 5.

**1** Stasis ulcers result from edema or minor injury to the limb; they frequently form over the medial malleolus (inner ankle). **2** Necrotic tissue is associated with peripheral arterial disease. **3** Ecchymosis is caused by bleeding. **4** Diminished pulses are associated with peripheral arterial disease. **5** The release of iron from hemoglobin as erythrocytes disintegrate in tissue results in ferrous sulfide formation, causing darkening of the tissues.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Vascular Disease, Data Base

**21. 4** Diminished sensation decreases awareness of injury. Injured tissue cannot heal properly because of cellular deprivation of oxygen and nutrients; ulceration and gangrene may result.

**1** Emotional stress does not cause tissue injury; however, because of vasoconstriction, it may prolong healing. **2** Inadequate hygiene is only one stress that may cause tissue trauma; protein is not related to this disease. **3** Although caffeine stimulates the peripheral vessels to constrict, limiting oxygen to cells, it is not the major cause of ulceration.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Vascular Disease, Data Base

**22. 2** The pulmonary capillary beds are the first small vessels that the embolus encounters once it is released from the calf veins.

**1, 4** This will not occur because the embolus will enter the pulmonary system first. **3** Dry gangrene occurs when the arterial rather than the venous circulation is compromised.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Nursing Care

23. 4 A drop in blood pressure; rapid pulse rate; cold, clammy skin; and oliguria are signs of decreased blood volume and shock, which if not treated promptly can lead to death.

1 This is an expected response; the client will push out the airway as the effects of anesthesia subside. 2, 3 This is a common response to depressant effects of anesthesia. **Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Shock, Data Base

24. 2 Localized sensory changes may indicate nerve damage, impaired circulation, or thrombophlebitis. Activity should be limited and the health care provider notified.

1 Symptoms may indicate a serious problem, and the health care provider must be notified. While fluids may be helpful to prevent hemoconcentration and the resulting risk of thrombus formation, fluids should be held in case a surgical procedure or diagnostic test is performed that requires the client to refrain from oral intake. 3 Rubbing or massaging the legs is contraindicated because of possible dislodging of a thrombus if present. 4 Bed rest is indicated to prevent the possibility of further damage or creation of an embolus.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Data Base

25. 4 A sympathectomy causes dilation of the blood vessels in the lower extremities; the resulting shift in the blood volume lowers the systemic blood pressure.

1 Fluid losses associated with surgery may gradually lower the blood pressure; this is compensated by endocrine and renal mechanisms. 2 Although anesthesia depresses vital signs, generally there is not a sudden drop in blood pressure postoperatively. 3 Epinephrine will increase the blood pressure by stimulating cardiac contractility.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Review of Anatomy and Physiology, Regulating Mechanisms Affecting Circulation

26. 2 The clinical findings indicate the presence of inflammation. The intravenous catheter should be removed to prevent the development of thrombophlebitis.

1, 3 This is unsafe. It may further irritate the vein and precipitate a thrombophlebitis. 4 Although this may relieve the discomfort, it is not an intervention that will resolve the problem.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Data Base

27. Answer: 1, 3, 6.

1 Pain is related to the edema associated with the inflammatory response. 2 Intermittent claudication (pain when walking, resulting from tissue ischemia) may occur with peripheral arterial disease. 3 Redness is related to vasodilation and the inflammatory response. 4 Although some localized edema occurs, pitting edema does not occur in thrombophlebitis. 5 Ecchymosis is a sign of bleeding; thrombophlebitis is caused by a

clot. **6** Thrombophlebitis is inflammation of a vein that occurs with the formation of a clot. Warmth is related to vasodilation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Vascular Disease, Data Base

28. **2** The clinical findings indicate a possible thrombophlebitis. Bed rest with the legs elevated should be maintained and the health care provider notified immediately. A thrombus may progress to a pulmonary embolus.

**1** The legs should be kept elevated until the client is evaluated by the health care provider. **3** The application of warm soaks is a dependent function of the nurse that requires a health care provider's order. **4** Administering an analgesic for pain in a site other than the one for which it was prescribed is not an independent nursing function; in addition, the medication may obscure the problem in the calf, place the client in jeopardy, or further delay treatment.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Nursing Care

29. The pulse most distal to the graft should be assessed first to determine adequacy of circulation. The pedal pulse is located on the top of the foot and is the most distal peripheral pulse (see illustration on following page).

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Vascular Disease, Nursing Care

30. **3** Support hose apply external pressure on the veins, preventing the retrograde

pressure or flow that may occur in the standing or sitting positions; application before arising prevents the veins from having the opportunity to become engorged.

**1** If this schedule is followed, at some point the feet will be dependent before the stockings are put on; venous pooling and edema may occur; application of elastic stockings at this time can cause tissue trauma. **2** They usually need not be worn while in bed with the feet elevated during sleep because gravity prevents venous pooling. **4** Stockings must be removed so that the legs can be washed and dried at least daily.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Nursing Care

**31. 4** An elastic bandage can be adjusted to the varying proportions of the client's legs.

**1** This action requires a health care provider's order. **2** This is unsafe; this permits venous stasis. **3** This will increase the pressure in the popliteal space, which increases venous stasis and the risk of thrombophlebitis.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Vascular Disease, Nursing Care

**32. 4** Sitting on the edge of the bed before standing up gives the body a chance to adjust to the effects of gravity on circulation in the upright position.

**1** Support hose may help prevent orthostatic hypotension by increasing venous return. However, they must be applied before getting out of bed and should not be worn continuously. **2** This will not prevent episodes of orthostatic hypotension. **3** Energetic tasks, once standing and acclimated, do not increase hypotension.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Hypertension, Nursing Care

**33. 1** ACE (angiotensin-converting enzyme) increases the sensitivity of the cough reflex, leading to the common adverse effect sometimes referred to as an ACE cough.

**2, 3, 4** A cough is not a side effect of this category of medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Antihypertensives

**34. 4** Vasodilation will lower the blood pressure.

**1** The pulse rate is not decreased and may increase. **2** Breath sounds are not directly affected by vasodilation, although vasodilator medications can decrease preload and afterload, which could indirectly affect breath sounds in heart failure. **3** The urine output is not affected immediately, although control of blood pressure can help preserve renal function over time.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Antihypertensives

**35. 4** Angiotensin II receptor blockers (ARBs) lower the blood pressure; they block the receptor sites in smooth muscles and adrenal glands so vasoconstriction is prevented.

1, 2, 3 ARBs do not directly affect this.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Antihypertensives

36. 4 Cholesterol is a sterol found in tissue; it is attributed in part to diets high in saturated fats.

1 Only animal foods furnish dietary cholesterol. 2 Exercise, not cholesterol, increases HDL levels and helps decrease the risk of heart disease. 3 Cholesterol is also produced by the body and is needed for the synthesis of bile salts, adrenocortical and steroid sex hormones, and provitamin D.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Coronary Artery Disease, Nursing Care

37. 1 Fiber and fluids help prevent the most common adverse effect of constipation and its complication—fecal impaction.

2 The medication should be taken with meals. 3 The pulse is not affected. 4 Cholestyramine binds bile in the intestine; therefore, it reduces the incidence of jaundice.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Antilipidemics

38. 1 Although oatmeal is a soluble fiber, whole milk is high in saturated fat and should be avoided.

2 Olive oil contains unsaturated fat. 3 Most fish have a low fat content; fruit does not contain fat. 4 Soluble fiber helps to lower cholesterol; skim milk does not contain fat.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Coronary Artery Disease, Nursing Care

39. Answer: 2, 3, 4, 6.

1 This is an unsaturated fat, which is a healthy choice. 2 This is high in sodium and should be avoided to prevent fluid retention and an elevated blood pressure. 3 This is high in saturated fats and contributes to hyperlipidemia; skim milk is the healthier choice. 4 These are high in saturated fats and should be avoided. 5 Vegetables and whole grains are low in fat and have soluble fiber, which may reduce the risk for heart disease. 6 These are high in cholesterol and should be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Coronary Artery Disease, Nursing Care

40. Answer: 2, 3, 5.

1 Simvastatin (Zocor) does not affect levels of potassium. 2 Simvastatin increases photosensitivity; the client should avoid sun exposure and use sunblock. 3 The client should be monitored for the adverse effects of glaucoma and cataracts. 4 The medication is most effective when taken at bedtime because cholesterol synthesis is

highest at night. **5** Gray-bronze skin and unexplained muscle pain are signs of rhabdomyolysis. Rhabdomyolysis, a life-threatening response, is the disintegration of muscle associated with myoglobin in the urine.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antilipidemics

41. **2** Hypertension is 78% more prevalent in African Americans than among Caucasian Americans; 30% of African Americans have hypertension.

**1** African Americans have approximately 50% less risk for osteoporosis than Caucasian Americans. **3** Caucasian-American women are 30% more likely to be diagnosed with uterine cancer than African-American women. **4** Statistics indicate that African Americans are less likely to develop thyroid disorders than Caucasian Americans.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Hypertension, Data Base

42. **4** Dyspnea may indicate development of pulmonary edema, which is a life-threatening condition.

**1** This CNS side effect may occur in some people, but it is not life-threatening. **2, 3** This is a common side effect of this medication, which is not life-threatening.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

43. **Answer: 3 tablets.** Use the “Desire over Have” formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire } 150 \text{ mg}}{\text{Have } 50 \text{ mg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$50 x = 150$$

$$x = 3 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

44. **2** Ischemia causes tissue injury and the release of chemicals, such as bradykinin, that stimulate sensory nerves and produce pain.

**1** Arterial spasm, resulting in tissue hypoxia and pain, is associated with angina

pectoris. **3** Arteries, not veins, are involved in the pathology of a myocardial infarction. **4** Tissue injury and pain occur in the myocardium.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 6, Coronary Artery Disease, Data Base

45. **3** Anginal pain, which can be anticipated during certain activities, may be prevented by dilating the coronary arteries immediately before engaging in the activity.

**1** One tablet is generally administered at a time; doubling the dosage may produce severe hypotension and headache. **2** The sublingual form of nitroglycerin is absorbed directly through the mucous membranes and should not be swallowed. **4** When the pain is relieved, rest will generally prevent its recurrence by reducing oxygen consumption of the myocardium.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Coronary Vasodilators

46. **3** The pulse should be assessed because the trauma at the insertion site may interfere with blood flow distal to the site. There is also danger of bleeding.

**1** Rest is not a priority, although the extremity in which the catheter was inserted usually is immobilized for a period of time to prevent bleeding at the insertion site. **2** This is determined on an individual basis; it is not routine. **4** The client will be on a cardiac monitor, which will allow for continuous monitoring.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Cardiac Catheterization

47. **1** Myocardial infarction (MI) may cause increased irritability of tissue or interruption of normal transmission of impulses. Dysrhythmias occur in about 90% of clients after an MI.

**2** Hypokalemia may result when clients are taking cardiac glycosides and diuretics; this is a complication associated with therapy, not a pathologic entity related to the MI itself. **3** Anaphylactic shock is caused by an allergic reaction, not by an MI. **4** Cardiac enlargement is a slow process, so it will not be evident in the coronary care unit.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Coronary Artery Disease, Data Base

48. **4** The catheter is placed in the pulmonary artery. Information regarding left ventricular function is obtained when the catheter balloon is inflated.

**1** Information on stroke volume, the amount of blood ejected by the left ventricle with each contraction, is not provided by a pulmonary catheter. **2** Although a central venous pressure reading can be obtained with the pulmonary catheter, it is not as specific as a pulmonary wedge pressure, which reflects pressure in the left side of the heart. **3** The patency of the coronary arteries usually is evaluated by cardiac catheterization.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 6, Related Procedures, Hemodynamic Monitoring With Pulmonary Artery Catheter

49. **Answer: 20 mL/hr.** Use "Desire over Have" formula of ratio and proportion to solve

the problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{1000 \text{ units}}{25,000 \text{ units}} = \frac{x \text{ mL}}{500 \text{ mL}}$$

$$25,000 x = 1000 \times 500$$

$$25,000 x = 500,000$$

$$x = 500,000 \div 25,000$$

$$x = 20 \text{ mL/hr}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

50. 2 Desired anticoagulant effect is achieved when the activated partial thromboplastin time is 1.5 to 2 times normal.

1 While anticoagulants help prevent thrombi that could block cerebral circulation, they do not increase cerebral perfusion, and so will not affect existing confusion. 3 Although absence of bleeding suggests that the drug has not reached toxic levels, it does not indicate its effectiveness. 4 This medication does not affect the viscosity of blood.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

51. 2 The high vascularity of the nose, combined with its susceptibility to trauma (e.g., sneezing, nose blowing), makes it a frequent site of hemorrhage.

1, 3, 4 This response usually is not associated with anticoagulant therapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

52. 1 Warfarin (Coumadin) initially is prescribed day by day, based on international normalized ratio (INR) blood test results. This test provides a standard system to

interpret prothrombin times.

**2** APTT (accelerated partial thromboplastin time) is used to evaluate the effects of heparin, which acts on the intrinsic pathway. **3** Bleeding time is the time required for blood to cease flowing from a small wound; it is not used for warfarin dosage calculation. **4** Sedimentation rate is a test used to determine the presence of inflammation or infection; it does not indicate clotting ability.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

53. **4** The client is up more at home, so dependent edema usually increases.

**1** These should not be expected and are, in fact, signs of postpericardiotomy syndrome. **2** Serosanguineous drainage may persist after discharge. **3** These symptoms will persist longer.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Cardiac Surgery, Nursing Care

54. Answer: 1, 3, 4.

**1** Digoxin increases kidney perfusion, which results in urine formation and diuresis. **2** Digoxin increases the force of contractions (inotropic effect) and decreases the heart rate (chronotropic effect). **3** Because of digoxin's inotropic and chronotropic effects, the heart rate will decrease. **4** The urine output increases because of improved cardiac output and kidney perfusion, resulting in a reduction in edema. **5** Digoxin does not affect a heart murmur. **6** This is a specific sign of right ventricular heart failure; it is treated with diuretics to reduce the intravascular volume and venous pressure.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Cardiac Glycosides

55. **1** Diuretic therapy that affects the loop of Henle generally involves the use of drugs (e.g., bumetanide [Bumex]) that directly or indirectly increase urinary sodium, chloride, and potassium excretion.

**2** Sodium restriction does not necessarily accompany administration of bumetanide. **3** Dyspnea does not directly result in a depletion of electrolytes. **4** Unless otherwise ordered, oral intake is unaffected.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Diuretics

56. **2** Shock may have different etiologies (e.g., hypovolemic, cardiogenic, septic, anaphylactic) but always involves a drop in blood pressure and failure of the peripheral circulation because of sympathetic nervous system involvement. In cardiogenic shock, the failure of peripheral circulation is caused by the ineffective pumping action of the heart.

**1** Shock can be reversed by the administration of fluids, plasma expanders, and vasoconstrictors. **3** It may be a reaction to tissue injury, but there are many different etiologies (e.g., hypovolemia, sepsis, anaphylaxis); it is not fleeting. **4** Hypovolemia is

only one cause. Shock may also be septic, cardiogenic, or anaphylactic; it always involves a drop in blood pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 6, Shock, Data Base

57. **1** With complete atrioventricular block, the ventricles take over the pacemaker function in the heart but at a much slower rate than that of the SA node. As a result there is decreased cerebral circulation, causing syncope.

**2** Headache is not related to heart block. **3** The heart rate usually is slow because the ventricular rhythm is not initiated by the SA node. **4** This is not related to heart block unless decreased cerebral perfusion causes a brain attack.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

58. **3** Ventricular fibrillation will cause irreversible brain damage and then death within minutes because the heart is not pumping blood to the brain. Defibrillation or CPR until defibrillation is possible must be initiated immediately.

**1, 2, 4** Although this condition requires prompt treatment, death is not as imminent as with ventricular fibrillation.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

59. **4** Atropine blocks vagal stimulation of the SA node, resulting in an increased heart rate.

**1** Digoxin (Lanoxin) slows the heart rate; hence it would not be indicated in this situation. **2** Lidocaine (Xylocaine) decreases myocardial sensitivity and will not increase the heart rate. **3** Amiodarone (Cordarone) is an antidysrhythmic drug used for ventricular tachycardia; it will not stimulate the heart rate.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Cardiac Stimulants

60. **4** Bundle branch block interferes with the conduction of impulses from the AV node to the ventricle supplied by the affected bundle. Conduction through the ventricles is delayed, as evidenced by a widened QRS complex.

**1, 3** Changes in the T waves and/or ST segments usually occur as a result of cardiac damage. **2** P waves, produced when the SA node fires to begin a cycle, are present in bundle branch block.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Coronary Artery Disease, Data Base

61. **2** Pacemaker impulses are represented by a spike, which should be followed by a QRS complex.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Implantable Cardiac Devices

62. **3** Ventricular fibrillation reflects a rapid feeble twitching of the ventricles; it has an irregular sawtooth configuration with unidentifiable PR intervals and QRS complexes.

**1** Atrial flutter is characterized by an atrial rate of 250 to 350 beats/min and a ventricular rate of 60 to 150 beats/min; flutter to ventricular responses usually are 2 : 1, 3 : 1, or 4 : 1. **2** Atrial fibrillation is characterized by an atrial rate of 350 to 600 beats/min and a ventricular rate of 120 to 200 beats/min; the rhythm is grossly irregular. **4** Ventricular tachycardia has a rate of 140 to 200 beats/min; the rhythm is usually regular but may vary; P waves are unidentifiable; PR intervals are unmeasurable; QRS complexes are wide and bizarre.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

63. **3** Cardioversion involves administration of precordial shock, which is synchronized with the R wave to interrupt the heart rate. It is used for atrial fibrillation, supraventricular tachycardia, and ventricular tachycardia with a pulse when pharmaceutical preparations fail. The heart is stopped by the electric stimulation, and it is hoped that the SA node will take over as pacemaker.

**1, 2** Because there are no R waves, cardioversion should not be done. **4** Premature ventricular complexes suggest an irritable myocardium and generally respond well to antidysrhythmic agents.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Cardioversion

64. **3** A permanent fixed (asynchronous) pacemaker is set at a predetermined rate; if a pulse rate is more or less than the preset rate, the pacemaker may be malfunctioning.

**1** The client need not alter previous sleeping habits. **2** Regular activity may be resumed when healing has occurred. **4** This is the purpose of a pacemaker that provides on-demand pacing.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Implantable Cardiac Devices

65. **3** On-demand pacing initiates impulses when the client's pulse rate begins to fall below the preset rate. A rate below this indicates malfunction of the pacemaker.

**1** The client's heart rate may still be irregular. **2** The pacemaker affects the rate, not the

volume of the pulse. **4** The client's heart rate may exceed the pacemaker.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Cardiac Pacemaker Insertion

66. **4** With ventricular tachycardia there are 100 to 250 beats/min with a regular or irregular rhythm, P waves usually are not present, PR intervals are not measurable, and QRS complexes are wide and distorted.

**1** With atrial flutter there are 250 to 350 atrial beats/min with a regular rhythm, more than 100 ventricular beats/min with an irregular rhythm, P waves are sawtoothed, PR intervals are variable, and QRS complexes usually are normal. **2** With atrial fibrillation there are 350 to 600 atrial beats/min with an irregular rhythm, more than 100 ventricular beats/min with an irregular rhythm, P waves are chaotic, PR intervals are not measurable, and QRS complexes usually are normal. **3** With ventricular fibrillation the rate is not measurable, the rhythm is irregular, P waves are absent, PR intervals are not measurable, and QRS complexes are not measurable.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

67. **2** Ventricular fibrillation is a lethal dysrhythmia and, once identified, must be terminated immediately by precordial shock (defibrillation) so the sinus node can again act as the heart's pacemaker. This usually is a standing order in a coronary care unit.

**1** Oxygen is administered to correct hypoxia; it does not take priority over defibrillation. **3** CPR is instituted only when defibrillation fails to terminate the dysrhythmia. **4** Bicarbonate is administered to correct acidosis; it does not take priority over defibrillation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

68. **3** Amiodarone (Cordarone) decreases the irritability of the ventricles by prolonging the duration of the action potential and refractory period. It is used in the treatment of ventricular dysrhythmias.

**1** Digoxin (Lanoxin) slows and strengthens ventricular contractions; it will not rapidly correct ectopic beats. **2** Furosemide (Lasix), a diuretic, does not affect ectopic foci. **4** Norepinephrine (Levophed) is a sympathomimetic and is not the drug of choice for ventricular irritability.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

69. **2** The precordial shock during cardioversion must not be delivered on the T wave, or ventricular fibrillation may ensue. By placing the synchronizer in the "on" position, the machine is preset so that it will not deliver the shock on the T wave.

**1** The energy level may be set from 50 to 100 W/sec. **3, 4** This will not ensure that the shock is not delivered on the T wave.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures,

## Cardioversion

70. **1** Digoxin (Lanoxin) is used to treat atrial fibrillation, which is depicted in the strip. **2** This is a normal sinus rhythm; digoxin is not indicated. **3** This is ventricular tachycardia; digoxin is not indicated. **4** This is sinus bradycardia; digoxin is contraindicated.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

71. **2** Irreversible brain damage will occur if a client is anoxic for more than 4 minutes.

**1** The age of the client does not affect the response by the arrest team. **3** The earlier heart rate is of minimal importance; the rhythm is more significant. **4** Although a variety of emergency medications must be available, their administration is prescribed by the health care provider.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

72. **1** Additional help and a cardiac defibrillator must be obtained immediately.

**2** The carotid, not radial, pulse is used. **3** This is done after the nurse summons help. **4** Two lung inflations are given after 30 chest compression.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Basic Life Support (Cardiopulmonary Resuscitation) by Health Care Provider

73. **4** The sternum must be depressed at least 2 inches to compress the heart adequately between the sternum and vertebrae and to simulate cardiac pumping action.

**1, 2, 3** This distance is ineffectual for an adult.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Basic Life Support (Cardiopulmonary Resuscitation) by Health Care Providers

74. **3** This provides the best leverage for depressing the sternum. Thus, the heart is adequately compressed, and blood is forced into the arteries. Grasping the fingers keeps them off the chest and concentrates the energy expended in the heel of the hand while minimizing the possibility of fracturing ribs.

**1** Pressure spread over two hands may inadequately compress the heart and fracture the ribs. **2** Application of pressure by the fingers is less effective; this provides inadequate cardiac compression. **4** Both hands must be utilized; pressure on the lower portion of the sternum may fracture the xiphoid process, which can injure vital underlying organs.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Basic Life Support

75. **3** Right ventricular heart failure causes increased pressure in the systemic venous system, which leads to a fluid shift into the interstitial spaces. Because of gravity, the lower extremities are first affected in an ambulatory client.

**1** Pulmonary edema results in severe respiratory distress and peripheral edema. **2** Myocardial infarction itself does not cause peripheral edema. **4** Pulmonary disease will not result in varying degrees of edema.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Heart Failure, Data Base

76. **2** Elevation of extremities promotes venous and lymphatic drainage by gravity.

**1, 3** This is a dependent function of the nurse. **4** This procedure may have little effect on edema.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Heart Failure, Nursing Care

77. Answer: 1, 4.

**1** Heart failure is the failure of the heart to pump adequately to meet the needs of the body, resulting in a backward buildup of pressure in the venous system. Clinical manifestations include edema, ascites, hepatomegaly, tachycardia, dyspnea, and fatigue. **2** Vertigo generally is not related to right ventricular failure. **3** Because a diminished cardiac output decreases blood flow to the kidneys, there will be a decreased, not increased, urine output. **4** Dyspnea occurs because of pulmonary congestion and inadequate delivery of oxygen to all body cells. **5** Palpitations may indicate coronary insufficiency or infarction.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Heart Failure, Data Base

78. **1** In right ventricular heart failure, blood backs up in the systemic capillary beds; the increase in plasma hydrostatic pressure shifts fluid from the intravascular compartment to the interstitial spaces, causing edema.

**2** This occurs with crushing injuries or if proteins pathologically shift from the intravascular compartment to the interstitial spaces. **3** Increased fluid pressure in the intravascular compartment causes fluid to shift to the tissues; the tissue hydrostatic pressure does not decrease. **4** Although a decrease in colloid osmotic (oncotic) pressure can cause edema, it results from lack of protein intake, not increased hydrostatic pressure associated with right ventricular heart failure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Heart Failure, Data Base

79. **3** Failure of the right ventricle causes an increase in pressure in the systemic circulation. To equalize this pressure, fluid moves into the tissues, causing edema, and into the abdominal cavity, causing ascites; ascites leads to an increased abdominal girth.

**1** There is no loss of the cellular constituents in blood with right ventricular heart failure. **2** Ascites is the accumulation of fluid in an extracellular space, not intracellular. **4** The opposite results when there is a pressure increase in the systemic circulation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Heart Failure, Data Base

80. Answer: 1, 3.

**1** Spironolactone (Aldactone) is potassium-sparing, and therefore beverages and foods containing potassium such as potatoes, bananas, avocados, oranges, dates, apricots, and raisins should be avoided to prevent hyperkalemia. **2** Red meat may need to be limited for other reasons not related to spironolactone. **3** Spironolactone is potassium-

sparing, and therefore beverages and foods containing potassium such as cantaloupe should be avoided to prevent hyperkalemia. **4** Whole grains are associated with prevention of constipation and should not be avoided. **5** Dairy products are rich in sodium and calcium; spironolactone may cause hyponatremia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Diuretics

81. **3** Streptococcal infection can be spread through the circulation to the heart; endocarditis results and affects the valves of the heart.

**1, 2, 4** This is not caused by beta-hemolytic streptococcus.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 6, Inflammatory Diseases of the Heart, Data Base

82. **1** Irritability and restlessness associated with anxiety increase the metabolic rate, heart rate, and blood pressure; these complicate heart failure.

**2** Anxiety does not directly interfere with respirations; an increase in cardiac workload will increase respirations. **3** Anxiety alone usually does not elevate the body temperature. **4** Anxiety can cause an increase in the amount of oxygen used and leads to an increased respiratory rate.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 6, Coronary Heart Disease Heart Failure, Nursing Care

83. **4** The orthopneic position allows maximum lung expansion because gravity reduces the pressure of the abdominal viscera on the diaphragm and lungs.

**1** Excessive coughing and mucus production is characteristic of pulmonary edema and does not need to be encouraged. **2** Elevation of the extremities should be avoided because it increases venous return, placing an increased workload on the heart. **3** Positioning for postural drainage does not relieve acute dyspnea; furthermore, it increases venous return to the heart.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Heart Failure, Data Base

84. **2** Not adhering to the treatment regimen may interfere with effective resolution of the MI, and further intervention is necessary.

**1, 3, 4** This statement is an appropriate response related to teaching concerning self-care after an MI.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 6, Coronary Artery Disease, Nursing Care

85. **2** These symptoms are associated with compromised arterial perfusion. A thrombus is a complication of a femoral arterial cardiac catheterization and must be suspected in the absence of a pedal pulse in the extremity below the entry site.

**1** A circulatory assessment should be conducted first; the health care provider may or may not need to be notified immediately concerning the results of the

assessment. **3** This is unnecessary; the symptoms indicate a local peripheral problem, not a systemic or cardiac problem. **4** These symptoms are not expected.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Cardiac Catheterization

86. **4** Because the femoral artery is large, it has the potential for hematoma formation and hemorrhage after surgery.

**1** The client should not be in pain after this procedure. **2** Although the leg used for circulatory access must be kept extended and immobile for several hours, this is not the priority.

**3** The ability to swallow is not affected because conscious sedation, not general anesthesia, is used

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Cardiac Catheterization

87. **4** Troponin T (cTnT) has an extraordinarily high specificity for myocardial cell injury. Cardiac troponins elevate sooner and remain elevated longer than many of the other enzymes that reflect myocardial injury.

**1** ALT (alanine aminotransferase) is found predominantly in the liver; it is found in lesser quantities in the kidneys, heart, and skeletal muscles; it is used primarily to diagnose and monitor liver, not heart, disease. **2** AST (serum aspartate aminotransferase), also known as SGOT (serum glutamic-oxaloacetic transaminase), is elevated 8 hours after a myocardial infarction. **3** Total LDH (lactate dehydrogenase) levels elevate 24 to 48 hours after a myocardial infarction.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Coronary Artery Disease, Data Base

88. **2** With heart failure the left ventricle is not functioning effectively, which is evidenced by an increased heart rate and crackles associated with pulmonary edema.

**1** This is done after vital signs and breath sounds are obtained and the client is stabilized. **3** Although an infection would complicate heart failure, there are no signs that indicate this client has an infection. **4** This is inappropriate for immediate monitoring; it should be done after vital signs and clinical assessments have been completed.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Heart Failure, Nursing Care

89. **4** Trauma to the artery can interfere with circulation to the accessed extremity. This is most easily assessed by checking the pulses bilaterally.

**1** The client is prescribed bed rest after the procedure, so gait is not assessed. **2** The gag reflex is not affected by the test. **3** The blood pressure should not be taken in the affected arm; the increase in pressure may initiate bleeding.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Angiography

90. **2** Diabetes is twice as high a predictor of coronary heart disease in women than in men. Diabetes cancels the cardiac protection that estrogen provides premenopausal women.

**1** This risk factor is common to both women and men. **3** An elevated C-reactive protein level, a marker of the inflammatory process, is heart-specific in predicting the likelihood of future coronary events in both women and men. **4** Low, not high, levels of HDL-C, a lipid factor, (less than 35 mg/dL) have a greater bearing on predicting CHD in women than in men.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Coronary Artery Disease, Data Base

91. Answer: 1, 2.

**1** Obesity increases cardiac workload associated with vascular changes that lead to ischemia, which causes an MI. **2** Hypertension damages blood vessels and increases peripheral resistance and cardiac workload, which may lead to an MI. **3** Increased levels of LDL, not HDL, increase the risk for heart disease. **4** Diabetes mellitus, not insipidus, is a risk factor for an MI. **5** The risk is higher for African Americans.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Coronary Artery Diseases, Data Base

92. **1** Although the balloon must be inflated to measure the capillary wedge pressure, leaving the balloon inflated will interfere with blood flow to the lung.

**2** Bearing down will increase intrathoracic pressure and alter the reading. **3** Although a supine position is preferred, it is not essential. **4** Agency protocols relative to flushing of unused ports must be followed.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures,

Hemodynamic Monitoring with Pulmonary Artery Catheter

93. Answer: 1, 2.

**1** The consistency of the RR intervals indicates a regular rhythm. **2** A normal P wave before each complex indicates the impulse originated in the SA node. **3** Elevation of the ST segment is a sign of cardiac ischemia and is unrelated to the rhythm. **4** The number of complexes in a 6-second strip is multiplied by 10 to approximate the heart rate; normal sinus rhythm is 60 to 100 beats/min. Fewer than six complexes per 6 seconds equals a heart rate less than 60 beats/min. **5** The QRS duration should be less than 0.12 seconds; the PR interval should be 0.12 to 0.2 second.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Related Procedures, Cardiac Monitoring

94. **4** Checking color and temperature, part of the neurovascular assessment, provides data about current perfusion of the extremity.

**1** While pain assessment is essential, incisional pain does not provide data about the neurovascular status of the extremity. **2** While the presence and quality of the pedal pulse provide data about peripheral circulation, it is not necessary to count the rate. **3** Clients with peripheral arterial disease experience loss of extremity hair, which will not change suddenly because of surgery.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 6, Vascular Disease, Nursing Care

95. Answer: 1, 3, 5.

**1** Blood in the pericardial sac compresses the heart so the ventricles cannot fill; this leads to a rapid, thready pulse. **2** Tamponade causes hypotension and a narrowed pulse pressure. **3** As the tamponade increases, pressure on the heart interferes with the ejection of blood from the left ventricle, resulting in an increased pressure in the right side of the heart and the systemic circulation. **4** As the heart becomes more inefficient, there is a decrease in kidney perfusion and therefore a decrease in urine output. **5** The increased venous pressure associated with cardiac tamponade causes jugular vein distention.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Cardiac Surgery, Nursing Care

96. **3** Iron is needed in the formation of hemoglobin.

**1** The client's anemia is caused by GI bleeding, not impaired RBC production. **2** Dextran is a plasma volume expander; it does not affect erythrocyte production. **4** Vitamin B<sub>12</sub> is a water-soluble vitamin that must be used as a supplement when an individual has pernicious anemia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Anemias and Blood Disorders, Data Base

97. **3** In hypovolemic shock, tachycardia is a compensatory mechanism in an attempt to increase blood flow to body organs.

**1** Urine output would fall to less than 30 mL/hr because a decreased blood volume causes a decreased glomerular filtration rate. **2** The blood pressure is decreased because of the decreased blood volume. **4** This respiratory rate is within the accepted range of 12 to 20 breaths/min; the respiratory rate is rapid with hypovolemic shock.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Shock, Data Base

98. **1** Baseline vital signs should be obtained immediately before administering the blood product for future comparison purposes. Two licensed nurses should confirm the verifying data between the client and the blood product. The nurse should remain with and monitor the client's vital signs during the first 15 minutes of administration of the blood product and then follow the institution's protocol to monitor for a transfusion reaction or fluid overload.

**2** Vital signs must be taken immediately before the blood product infusion is begun for accurate future comparisons. **3** It is not necessary for the licensed nurse verifying the data between the client and the blood product to be a supervisor. **4** Blood should not be hung without following the appropriate protocol for ensuring accuracy of the blood product for the client; the nurse should remain with and monitor the client's vital signs during the first 15 minutes of administration of the blood product to monitor for a transfusion reaction or fluid overload.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Related Procedures, Blood Transfusion

99. 4 A slow rate provides time to recognize a transfusion reaction that is developing before too much blood has been administered.

1 Dextrose solution will cause lysis of the RBCs; saline must be used. 2 Warming the blood to body temperature may cause clotting and hemolysis. 3 Blood samples may be drawn after, not before, a transfusion, but this is not routinely done.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Blood Transfusion

100. 2 Chills, headache, nausea, and vomiting are all signs of a transfusion reaction.

1 The infusion must be stopped before treatment of symptoms begins. 3 Slowing the infusion will continue the reaction, which may lead to kidney damage. 4 The health care provider should be notified after the transfusion is stopped.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Blood Transfusion

101. **Answer: 1000 mL.** Each bag of packed RBCs contains 250 mL for a total of 500 mL of packed RBCs. The total amount of sodium chloride received is 500 mL.  $500 + 500 = 1000$  mL of solution.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 6, Related Procedures, Blood Transfusion

102. 2 Massive amounts of clots formed in the microcirculation deplete platelets and clotting factors, leading to bleeding; the trauma of an injection may cause excessive bleeding.

1 This is associated with thrombophlebitis. 3 This could be traumatic and precipitate bleeding. 4 This is done to prevent thrombophlebitis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 6, Disseminated Intravascular Coagulation, Nursing Care

103. **Answer:** 1, 4.

1 Raisins are high in iron. 2 Although squash contains some iron, it is not the best source.

3 Although carrots contain some iron, they are not the best source. 4 Spinach is high in iron. 5 Although apricots contain some iron, they are not the best source.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

104. 3 Viscosity, a measure of a fluid's internal resistance to flow, is increased as the number of red cells suspended in plasma increases.

1 The number of cells does not affect the blood pH. 2 The hematocrit will be higher. 4 RBCs do not affect immunity.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 6, Review of Anatomy and Physiology, Blood

105. Answer: 4, 3, 5, 1, 2.

4 A client must sign a consent for the transfusion before the procedure; clients have the right to refuse. 3 Vital signs should be obtained immediately before the transfusion to serve as a baseline for comparison if a reaction is suspected. 5 Two nurses must verify that the numbers, ABO type, and Rh type on the blood label and laboratory record match before hanging the transfusion to minimize risk of transfusion reactions. 1 Clean gloves must be worn before inserting the spike of the blood administration set. 2 The transfusion is run slowly for the first 15 to 20 minutes, but only after other steps have been completed.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Blood Transfusion

106. 2 Antibodies produced against group A beta-hemolytic streptococci sometimes interact with antigens in the heart's valves, causing damage and symptoms of rheumatic heart disease; early recognition and treatment of streptococcal infections have limited the occurrence of rheumatic heart disease.

1 Hepatitis A, an inflammation of the liver, is caused by the hepatitis A virus (HAV), not by bacteria. 3 The most common causes of meningitis, an infection of the membranes surrounding the brain and spinal cord, include *Streptococcus pneumoniae*, *Neisseria meningitidis*, and *Haemophilus influenzae*. 4 This is thought to be an autoimmune disorder; it is not caused by microorganisms.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Review of Microorganisms

107. 2 Although blood is screened for the antibodies, there is a period between the time a potential donor is infected and the time when antibodies are detectable; there is still a risk, but it is minimal.

1 There is no current method of destroying the virus in a blood transfusion. 3 The screening tests involve identification of the antibody, not the virus itself; the virus can be identified by the polymerase chain reaction test but is not part of routine screening. 4 Although many people consider autotransfusion for elective procedures, a trauma victim does not have this option.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Blood Transfusion

108. 3 Brief pressure generally is enough to prevent bleeding.

1 No special positioning is required. 2 The site is cleansed before aspiration. 4 Frequent monitoring is unnecessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Procedures, Bone Marrow Aspiration

109. 1 Painless enlargement of the cervical lymph nodes often is the first sign of Hodgkin

disease, a malignant lymphoma of unknown etiology.

**2** Axillary node enlargement occurs after cervical lymph node enlargement. **3** Inguinal node enlargement occurs later. **4** Mediastinal node involvement follows after the disease progresses.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Lymphoma, Data Base

110. **2** The incidence increases with age; the median age when diagnosed is 67 years old.

**1, 3, 4** Younger individuals have a lower incidence of non-Hodgkin lymphomas.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Lymphoma, Data Base

111. **2** Radiation exposure may lead to depression of the bone marrow, with subsequent insufficient WBCs to combat infection.

**1** There is no increase in the number of cells; therefore, viscosity is not increased. **3** RBC production is decreased by radiation. **4** Pathologic fractures may occur in response to the disease, not treatment.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Lymphoma, Data Base

112. **3** Activated partial thromboplastin time should be 1.5 to 2.5 the control for heparin therapy.

**1, 2** INR and PT are used to evaluate therapeutic levels of warfarin (Coumadin). **4** The ACT increases to a range of 150 to 200 when heparin reaches therapeutic levels.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

113. **4** Clients with venous insufficiency often have edema, which may make palpation of an arterial pulse difficult. A Doppler uses sound waves so that the pulse can be heard.

**1** The quality of the pedal pulse, not the rate, is assessed to determine the adequacy of peripheral arterial circulation; the most distal site is preferred. **2** The nurse must make other assessments of circulation before notifying the health care provider. **3** Lowering the legs will increase edema and make palpation of pulses more difficult.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Vascular Disease: Nursing Care

114. Answer: 1, 4.

**1** The absence of hair on the toes occurs because of diminished circulation. **2** A superficial ulcer with irregular edges is associated with venous insufficiency; the ulcer associated with arterial insufficiency is deep, well demarcated, and may be gangrenous. **3** Pitting edema of the lower extremities is associated with venous insufficiency. **4** Reports of pain associated with exercising (intermittent claudication) are common because the increased need for oxygen leads to ischemia when arterial flow is impaired. **5** Increased pigmentation of the medial and lateral malleolus areas is associated with venous insufficiency and occurs as a result of degeneration of RBCs that leak into surrounding tissue.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Vascular Disease: Data Base

115. **3** Protamine sulfate is the antidote for heparin overdose and naloxone (Narcan) will reverse the effects of opioids such as morphine.

**1** Aspirin and warfarin (Coumadin) both interfere with coagulation. **2** While amoxicillin is used to treat some infections, an infection is not a medication, so amoxicillin (Amoxil) cannot be considered an antidote. **4** Both enoxaparin (Lovenox) and dalteparin (Fragmin) are low molecular weight heparins.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

116. **4** Vitamin K promotes the liver's synthesis of prothrombin, an important blood clotting factor, and will reverse the effects of warfarin (Coumadin).

**1, 3** This is not promoted by vitamin K. **2** Vitamin K does not affect calcium ionization.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 6, Review of Anatomy and Physiology, Blood

117. **2** Polycythemia vera results in pathologically high concentrations of erythrocytes in the blood; increased viscosity promotes thrombus formation.

**1** Hypertension usually is related to narrowing or sclerosing of arteries, not to an increased number of blood cells. **3** The fragility of blood cells does not affect the viscosity of the blood. **4** Erythrocyte immaturity is not related to increased viscosity.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 6, Anemias and Blood Disorders, Data Base

118. **1** An elevated plasma bilirubin level could indicate an increased rate of RBC destruction (bilirubin is a product of free hemoglobin metabolism); the individual may have a hemolytic anemia (e.g., thalassemia major [Cooley anemia], glucose-6-phosphate dehydrogenase deficiency).

**2** This does not involve the destruction of red blood cells with subsequent liberation of bilirubin. **3** Oxygen-carrying ability is reflected by hemoglobin levels. **4** A decreased amount of bile pigment is liberated with this condition.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 6, Anemias and Blood Disorders, Data Base

119. **4** Because the spleen is highly vascular, hemorrhage may occur and abdominal distention results.

**1** Although an elevated temperature is common, usually it is not the result of infection; the incidence of infection is not higher after a splenectomy, except in children, and it will not occur in the immediate postoperative period. **2, 3** The incidence of this is not higher than for other abdominal surgery.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

120. **3** Postoperative pain will cause splinting, shallow breathing, and underaeration of the lung's left lower lobe because of close proximity of the spleen to the diaphragm.

**1, 2, 4** This is not specific to a splenectomy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

121. **2** Because of the location of the spleen, expansion of the thoracic cavity during inspiration causes pain at the operative site.

**1** The presence of crackles indicates accumulation of secretions, which is not an expected outcome; nursing care is designed to prevent this complication. **3** Because limited activity decreases oxygen consumption, shortness of breath is not a common complaint. **4** This is not expected; accumulation of secretions can be prevented by coughing and deep breathing.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

122. Answer: 1, 4, 5.

**1** Because of its great blood supply and general fragility, the spleen may hemorrhage, causing shock. **2** The immediate postoperative period is too soon for the client to exhibit signs of infection. **3** An intestinal obstruction is not associated with a splenectomy. **4** Because of its great blood supply and general fragility, the spleen may hemorrhage, causing abdominal distention. **5** Pulmonary complications may occur because the spleen is close to the diaphragm, resulting in defensive shallow breathing.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

123. Answer: 1, 3, 4.

**1** One cup of cooked spinach contains 6.4 mg of iron, which is necessary to produce red blood cells. **2** One cup of cooked broccoli contains 1.2 mg of iron; this is not the best source of iron. **3** Three ounces of beef liver contains 5.2 mg of iron; this is an excellent source of iron. **4** One cup of baked beans contains 8.2 mg of iron. **5** One half chicken breast contains 0.6 mg of iron.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

124. **2** When the spleen ruptures, internal loss of blood may be profound, resulting in shock.

**1** There are no signs that indicate that the respiratory rate is increased. **3** Although anxiety can cause hyperventilation, resulting in light-headedness, the data do not indicate that the client is anxious or has an increased respiratory rate. **4** These clinical findings are not inclusive enough to indicate infection.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Anemias and Blood Disorders, Nursing Care

# Respiratory System

125. Answer: 5, 2, 3, 4, 1.

5 Data collection precedes implementation. 2 IV access is necessary for emergency administration of medications, but cannot be initiated until the nurse has gathered some data (e.g., client may have shunt for dialysis in an arm, which would preclude use of that arm). 3 A sputum for culture and sensitivity should be obtained before antibiotic administration. 4 The antibiotic should be started as soon as possible to treat the pneumonia. 1 Peak and trough levels can only be done when the client has been receiving the medication.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pneumonia, Data Base

126. Answer: 25 gtt/minute. Use the following formula to solve this problem.

$$\text{Drops per minute} = \frac{\text{total mL to be infused (150)} \times \text{drop factor (15)}}{\text{total time in minutes (90)}}$$

$$\frac{150 \times 15}{90} = \frac{2250}{90} = 25 \text{ gtt/minute}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Fluid, Electrolyte, and Acid-Base Balance, General Nursing Care of Clients with Fluid and Electrolyte Problems

127. 2 The residual volume is the amount of air remaining in the lungs after maximum exhalation.

1, 3, 4 Usually this is under the individual's control. The force exerted by the abdominal thrust surpasses that which the individual is voluntarily capable of exerting.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Abdominal Thrust

128. 1 Tidal volume (TV) is defined as the amount of air exhaled after a normal inspiration.

2 This is the expiratory reserve volume (ERV). 3 This is the residual volume (RV). 4 The volume of air that can be forcibly inspired over and above a normal inspiration is the inspiratory reserve volume (IRV).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Review of Anatomy and Physiology, Physiology of Respiration

129. 1 The client should exhale before inhaling slowly and deeply through the spirometer

to maximize lung expansion.

**2** Sitting in a chair will facilitate diaphragmatic excursion and help maximize lung expansion. **3** Coughing will help remove secretions mobilized by use of a spirometer. **4** The client's lips must form a seal around the mouthpiece to measure the volume of air inhaled.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Chest Physiotherapy, Nursing Care

**130. 1** The tidal volume is the amount of air inhaled and exhaled while breathing normally.

**2** This is air that can be forcibly expired after maximum inspiration. **3** This is the maximum amount of air that can be expired after a normal expiration. **4** This is the maximum amount of air that can be inspired after a normal inspiration.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Review of Anatomy and Physiology, Physiology of Respiration

**131. 3** The lower the  $PO_2$  and the higher the  $PCO_2$ , the more rapidly oxygen dissociates from the oxyhemoglobin molecule.

**1** The pH will decrease with an increase in  $CO_2$  pressure. **2** An increase in  $PO_2$  will not increase oxygen dissociation from hemoglobin. **4** Oxygen dissociation will decrease with an increase in  $HCO_3$ .

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Review of Anatomy and Physiology, Physiology of Respiration

**132. 1** The negative pressure from suctioning removes oxygen as well as secretions; suction should be applied only after the catheter is inserted and is being withdrawn.

**2** This is too long; suctioning should be limited to 10 seconds. **3** Lubrication will facilitate insertion and minimize trauma; it will not prevent hypoxia. **4** The use of a sterile catheter helps prevent infection, not hypoxia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Suctioning of Airway

**133. 2** This client is more mobile and will benefit from a less restrictive form of oxygen administration. The client will be able to talk without the impediment of a mask.

**1** An upper respiratory infection causes nasal mucosal edema; the mucous membranes may be irritated by the nasal prongs, and the effectiveness of nasal oxygen may be diminished. **3** One nare is blocked by the nasogastric tube. The effectiveness of nasal cannula oxygen may be diminished. **4** If the client is a mouth breather, the effectiveness of nasal cannula oxygen may be diminished.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Oxygen Therapy

**134. 2** The orthopneic position is a sitting position that permits maximum lung expansion for gaseous exchange; it also enables the client to press the lower chest or abdomen against the overbed table, which increases pressure on the diaphragm to help with

exhalation, reducing residual volume.

**1** This position does not permit the diaphragm to descend by gravity, and pressure of the abdominal organs against the diaphragm limits its movement. **3, 4** This position does not maximize lung expansion to the same degree as the orthopneic position.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Review of Anatomy and Physiology, Physiology of Respiration

**135. 4** Because atelectasis involves collapsing of alveoli distal to the bronchioles, breath sounds are diminished in the lower lobes.

**1** The client will have rapid, shallow respirations to compensate for poor gas exchange. **2** Atelectasis results in an elevated temperature. **3** Atelectasis results in a loose, productive cough.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Review of Anatomy and Physiology, Physiology of Respiration

**136.** The nurse should palpate the area around a chest tube insertion site for the presence of a crackling sensation felt beneath the fingertips (crepitus), indicating that air is trapped in the tissues. Also, the chest tube insertion site should be assessed for an adequate seal.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Procedures, Chest Tubes

137. **1** Air rises and is removed via a tube inserted in the upper intrapleural space. **2** This is accomplished by the tube placed at the base of the lung; fluid flows toward the base via gravity. **3** This will cause, not prevent, a pneumothorax. **4** Medication will not be instilled into the intrapleural space in this situation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Procedures, Chest Tubes

138. **1** Subcutaneous emphysema occurs when air leaks from the intrapleural space through the thoracotomy or around the chest tubes into the soft tissue; crepitus is the crackling sound heard when tissues containing gas are palpated.

**2** These are unrelated to crepitus. Crackles and rhonchi occur within the lung; subcutaneous emphysema occurs in the soft tissues. **3** This is related to prolonged trapping of air in the alveoli associated with emphysema, a chronic obstructive pulmonary disease. **4** This is unrelated to subcutaneous emphysema, which involves gas in the soft tissues from a pleural leak.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Procedures, Chest Tubes

139. **4** Once the drainage tube is patent, the fluctuation in the water column will resume; a lack of fluctuation because of lung reexpansion is unlikely 36 hours after a traumatic open chest injury.

**1** This may be done eventually, but this is not the priority at this time. **2** This is unnecessary at this time; the chest tube is occluded, and nursing intervention should be attempted first. **3** This will compromise aeration of the unaffected lung.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Chest Tubes

140. **3** This is one method for the client to communicate after a laryngectomy; speech is produced by expelling swallowed air across constricted tissue in the pharyngoesophageal segment.

**1** This is used for individuals who wish to communicate with someone who is deaf. **2** Although this may be an adjunct to verbal speech, it should not be the primary means of communication. **4** This does not allow for the spontaneous communication possible with a tracheoesophageal puncture, esophageal speech, or an electrolarynx.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Cancer of the Larynx, Nursing Care

141. **1** Water sports pose a severe threat; should water enter the stoma, the client will drown.

**2** This is not harmful; as long as there is no obstruction, adequate oxygen will be available because the respiratory rate will increase. **3** Pillows are not contraindicated, although care should be taken not to occlude the airway by any bedding while asleep. **4** Humidity is desirable and helpful in keeping secretions liquefied.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Cancer of the Larynx, Nursing Care

142. **2** Fluids will replace fluid loss from fever and decrease viscosity of secretions. **1** Capillary refill relates to peripheral tissue perfusion. **3** There are no data to suggest that secretions are blocking the airway; there is no support that suctioning is needed. **4** High concentrations of oxygen generally are not administered to clients with COPD; traditionally the reason given for this was clients with COPD become desensitized to carbon dioxide as a respiratory stimulus so that reduced oxygen levels act as the stimulus and high concentrations of oxygen levels may actually depress respirations. The newer theory suggests that the hypoxic drive is valid for a small number; the majority of cases involve the Haldane effect: as hemoglobin molecules become more saturated with oxygen, they are unable to transport carbon dioxide out of the body, leading to hypercapnia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Obstructive Airway Disease, Nursing Care

143. **4** Streptococcal organisms are present on the skin, in the mucous membranes, and in the environment at all times. The most frequent portals of entry are the respiratory tract and breaks in the skin; once in the body, the organisms can be transmitted to the heart and kidneys via the circulation.

**1** All are caused by streptococci. **2** Vaccinations are not available for most of these conditions; there is an antitoxin for scarlet fever, but antibiotics are now used. **3** Bacteria are not classified as parasites.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Review of Microorganisms

144. **1** Furosemide (Lasix) acts on the loop of Henle by increasing the excretion of chloride and sodium.

**2** Although used in the treatment of edema and hypertension, this drug is not as potent as furosemide. **3** This is a potassium-sparing diuretic; it is less potent than thiazide diuretics. **4** This drug is used in the treatment of glaucoma to lower intraocular pressure.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pulmonary Edema, Data Base

145. **2** Coughing is needed to raise secretions for expectoration.

**1** Oxygen will not mobilize the secretions. **3** A sitting position will allow secretions to remain in the lungs unless coughing is encouraged. **4** Rest should be encouraged only after coughing to bring up secretions mobilized by postural drainage.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Chest Physiotherapy

146. **3** The etiology of a spontaneous pneumothorax is commonly the rupture of blebs on the lung surface. Blebs are similar to blisters, but are filled with air.

**1** Pleural friction rub results in pain on inspiration, not a pneumothorax. **2** A tracheoesophageal fistula causes aspiration of food and saliva, resulting in respiratory distress. **4** The client has no history of trauma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Pneumothorax/Chest Injury, Data Base

147. **2** Loss of alveolar surface area causes retention of carbon dioxide, which, after exhausting the available bicarbonate ions functioning as buffers, will cause a lower pH (respiratory acidosis).

**1** Tissue necrosis results from localized tissue anoxia and will not cause the systemic response of respiratory acidosis. **3** Normal oxygen saturation of hemoglobin is 95% to 100%, so this is not a sign of acidosis. **4** An increased respiratory rate may lead to respiratory alkalosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Obstructive Airway Disease, Data Base

148. **4** Oxygen is supplied to prevent anoxia, but not in high concentrations without an order. In an individual with emphysema, a low oxygen level, not high carbon dioxide level, may be the respiratory stimulus. Another reason is the Haldane effect: as hemoglobin molecules become more saturated with high concentrations of oxygen, they are unable to transport carbon dioxide out of the body, leading to hypercapnia.

**1** This might increase the risk for mediastinal shift and interfere with expansion of the unaffected lung. **2** Although oxygen is administered to prevent hypoxia, this concentration is too high for a client with emphysema because it may precipitate carbon dioxide narcosis. **3** This dependent action requires orders as to specific electrolytes.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Obstructive Airway Disease, Data Base

149. **1** As a person with a tear in the lung inhales, air moves through that opening into the intrapleural space. This creates a positive pressure and causes partial or complete collapse of the lung.

**2** Mediastinal shift occurs toward the unaffected side. **3** This is normal; with a pneumothorax there is a loss of intrathoracic negative pressure. **4** This is not an impending problem.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pneumothorax/Chest Injury, Data Base

150. Answer: 2, 3.

**1** Bloody vomitus is unrelated to pneumothorax. **2** With the reduction of surface area for gaseous exchange the client experiences shortness of breath, tachycardia, and rapid, shallow respirations. **3** Sudden chest pain occurs on the affected side; it may also involve the arm and shoulder. **4** Decreased chest motion occurs because of failure to inflate the involved lung. **5** The shift toward the unaffected side results from pressure from the pneumothorax.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Pneumothorax/Chest Injury, Data Base

151. **3** The water seal chamber acts as a one-way valve to allow air from the pleural space

to escape into the suction chamber but prevent a backflow of air from within the system to the client.

**1** This chamber provides suction control. **2, 4** This chamber collects drainage from the client.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Related Procedures, Chest Tubes

**152. 3** Destruction of the alveolar walls leads to diminished surface area for gaseous exchange and increased carbon dioxide levels in the blood.

**1** Pleural effusion occurs when there is seepage of fluid into the intrapleural space; this does not occur with emphysema. **2** Infectious obstructions occur in conditions in which microorganisms invade lung tissue; emphysema is not an infectious disease. **4** Muscle paralysis may occur in diseases affecting the neurologic system; emphysema does not affect the neurologic system; therefore, it is not a neurologic disease.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Obstructive Airway Disease, Data Base

**153.** Answer: 3, 4.

**1** Rising carbon dioxide levels cause lethargy rather than anxiety. **2** Cyanosis is caused by excessive amounts of reduced oxyhemoglobin; because oxygen is being administered, cyanosis will not occur. **3** Some clients with COPD respond only to the chemical stimulus of low oxygen levels. Administration of high concentrations of oxygen to these individuals will eliminate the stimulus to breathe, leading to decreased respirations, lethargy, and drowsiness. Clients with COPD experience the Haldane effect: as hemoglobin molecules become more saturated with oxygen, they are unable to transport carbon dioxide out of the body, leading to hypercapnia. **4** Increased levels of carbon dioxide depress the central nervous system, causing mental confusion and a lowered level of consciousness. **5** High concentrations of oxygen may eliminate the stimulus to breathe, so the respiratory rate will decrease, not increase.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Obstructive Airway Disease, Data Base

**154. 1** Loss of elasticity causes difficult exhalation, with subsequent air trapping. Clients who have emphysema are taught to use accessory abdominal muscles and to breathe out through pursed lips to help keep the air passages open until exhalation is complete.

**2** Expiration is difficult because of air trapping and poor elasticity. **3** There will be decreased vital capacity. **4** Diaphragmatic breathing is a learned mechanism that is beneficial.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Obstructive Airway Disease, Nursing Care

**155. 1** These drugs cause increased heart contraction (positive inotropic effect) and increased heart rate (positive chronotropic effect). If toxic levels are reached, side effects occur and the drug should be withheld until the health care provider is notified.

**2** This is false reassurance and a false statement. **3, 4** Controlled breathing may be helpful in allaying a client's anxiety; however, the drug may be producing adverse

effects and should be withheld.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 7, Related Pharmacology, Bronchodilators and Antiasthmatics

156. **2** Clients with asthma use metered-dose inhalers to administer medications prophylactically and/or during times of an asthma attack; this is an important skill to have before discharge.

**1** Pulse oximetry is rarely conducted in the home; home management usually includes self-monitoring of the peak expiratory flow rate. **3** Although this is important, it is not the priority; during a persistent asthma attack that does not respond to planned interventions, the client should go to the emergency department of the local hospital or call 911 for assistance. **4** Not all asthma is associated with food allergies.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Pharmacology, Bronchodilators and Antiasthmatics

157. **1** Hypersecretion of the mucous glands provides an excellent warm, moist medium for microorganisms.

**2** Asthma is not a disease that is voluntarily controlled. **3** Coughing must be encouraged; it prevents retention of mucus, which is an excellent medium for microorganisms. Excessive secretions also limit gaseous exchange. **4** The anesthesiologist will make recommendations about the type of anesthesia best suited for the client and the surgical procedure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Obstructive Airway Disease, Nursing Care

158. **3** A peak flow meter measures the peak expiratory flow rate, the maximum flow of air that can be forcefully exhaled in 1 second; this monitors the pulmonary status of a client with asthma.

**1** The peak flow measurement should be done daily in the morning before the administration of medication or when experiencing dyspnea. **2** The client should be standing or sitting upright. **4** This will interfere with an accurate test; the mouthpiece should be in the mouth between the teeth with the lips creating a seal around the mouthpiece.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Obstructive Airway Disease, Nursing Care

159. **3** Pressure within the pleural cavity causes a shift of the heart and great vessels to the unaffected side. This not only decreases the capacity of the unaffected lung but also impedes the filling of the right side of the heart and leads to a decreased cardiac output.

**1** This complication might occur with severe chest trauma, not with a mediastinal shift. **2** Infection is not caused by a mediastinal shift. **4** The volume of the unaffected lung may decrease because of pressure from the shift.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 7, Pneumothorax/Chest Injury, Data Base

160. **1** Fluctuations occur with inspiration and expiration until the lung is fully expanded. If these fluctuations do not occur, the chest tube may be clogged or kinked; coughing should be encouraged.

**2** The client may not be agitated; morphine depresses respirations and usually is avoided. **3** The binder does not prevent tension on the tube; its use is contraindicated because it limits thoracic expansion. **4** The tube should be clamped only if ordered or if an air leak is suspected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 7, Related Procedures, Chest Tubes

161. **2** Leakage of air into the subcutaneous tissue is evidenced by a crackling sound when the area is gently palpated. This is referred to as crepitus.

**1** Although hemostats should be readily available for any client with chest tubes in the event of a break in the drainage system, clamping the tube is not otherwise necessary and could cause backpressure. **3** The dressing is not routinely changed to minimize the risk for pneumothorax. **4** The system is kept closed to prevent the pressure of the atmosphere from causing a pneumothorax; drainage levels are marked on the drainage chamber to measure output. The chambers are not emptied; if they are filled, a new system will be attached.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 7, Related Procedures, Chest Tubes

162. **1** Clients who have had joint replacement have decreased mobility; they are at risk for developing thrombophlebitis, which may lead to pulmonary embolism if the clot becomes dislodged into the circulation.

**2, 3** This is not associated with an increased risk for pulmonary embolism. **4** This leads to a decreased ability to clot, so it increases the risk of bleeding but decreases the risk of a thrombus or embolus.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 7, Pulmonary Embolism and Infarction, Data Base

163. **1** This client has two risk factors for the development of pulmonary embolism: obesity and leg trauma.

**2** This client has one risk factor for the development of pulmonary embolism: pregnancy. **3** This client has one risk factor for the development of pulmonary embolism: diabetes. **4** This client has no risk factors for the development of pulmonary embolism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 7, Pulmonary Embolism and Infarction, Data Base

164. **2** Oral intake should not be attempted until return of the gag reflex because the client could aspirate.

**1** Although some slight irritation may occur following this test, there are usually no

painful sequelae; oral intake would not be withheld because of painful swallowing, although the consistency of food may be changed. **3, 4** This is not a correct statement; there are additional factors that must be considered.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Procedures, Bronchoscopy

165. **3** With the head elevated, rather than horizontal or dependent, fluid will not collect in the interstitial spaces around the trachea.

**1, 2, 4** This may cause aspiration if the gag reflex has not returned.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Bronchoscopy

166. **3** Cancerous lesions in the pleural space increase the osmotic pressure, causing a shift of fluid to that space.

**1** Excessive intake is usually balanced by increased urine output. **2** Inadequate chest expansion results from pleural effusion and is not the cause of it. **4** A bronchoscopy does not involve the pleural space.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 7, Malignant Lung Tumors, Data Base

167. **3** Cavities are evident on radiograph. Necrotic lung tissue may liquefy, leaving a cavity (cavitation), or granulose tissue can surround the lesion, become fibrous, and form a collagenous scar around the tubercle (Ghon tubercle).

**1** This is determined by a positive reaction to a tuberculin skin test, not on radiograph; a skin test only determines the presence of antibodies; it does not confirm active disease. **2** This may be determined by a sputum culture, not by radiograph. **4** Microscopic primary infection may be so small it does not appear on a radiograph.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 7, Pulmonary Tuberculosis, Data Base

168. Answer: 2, 3, 5, 1, 4.

**2** Tuberculosis is transmitted via microorganisms that travel with air currents. The client should be placed in a room that has at least six exchanges of air per hour and is ventilated to the outside. Care givers should wear a high-efficiency particulate air respirator. **3** A chest x-ray study is the quickest way to determine the presence of suspicious lesions in the lung. **5** A purified protein derivative (PPD) test can be read in 48 to 72 hours. **1** A positive culture may not develop for 3 to 6 weeks. **4** The Department of Health should be notified when the diagnosis of tuberculosis is confirmed.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 7, Pulmonary Tuberculosis, Data Base

169. Answer: 1, 3, 4.

**1** The general adaptation syndrome is activated in response to *Mycobacterium tuberculosis* (a gram-positive, acid-fast bacillus), causing an infectious response, which contributes to fatigue; the altered gas exchange also contributes to fatigue because it decreases the available oxygen. **2** Anorexia, not polyphagia, is a common response to most

infections. **3** Hemoptysis is a response caused by damage to lung tissue; it is associated with more advanced tuberculosis. **4** Night sweats are a common symptom of infectious diseases; the infectious process influences the temperature-regulating center of the brain that promotes peripheral vasodilation and increased permeability of the peripheral blood vessels, resulting in diaphoresis. **5** A black, hairy tongue is associated with fungal infection often seen with antibiotic therapy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Pulmonary Tuberculosis, Nursing Care

170. **1** Rifampin (Rifadin) causes a reddish orange discoloration of secretions such as urine, sweat, and tears.

**2** While liver enzymes should be monitored because of the risk of hepatitis, this action is not addressing the client's statement. **3** This is indicated for renal calculi, which are not related to rifampin. **4** The medication, not food, is responsible for the urine color.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Pharmacology, Antituberculars

171. **3** The absence of bacteria in the sputum indicates that the disease can no longer be spread by the airborne route.

**1** Treatment is over an extended period; eventually the client may not have an active disease, but still remains infected. **2** Once an individual has been infected, the test will always be positive. **4** This is not evidence that the disease cannot be transmitted.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Pulmonary Tuberculosis, Nursing Care

172. Answer: 1, 2, 5.

**1** Bed rest is recommended because lymphatic flow increases with activity. **2** A chest tube drains the leaking chyle from the thoracic area. **3** A high-fat diet is contraindicated because it increases the production and flow of chyle. **4** A rectal tube has no relationship to the drainage of chyle from the thoracic area. **5** TPN boosts immune defenses, provides nutrition, and decreases thoracic duct flow.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Cancer of the Larynx, Data Base

173. **2** The client has a high risk for airway obstruction from the edema; restlessness and dyspnea indicate cerebral hypoxia.

**1** Crackles come from the alveoli, part of the lower airway; the surgery involves the upper airway. There is no evidence of abdominal distention. **3** This is unimportant; the pharyngeal opening is sutured closed and a tracheal stoma is formed; the trachea is anatomically separate from the esophagus. **4** Cloudy drainage may indicate infection; however, this is not an immediate postoperative complication.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Cancer of the Larynx, Nursing Care

174. **4** Secretions are increased because of alterations in structure and function. A patent airway must be maintained.

**1** Whispering can put tension on the suture line; initially nonverbal and written forms of

communication should be encouraged. **2** The outer tube is not removed because the stoma may close. **3** The orthopneic position may cause neck flexion and block the airway.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Cancer of the Larynx, Nursing Care

175. **2** During suctioning of a client's secretions, negative pressure (suction) should not be applied until the catheter is ready to be drawn out because, in addition to the removal of secretions, oxygen is being depleted.

**1** The sterility of the catheter can be maintained during one suctioning session; a new sterile catheter should be used for each new session of suctioning. **3** A cough reflex may be absent or diminished in some clients; the catheter should be inserted approximately 12 cm (4 to 5 inches) or just past the end of the tracheostomy tube. **4** The inner cannula is not removed during suctioning; it may be removed during tracheostomy care.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Suctioning of Airway

176. **2** Expectoration of blood is an indication that the lung itself was damaged during the procedure; a pneumothorax or hemothorax may occur.

**1** It is too soon after a thoracentesis for an infection to develop. This is important for the client to assess for several days after the procedure. **3** Increased breath sounds are anticipated because the lung is closer to the chest wall after the fluid in the pleural space is removed. **4** A decreased rate may indicate improved gaseous exchange and is not evidence that the client is in danger.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Procedures, Thoracentesis

177. **2** Suctioning also removes oxygen, which can cause cardiac dysrhythmias; the nurse should try to prevent this by hyperoxygenating the client before and after suctioning.

**1** Suction should be applied only while removing the catheter to prevent trauma to the trachea. **3** Suction only as needed; excessive suctioning irritates the mucosa, which increases secretion production. **4** This kind of movement may cause tracheal damage.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Suctioning of Airway

178. Answer: 1, 5.

**1** This is an excessive amount of drainage; 80 to 120 mL of drainage is expected in the first 24 hours postoperatively; vital signs should be taken to determine the systemic response to blood loss. **2** A fresh postoperative dressing should not be disturbed because the manipulation can cause further bleeding; it can be reinforced by the nurse if needed; the health care provider should change the first dressing. **3** Pressure should be applied in the event of life-threatening hemorrhage, but the blood is contained within the drainage system; appropriate intervention can prevent hemorrhage. **4** The head of the bed is kept elevated after neck surgery to decrease edema, which may compromise the airway. **5** This is an excessive amount of drainage; the health care provider should be notified.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Cancer of the Larynx, Nursing Care

179. Answer: 3, 4.

**1** Vomiting is associated with a GI obstruction or cancer. **2** Chest pain is associated with a variety of respiratory conditions; it is not specific to tuberculosis. **3** Erosion of lung tissue causes blood in the sputum, a classic sign of tuberculosis. **4** Increased body temperature causes profuse diaphoresis, a classic sign of tuberculosis. **5** Bilateral crackles are associated with excess fluid volume.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Pulmonary Tuberculosis, Nursing Care

180. **Answer: 2 mL.** First convert 1 g to its equivalent of 1000 mg and then use the “Desire over Have” formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire}}{\text{Have}} = \frac{1000 \text{ mg}}{500 \text{ mg}} = \frac{x \text{ mL}}{1 \text{ mL}}$$

$$500 x = 1000$$

$$x = 1000 \div 500$$

$$x = 2 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

181. **2** Atelectasis with impaired gas exchange is a major complication when clients use shallow breathing to avoid pain; coughing and deep breathing help mobilize secretions.

**1** This may impede deep breathing and coughing, which help prevent atelectasis. **3** Analgesics are essential to diminish pain caused by breathing and help motivate the client to cough and deep breathe. **4** The prone position may diminish breathing for both lungs and is contraindicated.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pneumothorax/Chest Injury, Nursing Care

182. **3** Decreased oxygen to the vital centers in the brain results in restlessness and confusion.

**1** This is a late sign of respiratory failure. **2** Tachycardia, not bradycardia, will occur as a

compensatory mechanism to help increase oxygen to body cells. **4** This occurs with fluid volume excess (e.g., pulmonary edema).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Obstructive Airway Disease, Nursing Care

183. **3** Because the mask cannot be worn when eating, the client may become hypoxic. A nasal cannula may be needed to deliver oxygen while the client is eating.

**1** Nasal drying usually is not a problem with the use of a Venturi mask. Nasal drying occurs more frequently when a nasal cannula is used. **2** Too tight a fit is uncomfortable and may cause damage to the skin. The mask should fit snugly, but not be too tight. **4** The oxygen should be set at the level ordered by the health care provider.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Oxygen Therapy

184. Answer: 3, 5.

**1** The oxygen source does not need to be higher than the client's airway because its flow does not depend on gravity. **2** The liter flow is adjusted according to the flow rate that corresponds to the percent of oxygen prescribed; this usually is identified on the base of each adaptor. **3** The adaptor's orifices allow room air to combine with the oxygen to provide a specific oxygen concentration. **4** A Venturi mask does not have a bag like a rebreather mask. **5** A Venturi mask uses one of several adaptors, which are usually color-coded, to deliver the prescribed  $\text{Fio}_2$ .

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Oxygen Therapy

185. **1** Oxygen via nasal cannula is the most comfortable and least intrusive, because the cannula extends minimally into the nose.

**2** This is intrusive and may increase anxiety. **3, 4** This method is oppressive, and clients complain of feeling "suffocated" when it is used.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation, **Reference:** Ch 7, Related Procedures, Oxygen Therapy

186. **2** This decrease in  $\text{PaO}_2$  indicates respiratory failure; it warrants immediate medical evaluation.

**1** While this may ultimately be ordered, it is not an action the nurse should take without first notifying the health care provider. **3** This is inappropriate and will compound the problem; the  $\text{PaO}_2$  is a measure of the pressure (tension) of oxygen in the plasma; this level is decreased in individuals who have perfusion difficulties, such as those with pneumonia. **4** This is negligent and dangerous; a falling  $\text{PaO}_2$  level is a serious indication of worsening pulmonary status and must be addressed immediately; drawing another blood sample and waiting for results will take too long.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Acute Respiratory Distress Syndrome, Data Base

187. **4** Mechanical ventilation with positive end-expiratory pressure (PEEP) will help prevent alveolar collapse and improve oxygenation.

**1** Fluid is not in the pleural space, so this is not indicated. **2, 3** This is contraindicated because of severe hypotension from the fluid shift into the interstitial spaces in the lungs.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Mechanical Ventilation

188. **1** Secretions in the airway will increase pressure by blocking air flow and must be removed.

**2** The nurse must identify/correct the problem so that the set tidal volume can be delivered. **3** Connections that are not intact would cause a low-pressure alarm. **4** Arterial blood gases (ABGs) are used to assess client status, but are not taken each time a pressure alarm is heard.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Mechanical Ventilation

189. Answer: 1, 2, 3, 4, 5.

**1** Obtaining the vital signs first provides a baseline for evaluating the client's response to suctioning if it is performed. **2** Next, the nurse should assess the client's lung sounds to determine if suctioning is needed and to provide a baseline for comparison to evaluate the effectiveness of the intervention. **3** Hyperoxygenation for 30 seconds before suctioning compensates for the removal of oxygen during the suctioning process, but it is done after auscultation of breath sounds. **4** Suctioning occurs after the lung sounds have been auscultated and the client has been preoxygenated; the catheter is inserted into the endotracheal tube. Suctioning for less than 15 seconds is appropriate because suctioning for longer than this irritates the mucosal lining of the respiratory tract as well as induces hypoxia. **5** This is done near the end of the procedure when the catheter is rotated and removed.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Related Procedures, Suctioning of Airway

190. **2** Surveillance and containment are the first lines of defense against outbreaks of infectious disease.

**1** While it is important to have adequate supplies of antibiotics to treat illness, antibiotics do not prevent illness; vaccines should be administered to protect vulnerable populations. **3** Vaccines should be used to protect all vulnerable populations such as older adults, immunocompromised individuals, those with chronic medical conditions, those caring for individuals at high risk, and health care providers, not just children; some influenza vaccines are not administered to children younger than 5 years of age. **4** Most vaccination programs inoculate clients during the months of October and November in preparation for the influenza season, which is generally from November through March.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pneumonia, Data Base

191. **4** Honesty and openness are essential to understand the extent of the problem so

that an appropriate local and global response can be mobilized to limit emerging pandemics.

**1, 2, 3** While this helps, it can only be done in response to detection and reporting of the presence of an emerging health problem. In response to the severe acute respiratory syndrome (SARS) epidemic of 2002, the International Air Transport Association began work to standardize procedures that address passenger screening and the accurate and quick tracking of passenger travel.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 7](#), Pneumonia, Data Base

# Gastrointestinal System

192. **2** In addition to this recommendation, the American Cancer Society (ACS) also recommends a colonoscopy every 10 years, flexible sigmoidoscopy every 5 years, double-contrast barium enema every 5 years, or CT colonography (virtual colonoscopy) every 5 years. If any of these tests (other than the colonoscopy) are positive, a colonoscopy should be done.

**1** The ACS recommends that women have an annual mammography after age 40 years. Women with a risk greater than 20% (based on family history, genetic tendency, or certain other factors) should have an MRI and mammography yearly at 30 or sooner based on personal circumstances or preference. A clinical breast exam should be done starting at 20 and through the 30s every 3 years. **3** The ACS recommends that breast self-examinations be performed monthly beginning at age 20 years if a person chooses to do so; it is recommended that women be instructed about the potential benefits and limitations related to breast self-examination. **4** After a discussion with a health care provider, digital rectal examinations and PSA screening should be done annually at age 50 for men who are expected to live at least 10 years. African-American men and men with a father or brother with a history of prostate cancer before the age of 65 should begin testing at 45 years of age. Men at even a greater risk (brother or father with a diagnosis of prostate cancer at an early age) should begin testing at age 40. Screening should take place every 3 years with a PSA of less than 2.5 ng/mL and yearly for a PSA equal to or more than 2.5 ng/mL.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation,

**Reference:** Ch 8, Cancer of the Small Intestine, Colon, or Rectum, Data Base

193. **4** Orange juice has a higher proportion of simple sugars, which are readily available for conversion to energy.

**1** Milk contains fat and protein, which require a longer digesting time, and lactose, which is a disaccharide. **2** Bread contains carbohydrates, which require a longer time to digest because they must be converted to simple sugars. **3** Chocolate candy bars do not contain the high proportion of simple sugars found in orange juice; they also contain fat, which takes longer to digest.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 8, Review of Nutrients, Sources of Energy

194. **4** Vitamin K is synthesized by intestinal bacteria but is also found in large quantities in green leafy vegetables.

**1** Vitamin K is found only in specific foods, not a wide variety. **2** Vitamin K is not easily absorbed; it is fat-soluble and requires bile salts for its absorption. **3** It is synthesized by intestinal bacteria, so a natural deficiency does not occur.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 8, Review of Nutrients, Vitamins

195. **1** Milk and milk products are not tolerated well because they contain lactose, a sugar that is converted to galactose by lactase.

**2** Sucrase assists in the digestion of sucrose, which is not a milk sugar. **3** Maltase assists in the digestion of maltose, which is not a milk sugar. **4** Amylase assists in the digestion of starch, which is not a milk sugar.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Review of Chemical Principles, Carbohydrates

196. **4** A triglyceride is composed of three fatty acids and a glycerol molecule. When energy is required, the fatty acids are mobilized from adipose tissue for fuel. The nurse needs to consider that a client who is cachectic will have limited reserves to meet energy needs.

**1** This is not the function of adipose tissue; its main function is storage. **2** This is not a function of adipose tissue; cholesterol is produced in the liver. **3** This is not the function of adipose tissue in fat metabolism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Functions of the Gastrointestinal System, Metabolism

197. **3** Saturated fats, found in animal tissue, are more dense than unsaturated fats, which are found in vegetable oils.

**1, 2, 4** This characteristic of food has no bearing on fat saturation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Chemical Principles, Types of Compounds, Lipids

198. **3** Red meat is high in dense saturated fats and should be avoided.

**1** Fruits do not contain saturated fats. **2** Grains do not contain saturated fats. **4** Vegetable oils contain unsaturated fats.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Review of Diets

199. **4** Cholesterol is an essential structural and functional component of most cellular membranes. That it is associated with atherosclerotic plaques does not detract from its essential functions.

**1** Cholesterol is not necessary for blood clotting; calcium and vitamin K are necessary. **2** Cholesterol is not essential for bone formation; calcium, phosphorus, and calciferol are necessary. **3** Cholesterol is not involved in muscle contraction; potassium, sodium, and calcium are necessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Chemical Principles, Types of Compounds, Lipids

200. **2** The body does not synthesize these amino acids; they must be ingested in the diet.

**1** The essential amino acids cannot be made by the body. **3, 4** All amino acids are needed for metabolism; however, arginine and histidine are necessary for growth, but not

during adulthood; essential amino acids cannot be synthesized by the body.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 8, Review of Chemical Principles, Types of Compounds, Amino Acids

201. 3 Fruits contain less natural sodium than do other foods.

1 Milk is higher in natural sodium than is fruit. 2 Meat is higher in natural sodium than is fruit. 4 Vegetables are higher in natural sodium than is fruit.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Review of Diets

202. 2 Vitamin A is a fat-soluble vitamin that accumulates in the body and is not significantly excreted even if extremely large amounts are ingested. After prolonged ingestion of extremely large doses, toxic effects (e.g., irritability, increased intracranial pressure, fatigue, night sweats, and severe headache) can occur.

1 Vitamin A is toxic only after prolonged large dosages. 3 Vitamin A can be stored in the liver. 4 Vitamin A cannot be synthesized by the body.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 8, Review of Nutrients, Vitamins

203. Answer: 1, 5.

1 Yellow/orange vegetables contain large quantities of the pigments alpha-, beta-, and gamma-carotene; beta-carotene is the major chemical precursor of vitamin A in human nutrition. Cantaloupe, sweet potatoes, and apricots also are high in vitamin A.

2 Oranges are considered a good source of both vitamin C and potassium. 3 Tomatoes are a good source of vitamin C. 4 Levels of vitamin A are higher in whole milk than in skim milk. 5 Dark green leafy vegetables contain large quantities of the pigments alpha-, beta-, and gamma-carotene; beta-carotene is the major chemical precursor of vitamin A in human nutrition. Broccoli, cabbage, spinach, and collards also are high in vitamin A.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Nutrients, Vitamins

204. 4 Vitamin A is used in the formation of retinol, a component of the light-sensitive rhodopsin (visual purple) molecule.

1 Melanin is a pigment of the skin. 2 Vitamin A does not influence color vision, which is centered in the cones. 3 The cornea is a transparent part of the anterior portion of the sclera; a cataract is opacity of the usually transparent crystalline lens. Vitamin A does not prevent cataracts.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 8, Review of Nutrients, Vitamins

205. 3 The high-Fowler position promotes optimal entry into the esophagus aided by gravity.

1, 2 This position does not take full advantage of the effect of gravity. 4 This position will contribute to aspiration. The head of the bed should be raised, not lowered.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feeding)

206. **2** Small meals are not as psychologically overwhelming and do not upset the stomach easily. They are therefore better tolerated.

**1** Although this may be helpful, small, frequent meals is a better approach. **3** Administration of vitamins is a dependent nursing function; vitamins do not stimulate appetite. **4** This does not ensure adequate nutrition; if the portion size is decreased, frequency must be increased.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Stomach, Nursing Care

207. **1** Emptying the bladder before a paracentesis prevents its accidental puncture during the procedure.

**2, 4** No bowel preparation is indicated. **3** The client may eat and drink as tolerated.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Paracentesis

208. **4** Barium salts used in a GI series and barium enemas coat the inner lining of the GI tract and then absorb x-rays passing through. Thus, they outline the surface features of the tract on a photographic plate.

**1** Barium has no light-emitting properties. **2** Barium does not fluoresce. **3** Barium does not have the properties of a dye.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gastrointestinal Series

209. **1** To permit adequate visualization of the mucosa during the sigmoidoscopy, the bowel must be cleansed with a nonirritating enema before examination.

**2** The client does not drink such a substance in preparation for a sigmoidoscopy. **3** Because only the lower bowel is being visualized, withholding food is unnecessary; a laxative may be given the day before to limit fecal residue. **4** Collecting a stool specimen is not part of the procedure for a sigmoidoscopy.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gastrointestinal Series

210. **4** To promote understanding and allay anxiety, all diagnostic tests should be explained to the client.

**1, 2, 3** Preparations for tests may vary depending on the client's condition.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gastrointestinal Series

211. **2** For a high colonic enema, the fluid must extend higher in the colon. If the height of the enema fluid container above the anus is increased, the force and rate of flow also increase.

1 This is too low for a high cleansing enema. 3, 4 This is too high and may cause mucosal injury.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Enemas

212. 4 Administration of additional fluid when a client reports experiencing abdominal cramps adds to discomfort because of additional pressure. By clamping the tubing a few minutes, the nurse allows the cramps to subside and the enema can be continued.

1 Cramps are not a reason to discontinue the enema entirely; temporary clamping of the tubing usually relieves the cramps, and the procedure can be continued. 2 Slowing the rate decreases pressure but does not reduce it entirely. 3 This will reduce the flow of the solution, which will decrease pressure but not reduce it entirely.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Enemas

213. 2 A rise in the level of formula within the tube indicates a full stomach.

1 Passage of flatus reflects intestinal motility, which does not pose a potential problem. 3 A rapid inflow is the result of positioning the container too high or using a feeding tube with too large a lumen. 4 Epigastric tenderness is not necessarily caused by a full stomach.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feeding)

214. 2 X-ray verification of tube placement is required before anything is instilled into the nasogastric tube. Administering a feeding through a misplaced tube can cause the formula to enter the client's lungs.

1 This is unsafe. The normal saline will enter the client's lungs if the tube is in the wrong place. 3, 4 This is not a definitive way to ensure correct placement of the nasogastric tube. Once placement is verified by an x-ray, this method may be used before initiating a feeding.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feeding)

215. 1 The American Society for Parenteral and Enteral Nutrition (ASPEN) recommends that a gastric residual  $\geq 250$  mL should be checked again in 4 hours for critically ill clients and 6 to 8 hours in non-critically ill clients. If it is still  $\geq 250$  mL, the nurse should seek an order for a promotility agent. If the residual is  $>500$  mL, the nurse should hold the feeding until the following are accomplished: a gastrointestinal evaluation, assessment of glycemic control (hyperglycemia can cause decreased GI motility), minimization of sedation, and a prescription for a promotility agent if not already prescribed.

Recommendations indicate that an enteral feeding should not be stopped for a residual  $<500$  mL unless other signs of feeding intolerance are present (e.g., emesis, abdominal distention, constipation, uncomfortable feeling of fullness, abdominal pain or nausea).

2 This evaluates fluid balance and is best performed over a 24-hour period. 3 This is a method for evaluating tube placement. 4 Although weighing the client regularly is important to evaluate overall nutritional progress, it does not provide information about absorption of a particular feeding.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feeding)

216. 4 The increased osmolarity (concentration) of many formulas draws fluid into the intestinal tract, which can cause diarrhea; such feedings may need to be diluted initially until the client develops tolerance.

1 Formulas frequently have reduced fiber content. 2 Bacterial contamination is not a factor if the manufacturer's recommendations are followed. 3 Inappropriate positioning may increase the risk for aspiration, but it does not cause diarrhea.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feedings)

217. 4 Because the cardiac sphincter of the stomach is slightly opened to admit the nasogastric tube, rapid instillation may result in regurgitation.

1 Distention is diminished by avoiding the instillation of air with the feeding. 2 The speed of a feeding does not cause flatulence, but the administration of air may. 3 This may or may not decrease indigestion.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gavage (Tube Feedings)

218. 2 Vomiting may result in aspiration of vomitus, because it cannot be expelled; this may cause pneumonia or asphyxia.

1, 3, 4 This generally is not a life-threatening problem.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Fracture of the Jaw, Nursing Care

219. 3 Pain and swelling should subside before 1 week postoperatively. Continued pain may indicate infection.

1 This is expected because of dried blood in the oral cavity. 2 This may occur because of generalized trauma resulting from surgery and is expected. 4 This is expected.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Fracture of the Jaw, Nursing Care

220. Answer: 2, 5, 6.

1 Halitosis is not an early sign of or specific to cancer of the mouth. 2 Leukoplakia are white, thickened patches that tend to fissure and become malignant; ulcerations in the mouth or on the tongue may indicate cancer. 3 Bleeding gums occur in gingival diseases. 4 Pain associated with cancer of the tongue does not radiate to the substernal area. 5 Taste buds in the tongue may be impaired, resulting in alterations in taste. 6 Regional lymph nodes enlarge as cancer cells begin to metastasize.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Cancer of the Oral Cavity, Data Base

221. 4 A large amount of alcohol ingestion predisposes an individual to the development of oral cancer because it is a mucosal irritant.

1, 2, 3 This has no effect on the development of oral cancer.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 8, Cancer of the Oral Cavity, Data Base

222. **2** This elevates the upper torso and minimizes reflux of gastric contents.

**1** Increasing the content of the stomach before lying down will aggravate the symptoms associated with gastroesophageal reflux. **3** This will have no effect on the reflux of gastric contents. **4** The effect of antacids is not long-lasting enough to promote a full night's sleep; sodium bicarbonate is not recommended as an antacid.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 8, Gastroesophageal Reflux Disease (GERD), Nursing Care

223. **Answer:** 1.5 mL. Use the "Desire over Have" formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire } 15 \text{ mg}}{\text{Have } 10 \text{ mg}} = \frac{x \text{ mL}}{1 \text{ mL}}$$

$$10x = 15$$

$$x = \frac{15}{10}$$

$$x = 1.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

224. **Answer:** 1, 3, 4.

**1** Heavy lifting increases intraabdominal pressure, allowing gastric contents to move up through the lower esophageal sphincter (regurgitation), causing heartburn (pyrosis). **2** Lying down after eating promotes reflux and should be avoided. **3** Alcohol, in addition to peppermints, caffeine, and chocolate, decreases lower esophageal sphincter (LES) pressure, which permits gastric contents to move from the stomach into the esophagus. **4** Eating small, frequent meals limits the amount of food in the stomach, which limits gastroesophageal reflux. **5** Increasing fluids with meals increases gastric volume, causing distention and reflux. **6** Constrictive garments such as belts, binders, and girdles increase intraabdominal pressure and may lead to reflux.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Gastroesophageal Reflux Disease, Nursing Care

225. **3** Approximately two thirds of clients with peptic ulcer disease are found to have *Helicobacter pylori* infecting the mucosa and interfering with its protective function.

**1, 2, 4** Antibiotics do not cause this effect.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Data Base

226. Answer: 3, 5.

**1** Coffee and tea contain caffeine, which decreases esophageal sphincter pressure and should be avoided; milk does not have to be eliminated from the diet unless the client has lactose intolerance. **2** The head, not the foot, of the bed should be elevated to prevent nighttime reflux; at night infrequent swallowing and the recumbent position impair esophageal clearance. **3** Caffeine should be avoided because it decreases esophageal sphincter pressure, which permits reflux. **4** Three large meals increase the volume pressure in the stomach, which delays gastric emptying; four to six meals are preferred. **5** These actions promote digestion and prevent eructation (belching).

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Gastroesophageal Reflux Disease, Nursing Care

227. **4** Unless diluted by the increased blood flow, the highly concentrated solution can cause injury to the veins.

**1** The potential of infection is high with parenteral nutrition because of the increased glucose levels. **2, 3** This is not the primary reason, although the infusion at this site is more secure and promotes free use of the arms and hands.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Parenteral Replacement Therapy

228. **2** TPN solutions are high in glucose and are administered at room temperature, factors that increase the risk of microbial growth in the solution; they should be changed daily or sooner if they appear cloudy.

**1** Monitoring the blood glucose level q2h is too frequent; the client's blood glucose level should be monitored q4h to q6h to identify the presence of hyperglycemia, a metabolic complication of TPN. **3** The client should not breathe while the TPN catheter is changed because it may result in an air embolus; the Valsalva maneuver should be performed by the client for the few seconds it takes to switch the tubing. **4** An excess amount of glucose will be infused if the rate of the TPN is increased, and the endogenous insulin will be inadequate to meet this demand, resulting in hyperglycemia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Parenteral Replacement Therapy

229. **3** The act of eating allows the hydrochloric acid in the stomach to work on and be

neutralized by food rather than irritate the intestinal mucosa.

1 This symptom is not specific to duodenal ulcers. 2 This may indicate renal colic. 4 This is not specific to duodenal ulcers.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Peptic Ulcer Disease, Data Base

230. **Answer:** 200 mL/hr. The rate on an infusion control device (ICD) is specified in mL/hr. Fifteen minutes is  $\frac{1}{4}$  of an hour; the equivalent hourly rate is 4 times the volume. The nurse also programs the number of milliliters in the infusion as the volume to be infused (VTBI). The “Desire over Have” formula can be used to solve this problem.

$$\frac{\text{Desire } 60 \text{ minutes}}{\text{Have } 15 \text{ minutes}} = \frac{x \text{ mL}}{50 \text{ mL}}$$

$$15 x = 60 \times 50$$

$$15 x = 3000$$

$$x = 3000 \div 15$$

$$x = 200 \text{ mL/hr}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

231. 4 The vagus nerve stimulates the stomach to secrete hydrochloric acid. When it is severed, this neural pathway is interrupted and stomach secretions are decreased.

1 The portion of the vagus nerve that is severed innervates the stomach, not the heart; therefore, the heart rate is not affected. 2 The vagus nerve controls hydrochloric acid secretion, not gastric emptying; emptying is determined by the nature of foods being digested. 3 The vagus nerve is not a sensory nerve.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Data Base

232. 4 When high-osmotic fluid passes rapidly into the small intestine, it causes

hypovolemia. This results in a sympathetic response with tachycardia, diaphoresis, and dizziness. The symptoms also are attributed to a sudden increase and subsequent decrease in blood glucose level.

**1** The stomach is not full; its contents rapidly empty into the jejunum. **2** This may occur with gastroesophageal reflux disease; dumping syndrome is associated with increased motility involving the stomach and the jejunum. **3** This usually is associated with paralytic ileus; dumping syndrome leads to increased intestinal motility.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

**233. 2** This is an expected response during the first 24 hours after a gastric resection because of oozing of blood and blood coagulation.

**1** These are normal characteristics of gastric contents, which are unexpected after gastric surgery. **3** This indicates hemorrhage, which is unexpected. **4** Coffee ground material results from blood that has been digested by the gastric acid; gastric bleeding with a nasogastric tube in place will be red because gastric acids will not have time to act on the blood.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

**234. 3** Nasogastric drainage is expected to be bright red during the first 12 hours after surgery; bleeding lessens gradually during the 12 hours after surgery in response to hemostasis in the surgical area.

**1** This is unnecessary; bloody drainage is expected this soon after surgery. **2** Nasogastric suction must be working, and the tube must remain patent to prevent stress on the suture line. **4** The nasogastric tube is only irrigated if the health care provider orders it because of the danger of injury to the suture line; generally saline at room temperature is ordered.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

**235. 1** Patency of the tube should be maintained to ensure continued suction. Use of normal saline minimizes fluid and electrolyte disturbances during irrigation.

**2** The stomach is not considered a sterile body cavity, so medical asepsis is indicated. **3** Care must be taken to avoid traumatizing the mucosa. **4** Ice chips and water represent fluid intake, which must be approved by the health care provider; being hypotonic in nature, such intake may lower the level of serum electrolytes.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

**236. 1** Physiologic normal saline is used in gastric instillations to prevent electrolyte imbalance. Because of the fresh gastric sutures, slow and gentle instillation of saline should be performed to reestablish patency of the tube, and then the tube should be reconnected to suction to ensure stomach decompression.

**2, 4** The purpose of the instillation is to maintain the patency of the tube for gastric

decompression; with disconnection from suction, a buildup of secretions and air can occur, or the tube can become blocked by viscous drainage. **3** Increasing the pressure may cause damage to the suture line.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

237. **4** Fluid and electrolytes are lost through intestinal decompression; on a daily basis about 20% of the total body water is secreted into and almost completely reabsorbed by the GI tract.

**1** Because the client is kept NPO, there is no stimulus to cause enzymes to be secreted into the GI tract. **2** IV dextrose supplies some carbohydrates as a source of energy; carbohydrates will not be drawn from storage by intestinal decompression. **3** Because the client is being kept NPO, vitamins and minerals are not entering the GI tract and therefore are not lost.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Intestinal Obstruction, Nursing Care

238. **3** Dehydration is a danger because of fluid loss with GI suction.

**1, 2, 4** Based on the data provided, this clinical finding is not likely to occur.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 8, Intestinal Obstruction, Nursing Care

239. **1** Symptoms of dumping syndrome occur to some degree in about 50% of all individuals who have undergone a gastrectomy. They include weakness, faintness, heart palpitations, and diaphoresis. It is therefore important to explain to the client that such symptoms can be minimized by reclining after meals, eating small meals, and omitting concentrated and highly refined carbohydrates.

**2** Modification of roughage is part of the management of intestinal rather than gastric disorders. **3** Gas-forming foods affect the intestines, not the stomach. **4** Eating habits must be modified to prevent rapid emptying of the stomach.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

240. **3** Pernicious anemia is caused by a lack of vitamin B<sub>12</sub>. Intrinsic factor, produced by the parietal cells of the gastric mucosa, is necessary for B<sub>12</sub> absorption.

**1** B<sub>12</sub> is absorbed in the ileum. **2** The hemopoietic factor is the combination of B<sub>12</sub> and intrinsic factor. The intrinsic factor is secreted by the stomach, and food is the source of vitamin B<sub>12</sub>. **4** Chief cells secrete the enzymes of the gastric juice.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 8, Peptic Ulcer disease, Data Base

241. **2** To promote drainage of different lung regions, clients should turn every 2 hours. Deep breathing inflates the alveoli and promotes fluid drainage.

**1** During physical effort individuals with abdominal incisions often revert to shallow breathing. **3** Oxygen administration is a dependent function and is not generally required unless there is underlying cardiac or respiratory disease. **4** The airway is

expelled when the gag reflex returns.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

242. **3** Small, frequent feedings are tolerated best after a subtotal gastrectomy.

**1** Roughage may be irritating to the GI tract after surgery. **2** As soon as edema subsides, the individual generally is given small amounts of fluid and then the diet is progressed gradually. **4** Recuperation from gastric surgery may take up to 3 months; allowing only food preferences does not ensure inclusion of nutrients necessary for recovery.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

243. Answer: 1, 4, 5.

**1** Calcium deficiency is a late complication of bariatric surgery because of inadequate absorption, even with an intake of calcium-rich foods; calcium supplementation may be necessary. **2** Three small feedings daily will not provide adequate calories and nutrients; six small feedings with a total of 600 to 800 calories a day is routine once the client is eating. **3** Clients need to increase, not limit, fluid intake; the dumping syndrome contributes to diarrhea, which can cause dehydration and electrolyte imbalance. **4** Foods high in protein exit the stomach more slowly than foods high in carbohydrates, which minimizes the dumping syndrome. **5** Vitamin B<sub>12</sub> deficiency is a late complication of bariatric surgery because of a lack of intrinsic factor; gastric secretion is necessary for the absorption of vitamin B<sub>12</sub>. Lifelong supplementation may be necessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Obesity, Nursing Care

244. **3** When ingested food rapidly enters the jejunum without having gone through the usual mixing and digestive process, the hypertonic bolus causes rapid movement of extracellular fluid into the bowel; this rapid shift decreases the circulating blood volume. Decreased peripheral vascular resistance, visceral pooling of blood and reactive hypoglycemia are also implicated. Also, the distended jejunum increases intestinal peristalsis and motility.

**1** Backward flow of gastric contents into the esophagus causes heartburn, dysphagia, water brash, acid regurgitation, or belching (eructation). **2** Reflux gastritis is a chronic inflammation of the lining of the stomach caused by reflux of duodenal contents; epigastric pain, nausea, vomiting, and hematemesis are common clinical manifestations. **4** Abdominal peritonitis is an inflammation of the peritoneal membrane; rigidity of abdominal muscles, abdominal pain, low-grade fever, malaise, absent bowel sounds, and shallow respirations are common clinical manifestations.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Obesity, Nursing Care

245. **2** Clients need to be prepared emotionally for the body image changes that occur after bariatric surgery. Clients generally experience excessive abdominal skin folds after

weight stabilizes, which may require a panniculectomy. Body image disturbance often occurs in response to incorrectly estimating one's size; it is not uncommon for the client to still feel fat no matter how much weight is lost.

**1** The client needs to increase protein intake and avoid foods high in sugar and fat; alcohol and sweetened fluids should be avoided. **3** Barring complications, clients are ambulated and transferred to a chair within 8 hours of surgery. **4** Six small feedings for a total calorie intake of 600 to 800 calories in 24 hours plus fluids to prevent dehydration are routine once the health care provider orders a regular diet.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Obesity, Nursing Care

246. **1** This allows for easier digestion and absorption of medication in the stomach.

**2** This client should lie on the left side for 20 to 30 minutes to delay gastric emptying. **3** This client should be ingesting a high-protein diet with limited carbohydrates and no simple sugars; this will help minimize the dumping syndrome. **4** Barring any complications, this client should be discharged in 5 days and will not need patient-controlled analgesia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Obesity, Nursing Care

247. **2** ERCP involves the insertion of a cannula into the pancreatic and common bile ducts during an endoscopy. The test is not performed if the client's bilirubin level is more than 3 to 5 mg/dL because cannulation may cause edema, which will increase obstruction of bile flow.

**1, 3, 4** This is not directly related to this test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

248. Answer: 4, 3, 1, 2, 5.

**4** Getting out of bed is the activity that should be implemented first. It allows the client to adjust to the upright position before ambulating. **3** Light exercise such as walking can begin after tolerating sitting in a chair. **1** A client may shower or bathe 1 to 2 days after surgery. **2** A client may drive 3 to 4 days after surgery. **5** Objects exceeding 10 lb may be lifted 1 week after surgery.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Nursing Care

249. **2** When bile does not mix with foods in the intestine, emulsification of fats cannot occur and fat digestion is impaired. Stomach motility is also reduced, because increased stomach peristalsis depends on fat digestion in the small intestine.

**1** Once emulsified by bile, fatty foods are readily broken down by digestive enzymes. **3** The production of bile is unaffected. **4** Obstruction, not inadequate closure, of the ampulla of Vater causes discomfort. Bile and pancreatic secretions enter the duodenum through the ampulla of Vater. With obstruction, edema and spasms occur, blocking the flow of enzymes and causing pain.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

250. Answer: 1, 2, 5.

**1** Inadequate bile flow interferes with vitamin K absorption, contributing to ecchymosis, hematuria, and other bleeding. **2** Yellow sclera results from failure of bile to enter the intestines, with subsequent backup into the biliary system and diffusion into the blood. The bilirubin is carried to all body regions, including the skin and mucous membranes. **3** With obstructive jaundice the stool is clay-colored, not dark brown; the presence of bile causes stool to be brown. **4** When bile levels in the bloodstream are high, as in obstructive jaundice, there is bile in the urine, causing it to have a dark color. **5** Pain in the right upper quadrant occurs especially after eating foods high in fat and is characteristic of acute cholecystitis and biliary colic.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

251. Answer: 1, 2, 4.

**1** When bile levels in the bloodstream are high, as in obstructive jaundice, there is bile in the urine, causing it to have a dark color. **2** Jaundice (bile pigments causing yellow skin, sclera, and mucous membranes) results from failure of bile to enter the intestines, with subsequent backup into the biliary system and diffusion into the blood; the bilirubin is carried to all body regions. **3** Pain is experienced in the right upper quadrant, not on urination, because of spasm of the gallbladder, whether or not there is biliary obstruction. **4** The stools are clay-colored, not brown, because the bile pigments are not present in the GI tract as a result of the obstruction of the common bile duct. **5** Coffee-ground vomitus indicates gastric bleeding; it is not a unique sign of cholelithiasis with obstructive jaundice.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

252. **2** Vitamin K is necessary in the formation of prothrombin to prevent bleeding. It is a fat-soluble vitamin and is not absorbed from the GI tract in the absence of bile.

**1** Bilirubin is the bile pigment formed by the breakdown of erythrocytes. **3** Thromboplastin converts prothrombin to thrombin during the process of coagulation. **4** Cholecystikinin is the hormone that stimulates contraction of the gallbladder.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Nutrients, Vitamins

253. **2** The location of the incision results in pain on inspiration or coughing. The subsequent reluctance to cough and deep breathe facilitates respiratory complications from retained secretions.

**1** This surgery does not take a prolonged period of time. **3** Bile does not impair inflammatory or immune responses. **4** Cholelithiasis and cholecystitis generally are inflammatory, not infectious, processes.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Cholelithiasis/Cholecystitis, Nursing Care

254. 3 A pseudocyst of the pancreas is an abnormally dilated space that contains blood, necrotic tissue, and enzymes, and is surrounded by connective tissue.

1, 2, 4 This is an incorrect definition of a pseudocyst.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Acute Pancreatitis, Data Base

255. 4 Alcohol stimulates pancreatic enzyme secretion and an increase in pressure in the pancreatic duct. The backflow of enzymes into the pancreatic interstitial spaces results in partial digestion and inflammation of the pancreatic tissue.

1 Although blockage of the bile duct with calculi may precipitate pancreatitis, this is not associated with alcohol. 2 Alcohol does not deplete insulin stores; the demand for insulin is unrelated to pancreatitis. 3 Although the volume of secretions increases, the composition remains unchanged.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Acute Pancreatitis, Data Base

256. 1 Open communication helps to decrease anxiety.

2 Antibiotics will have no direct effect on the client's anxiety. 3 Knowledge does not always reduce anxiety and promote rest. 4 This response is false reassurance.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Pancreas, Nursing Care

257. Answer: 2, 3, 5.

1 The client would be kept NPO to decrease gastrointestinal activity and the secretion of pancreatic enzymes. 2 Analgesics, histamine-receptor antagonists, and anticholinergics may be administered to decrease gastrointestinal activity and the secretion of pancreatic enzymes. 3 Relaxation will decrease the metabolic rate, which will decrease gastrointestinal activity, including the secretion of pancreatic enzymes. 4 Walking increases the metabolic rate, which will increase gastrointestinal activity, including the secretion of pancreatic enzymes. 5 This is necessary to assess for hypokalemia and fluid volume changes. 6 Hypocalcemia, not hypercalcemia, occurs because of trapping of calcium in fecal fat and in necrotic tissue.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Acute Pancreatitis, Nursing Care

258. Answer: 1, 4, 6.

1 Soft foods limit irritation of esophageal varices if present. 2 A regular diet will not meet the dietary requirements of this client. 3 A low-protein diet will not provide enough protein to correct the severe malnutrition associated with alcoholism in the absence of an increased serum ammonia level; in hepatic coma protein intake is reduced to 15 to 30 g. 4 A high-protein intake is necessary to correct severe malnutrition in the absence

of an increased serum ammonia level. **5** A low-carbohydrate diet will not provide for energy needs. **6** A high-carbohydrate intake provides for energy needs.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Nursing Care

259. **1** Thiamine (vitamin B<sub>1</sub>) and niacin (vitamin B<sub>3</sub>) help convert glucose for energy and therefore influence nerve activity.

**2** These vitamins do not affect elimination. **3** These vitamins are not related to circulatory activity. **4** Vitamin K, not thiamine and niacin, is essential for the manufacture of prothrombin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Nutrients, Vitamins

260. **1** The liver detoxifies alcohol and is the organ most often damaged in chronic alcoholism. A high-calorie diet minimizes tissue breakdown and promotes healing.

**2, 3, 4** This organ is not involved in detoxification of alcohol.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Nursing Care

261. **4** The temperature during steaming is never high enough or sustained long enough to kill microorganisms.

**1** Processing destroys the virus. **2** Because of the extremely high temperature, broiling sufficiently destroys the virus. **3** Baking will destroy the virus.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatitis, Data Base

262. **4** Drugs are available to help reduce the viral load (antivirals), including lamivudine (Epivir-HBV), ribavirin (Rebetol), and adefovir dipivoxil (Hepsera).

**1** Although this is a true statement, sedatives are given only prn and do not treat the hepatitis. **2** This is used only during the incubation period. **3** Vitamins are used as adjunctive therapy and will not eliminate the hepatitis.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatitis, Data Base

263. Answer: 2, 5.

**1** Preventing constipation is not related to limiting the risk for contracting hepatitis

B. **2** Contracting hepatitis B through blood transfusions can be prevented by screening donors and testing the blood. **3** Avoiding shellfish in the diet limits the risk for contracting hepatitis A. **4** This does not prevent transmission of hepatitis B. **5** Hepatitis B can be transmitted via contaminated body fluids such as semen, saliva, and urine. Multiple sexual partners increase the risk. A monogamous sexual relationship with an infection-free individual eliminates the risk.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8,

264. **3** The virus is present in the stool of clients with hepatitis A; therefore, standard precautions should be followed when handling excretions. The virus may also be present in urine and nasotracheal secretions.

**1** The Centers for Disease Control and Prevention (CDC) indicate that only standard precautions are necessary when caring for a client who is positive for the presence of hepatitis A; if a client is incontinent or using an incontinence device, the CDC recommends contact precautions be implemented. **2** Bringing food to a client requires no precautions; however, disposable utensils should be used and utensils discarded following standard precautions because the client's nasotracheal secretions contain the virus. **4** Hepatitis A usually is not transmitted via the air.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 8, Hepatitis, Nursing Care

265. **3** Hepatitis C is caused by an RNA virus that is transmitted parenterally. More effective blood screening for hepatitis C was introduced in June 1992; this brought about a dramatic decrease in hepatitis C infection caused by blood transfusions; recent studies document that the risk of contracting hepatitis C from a blood transfusion is 1 in 103,000 transfusions. The incubation period is 5 to 10 weeks.

**1** Hepatitis A, also known as infectious hepatitis, is caused by an RNA virus that is transmitted via the fecal-oral route. The incubation period is 2 to 6 weeks. **2** Hepatitis B is transmitted parenterally, sexually, and by direct contact with infected body secretions. The incubation period is 1 to 6 months. It is not the major cause of posttransfusion hepatitis. **4** Hepatitis D is a complication of hepatitis B.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Knowledge; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 8, Hepatitis, Data Base

266. **3** The diet should be high in carbohydrates with moderate to high protein and low fat content.

**1, 4** This is too high in fat. **2** This is too low in carbohydrates.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Hepatitis, Data Base

267. **1** Hepatitis A microorganisms are transmitted via the anal-oral route; handwashing, particularly after toileting, is the most important precaution.

**2** This will not deter the spread of the virus; handwashing is necessary. **3, 4** Hepatitis A microorganisms exit through the rectum, not the respiratory tract.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Hepatitis, Nursing Care

268. **2** Hepatitis C is a bloodborne pathogen that can be transmitted via contaminated tattoo needles.

**1** Hepatitis A is not a bloodborne pathogen; it is spread through contaminated food or water. **3** Although hepatitis D is a bloodborne pathogen, it can be produced only when

the hepatitis B virus is present. Also, hepatitis D is not the main virus associated with contaminated tattoo needles. **4** Hepatitis E is believed to be transmitted via the fecal-oral route; it is spread through contaminated food or water.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatitis, Data Base

269. **3** Weight is helpful in determining the extent of ascites; 1 L of retained fluid equals approximately 2.2 lb.

**1** Diet history will not help in monitoring a client's condition. **2** Bowel sounds are objective data but do not help monitor the liver. **4** Pain is subjective.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Cancer of the Liver, Nursing Care

270. **3** With liver failure, the protein intake is limited to 20 g daily to decrease the possibility of hepatic encephalopathy.

**1** A high-fat diet is avoided because of the related cardiovascular risks and the related demand for bile. **2** Regeneration of tissue requires a high-calorie, high-carbohydrate diet. **4** Sodium usually is restricted to decrease the accumulation of fluid and help limit ascites and edema.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Nursing Care

271. **4** The increased pressure within the portal circulatory system causes increased pressure in areas of portal systemic collateral circulation (most important, in the distal esophagus and proximal stomach). Hemorrhage is a possible complication.

**1** Liver abscesses may occur as a complication of intestinal infections, not portal hypertension. **2** This may be caused by manipulation of the bowel during surgery, peritonitis, neurologic disorders, or organic obstruction, not portal hypertension. **3** Perforation of the duodenum usually is caused by peptic ulcers; it is not a direct result of portal hypertension or cirrhosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

272. **3** These activities should be avoided to prevent inaccurate test results.

**1** The recorder should be checked every 15 minutes. **2** Avoiding food and fluid during the test is unnecessary. **4** The capsule should be held under the tongue for 1 minute while the unit verifies that the light source is functioning.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Gastrointestinal Series

273. **4** This tube includes an esophageal balloon that exerts pressure on inflation, which retards hemorrhage.

**1** A Levin tube is used for gastric decompression, gavage, or lavage; it has one lumen. **2** A Salem sump tube is used for gastric decompression; it has two lumens, one for decompression and one for an air vent. **3** A Miller-Abbott tube is used for intestinal

decompression.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

274. **1** Because the liver is unable to detoxify ammonia to urea, protein intake should be further restricted when coma is inevitable.

**2, 3, 4** This relatively high intake of protein will increase blood ammonia levels.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

275. **Answer: 261 calories. Fat contains 9 kilocalories per gram; carbohydrates and proteins contain 4 kilocalories per gram; therefore,  $117 + 124 + 20 = 261$  kilocalories.**

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 8, Review of Nutrients, Sources of Energy

276. **Answer: 1, 4.**

**1** An accumulation of nitrogenous wastes affects the central nervous system, causing mental confusion. **2** Increased cholesterol levels are not necessarily present. **3** Stool is often clay-colored because of lack of bile caused by biliary obstruction. **4** An accumulation of nitrogenous wastes in hepatic coma affects the nervous system. Flapping tremors and generalized twitching occur in the second stage of this disease. **5** As encephalopathy progresses to coma, all reflexes are absent.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

277. **1** Bile deposits will impart a yellowish tinge (jaundice or icterus) to the skin, often first observed in the sclerae.

**2** Urticaria (or hives) generally is characteristic of an allergic response. **3** Uremic frost is characteristic of kidney failure. **4** Hemangioma is a benign lesion composed of blood vessels.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

278. **1** Increased ammonia levels indicate that the liver is unable to detoxify protein by-products. Neomycin reduces the amount of ammonia-forming bacteria in the intestines.

**2** Culture and sensitivity testing is unnecessary; cirrhosis is an inflammatory, not infectious, process. **3** Increased white blood cell count may indicate infection; however, this will have no relationship to the need for neomycin enemas. **4** Alanine aminotransferase (ALT), also called serum glutamic-pyruvic transaminase (SGPT), assesses for liver disease but has no relationship to the need for neomycin enemas.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

279. **4** One of the many functions of the liver is the manufacture of clotting factors; there is interference in this process with cirrhosis of the liver, resulting in bleeding tendencies.

**1** The storage of fat-soluble vitamins (A, D, E, and K), water-soluble vitamins (B<sub>1</sub>, B<sub>2</sub>, folic acid, and cobalamin), and minerals (including iron) is compromised in cirrhosis; therefore, these nutrients, including vitamin K, should not be limited. **2** Should the client bleed, the pulse rate may be increased, but it is not necessary for the client to

check the pulse rate several times daily. **3** A client whose prothrombin time is prolonged and platelet count is low should not be taking aspirin, even with milk.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hepatic Cirrhosis, Data Base

280. **2** The diet should be high in protein and calories, low in fat, and gluten-free for individuals with malabsorption syndrome. Protein is needed for tissue rebuilding.

**1** The client may prefer foods high in gluten, which will potentiate malabsorption. **3** IV therapy is a dependent function and does not provide all the necessary nutrients. **4** Diarrhea is caused by malabsorption, which accounts for the depressed nutritional status; once the diarrhea is corrected, it is essential to compensate by providing a nutritious diet.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

281. **4** Gluten, a cereal protein, appears to be responsible for morphologic changes of the intestinal mucosa with nontropical sprue (adult celiac disease).

**1** Folic acid, along with antimicrobial agents, is used to treat tropical, not celiac, sprue; it causes dramatic improvement in tropical sprue. **2** Vitamin B<sub>12</sub> may be administered if macrocytic anemia or achlorhydria develops; however, it does not correct the major pathology. **3** The use of corticosteroids may be advantageous with either form of sprue; however, this does not produce the dramatic effect achieved by a gluten-free diet.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

282. Answer: 3, 4.

**1** Gluten is not found in corn. **2** Gluten is not found in milk and dairy products. **3** Gluten is found in rye, oats, wheat, and barley, which should be avoided because gluten in these grains is irritating to the GI mucosa. **4** Gluten is found in rye bread and should be avoided. **5** Gluten is not found in fruit.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

283. **3** Undigested fat in the feces (steatorrhea) is associated with diseases of the intestinal mucosa (e.g., celiac sprue) or pancreatic enzyme deficiency.

**1** Darkening of feces by blood pigments (melena) is related to upper GI bleeding. **2** Bright red blood in the stool is related to lower GI bleeding (e.g., hemorrhoids). **4** Stools containing blood and mucus (currant jelly stools) are associated with intussusception.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

284. **4** Neither of these foods contains gluten, and they are permitted in a diet for a client with malabsorption syndrome.

**1** The breading on the veal cutlet contains gluten and cannot be eaten by this client. **2** The bread for the sandwich contains gluten. **3** Noodles and crackers contain

gluten.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

285. Answer: 1, 2.

**1** Green beans are a vegetable; fresh fruits and vegetables are permitted on a gluten-free diet. **2** A baked potato is permitted on a gluten-free diet. **3** Noodles are made of flour high in gluten and should be avoided. **4** Bread is made with flour high in gluten and should be avoided. **5** Whole wheat cereal is high in gluten and should be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Malabsorption Syndrome, Data Base

286. **3** Rebound tenderness is a classic subjective sign of appendicitis.

**1** Urinary retention does not cause acute lower right quadrant pain. **2** Hyperacidity causes epigastric, not lower right quadrant pain. **4** There generally is decreased bowel motility distal to an inflamed appendix.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Appendicitis, Data Base

287. Answer: 1, 5.

**1** A moderate fever is associated with inflammation of the peritoneal membrane. **2** Malaise, rather than hyperactivity, is often associated with peritonitis. **3** Nausea, not hunger, is a common occurrence with peritonitis. **4** Urinary retention may occur following surgery as a complication of anesthesia, not peritonitis. **5** Muscular rigidity over the affected area is a classic sign of peritonitis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Peritonitis, Data Base

288. **2** The semi-Fowler position aids in localizing drainage to the lower abdominal cavity and prevents the spread of infection throughout the abdominal cavity.

**1, 4** This position will not allow for localization of drainage. **3** The Trendelenburg position will contribute to the spread of infection throughout the abdominal cavity.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Peritonitis, Data Base

289. McBurney's point is located in the right lower quadrant of the abdomen over the appendix. This point is one third of the distance from the anterior iliac spine to the umbilicus; rebound tenderness in this area may indicate appendicitis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Appendicitis, Nursing Care

290. **2** A rectal catheter should be inserted approximately 4 inches to pass the rectal sphincters.

**1** A catheter inserted just 2 inches will not pass beyond the rectal sphincters. **3, 4** This may damage the intestinal mucosa.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Enemas

291. Answer: 1, 2, 4.

**1** Absorption through the GI tract is impaired and parenteral administration goes directly into the intravascular compartment. **2** Disease of the GI tract hampers absorption. **3** IV vitamins do not decrease colonic irritability. **4** Because the mucosa of the intestinal tract is damaged, its ability to absorb vitamins taken orally is greatly impaired. **5** Route of administration does not affect allergic response.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Inflammatory Bowel Disease, Regional Enteritis (Crohn Disease), Data Base

292. **2** When the diseased bowel is removed, the client's symptoms cease.

**1** Surgical removal of a body part is not temporary, but permanent. **3** Ulcerative colitis does not progress to Crohn disease; clients with ulcerative colitis have an increased risk for colorectal cancer. **4** This is not a true statement.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Data Base

293. **1** The caffeine in cola is chemically irritating to the intestinal mucosa. Caffeine also promotes secretion of gastric juice.

**2** Amino acids are absorbed slowly and are not irritating. **3** Rice products do not irritate the bowel and need not be restricted. **4** This is too general; except for those that contain lactose sugars, products containing sugar generally are not irritating to the mucosa.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Irritable Bowel Syndrome, Nursing Care

294. Answer: 2, 5.

1 Fever may or may not be a sign. 2 The inflammatory process tends to increase peristalsis, causing diarrhea. As ulceration occurs, loss of blood leads to anemia. 3 The client will lose weight because of anorexia and malabsorption. 4 Hemoptysis (coughing up blood from the respiratory tract) is not a related sign. 5 The inflammatory process tends to increase peristalsis, causing spasms of the intestines.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Data Base

295. 2 Occult blood in the stool may indicate active bleeding.

1 This situation does not warrant examining the stool for fat. 3 There is no indication that parasites are present; the situation does not warrant examining the stool for an infestation. 4 This situation does not warrant culturing the stool for bacteria.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Data Base

296. Answer: 2, 4, 5, 1, 3.

2 A garden salad has 95 calories. 4 One slice of French toast has 126 calories. 5 Six chicken tenders have 236 calories. 1 An order of French fries has 372 calories. 3 A Whopper with cheese has 720 calories.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Review of Nutrients, Sources of Energy

297. 3 Weight loss usually is severe with Crohn disease; therefore, weight gain is a priority. This goal is specific, realistic, measurable, and has a time frame.

1, 2, 4 Although this is important, it is not as high a priority as weight gain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Inflammatory Bowel Disease, Regional Enteritis (Crohn Disease), Nursing Care

298. Answer: 2, 3, 5.

1 Rice is not irritating to the GI tract and does not have to be avoided. 2 Milk contains lactose, which is irritating to the GI tract. 3 Cheese is a milk product that is irritating to the GI tract. 4 Table salt does not irritate the intestinal mucosa and does not need to be avoided. 5 Chocolate candy contains caffeine, which is chemically irritating to the intestinal mucosa and should be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

299. 1 The inflammatory process associated with colitis increases peristalsis, causing abdominal cramping, diarrhea, and weight loss.

**2** Coughing up blood from the respiratory tract (hemoptysis) is not associated with colitis. **3** Anemia, not polycythemia, is associated with colitis. **4** The WBC count may be increased, not decreased.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

300. **2** This is low residue and is less irritating to the colon than the other foods.

**1** Orange juice contains cellulose, which is not absorbed and irritates the colon. **3, 4** Milk contains lactose, which is irritating to the colon.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

301. **3** Intussusception is the telescoping or prolapse of a segment of the bowel into the lumen of an immediately connecting segment of the bowel.

**1** Volvulus is a twisting of the bowel onto itself. **2** Adhesions are bands of scar tissue that can compress the bowel. **4** Herniation describes protrusion of an organ through the wall that contains it.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Intestinal Obstruction, Data Base

302. **4** Emotional stress of any kind can stimulate peristalsis and thereby increase the volume of drainage.

**1** The client should be encouraged to eat a regular diet if possible. **2** Ileostomy drainage is liquefied and continuous, so irrigations are not indicated. **3** The stoma will start to drain within the first 24 hours after surgery.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

303. **2** Vitamin B<sub>12</sub> (extrinsic factor) combines with intrinsic factor, a substance secreted by the parietal cells of the gastric mucosa, forming hemopoietic factor. Hemopoietic factor is absorbed in the ileum, from which it travels to bone marrow and stimulates erythropoiesis.

**1** Folic acid is not absorbed in the ileum. **3** Iron absorption does not occur in the ileum. **4** Trace elements of these substances are not absorbed in the ileum.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Review of Anatomy and Physiology, Structures of the Gastrointestinal System Small Intestine

304. Answer: 1, 3.

**1** Trauma to the abdominal wall and to the stoma should be avoided; contact sports, such as football, are contraindicated. **2** Trauma to the abdominal wall is a minimal risk when swimming. **3** Trauma to the abdominal wall and to the stoma should be avoided; contact sports, such as ice hockey, are contraindicated. **4** Track events are not associated with trauma to the abdominal wall. **5** Cross-country skiing is not associated

with trauma to the abdominal wall.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

[Ch 8](#), Cancer of the Small Intestine, Colon, or Rectum, Nursing Care

305. **1** To take advantage of the anatomic position of the sigmoid colon and the effect of gravity, the client should be placed in the left Sims or left side-lying position for the enema.

**2, 3, 4** This position does not facilitate the flow of fluid into the sigmoid colon by gravity.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** [Ch 8](#), Related Procedures, Enemas

306. **2** Emptying the appliance when half full will help prevent the weight of the fecal drainage from pulling the appliance away from the seal, thus preventing leakage.

**1** A colostomy of the ascending colon usually is not irrigated because the feces will be semi liquid. **3** The peristomal skin is cleaned with soap and water; an antiseptic is too caustic. **4** The pouch opening should be approximately 1/8 inch larger than the stoma. This limits exposure of peristomal skin to irritation from feces.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Implementation; **Reference:** [Ch 8](#),

Cancer of the Small Intestine, Colon, or Rectum, Data Base

307. **2** The client must be ready to accept changes in body image and function; this acceptance will facilitate mastery of the techniques of colostomy care and optimal use of community resources.

**1, 3, 4** Specific knowledge can be imparted only when an individual is ready to learn; it requires acceptance of a new body image.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 8](#), Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

308. **2** Neomycin provides preoperative intestinal antisepsis.

**1** The desired effect of this drug is unrelated to kidney function; nephrotoxicity is a side effect. **3** It will not prevent metastasis. **4** This is not the purpose of administering this medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 8](#), Cancer of the Small Intestine, Colon, or Rectum, Data Base

309. **3** A brick red stoma indicates adequate vascular perfusion.

**1, 2, 4** This indicates inadequate perfusion of the stoma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** [Ch 8](#), Inflammatory Bowel Disease, Ulcerative Colitis, Nursing Care

310. **3** When GI absorption is inadequate, total parenteral nutrition (TPN) is the nutritional therapy of choice because it provides needed nutrients.

**1** TPN usually is used with chronic or long-term therapy, not for short-term therapy. **2** TPN is used for total, not supplemental, nutrition. **4** This is not the

indication for TPN; a feeding tube would be used in this instance.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning, **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 8, Related Procedures, Parenteral Replacement Therapy

311. **1** Because emotional stress can influence the progress of Crohn disease, initially the nurse should help the client to explore self-attitudes to aid in better understanding the feelings engendered by her boyfriend dating others.

**2** Initially the nurse should help the client explore the situation and the feelings it engenders rather than involve the boyfriend. **3** The client should make the decision about seeing her boyfriend. **4** This is premature; the client is not ready for a joint counseling session.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Inflammatory

Bowel Disease, Regional Enteritis (Crohn Disease), Nursing Care

312. **4** In ulcerative colitis, pathology usually is in the descending colon; in Crohn disease, it is primarily in the terminal ileum, cecum, and ascending colon.

**1** Ulcerative colitis, as the name implies, affects the colon, not the small intestine. **2** There is no direct correlation of colitis with malignancy of the bowel, although psychologic, environmental, genetic, and nutritional factors, as well as preexisting disease, appear to be influential in malignancy. **3** Involvement is in the distal portion of the colon, not the proximal portion.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative

Colitis, Data Base

313. **3** If medical management fails, this is the next logical choice because it removes the affected intestine.

**1** Psychotherapy might improve the client's ability to cope with the disease, but it will not solve the physical problems. **2, 4** This is a classic intervention that probably had been tried during prior exacerbations and it has failed.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 8, Inflammatory Bowel Disease, Ulcerative

Colitis, Data Base

314. **2** This takes advantage of the gastrocolic reflex that occurs after eating; also, it is important to establish a schedule that is at the same time every day; before leaving the house for the day is the most appropriate time for a person who has a job outside the home.

**1, 3** This may not take advantage of the gastrocolic reflex that occurs after eating. **4** New bowel habits have to be established; irrigations take time to accomplish and need to be scheduled before or after the day's work activities begin.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 8, Related Procedures, Colostomy Irrigation

315. **3** The stoma of a colostomy must be dilated with a lubricated, gloved finger to

prevent strictures and subsequent obstruction.

**1** Once healing has occurred, activity is not limited. **2** Clothing need not be special, but should be nonconstricting. **4** Diet should be as close to normal for the individual as possible; gas-forming foods should be avoided.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Small Intestine, Colon, or Rectum, Nursing Care

316. **3** Although foods that produce gas are generally avoided, the diet should be as close to normal as possible for optimal physiologic and psychologic adaptation.

**1** A high-protein diet is important until healing occurs; but a balanced diet generally meets nutritional needs for protein. **2** There is no need to limit fiber; it provides bulk necessary for soft, formed stools. **4** Absorption of nutrients is unaffected; there is no need to increase the caloric intake.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Cancer of the Small Intestine, Colon, or Rectum, Nursing Care

317. **2** Isotonic saline most closely resembles body fluids; it will not cause an imbalance by pulling fluids and electrolytes out of the intravascular compartment.

**1, 3** Hypotonic solutions will allow absorption of fluid into the intravascular compartment, resulting in dilution of electrolytes and possible circulatory overload. **4** Hypertonic solutions will draw fluids out of the intravascular compartment into the GI tract; glucose provides a medium for bacterial growth.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Intestinal Obstruction, Nursing Care

318. **1** Surgery on the bowel has no direct anatomic or physiologic effect on sexual performance. However, psychologic factors may hamper this function, and the nurse should encourage verbalization.

**2** Although it may take several months to resume satisfying sexual relationships, the surgery has no direct physiologic effect. **3** There is no reason why sexual activity must be curtailed. **4** Although a partner should understand the nature of the surgery, the focus at this time should be on the client.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Small Intestine, Colon, or Rectum, Nursing Care

319. **4** A transverse colostomy is an opening created in the transverse colon. The rectal tube should be pointed to the proximal intestine, which contains the feces.

**1** A water-soluble lubricant should be used to facilitate insertion. **2** There are no sphincters, so bearing down is unnecessary. **3** Continual pressure may traumatize the mucosa; lack of nerve endings diminishes sensation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Colostomy Irrigation

320. **3** An enema or ostomy irrigation can cause cramping. Cramping generally will

subside if the tubing is clamped for a few minutes; the procedure can be continued when the cramping subsides.

**1** Discontinuing the irrigation may lead to ineffective evacuation of the colon. **2** Lowering the container will decrease the rate of flow, but fluid will continue to enter the colon if the container remains above the stoma. **4** This can injure the mucosa and does not affect cramping.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Colostomy Irrigation

321. **2** Three inches is far enough to direct the flow of solution into the bowel.

**1** Two inches is inadequate; fluid may leak back around the catheter. **3, 4** This may cause trauma to the mucosa.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Colostomy Irrigation

322. **3** A colostomy irrigation is much like a tap-water enema. The solution must be held high enough to allow it to flow into the bowel but not so high that it flows rapidly, or it causes cramping or mucosal injury.

**1, 2** This does not represent the maximum height permitted and may not ensure flow of solution into the bowel. **4** This is too high and may cause intestinal trauma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Procedures, Colostomy Irrigation

323. **4** If the area is not kept both clean and dry, drainage from the colostomy can quickly cause a breakdown of the skin around the stoma. This, in combination with a warm, moist surface, predisposes the individual to infection.

**1, 2** Although oral fluids are withheld until peristalsis returns, it is essential that parenteral fluids be administered to replace the losses incurred by surgery. **3** The client is often unable to accept the altered body image and must be given time to adjust before participating actively in self-care.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Small Intestine, Colon, and Rectum, Nursing Care

324. **1** There are few physical restraints on activity postoperatively, but the client may have emotional problems resulting from the body image changes.

**2** Independence should be encouraged; however, some activities may require up to 3 months before resumption. **3** Swimming is not prohibited because water does not harm the stoma. **4** Changes in activities are not necessary.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Cancer of the Small Intestine, Colon, or Rectum, Nursing Care

325. **3** A client with a fecal impaction has the urge to defecate but is unable to do so.

**1** Flatulence may occur as a result of immobility, not just obstruction. **2** Anorexia may occur with an impaction but also may be caused by other conditions. **4** The frequency of bowel movements varies for individuals; it may be normal for this individual not to

have a bowel movement for several days.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Intestinal Obstruction, Data Base

326. Answer: 1, 2, 3.

**1** Peristalsis increases in an attempt to evacuate the hardened feces; spasms of the intestine may occur. **2** When the bowel is impacted with hardened feces, there often is seepage of liquid feces around the obstruction and thus uncontrolled diarrhea. **3** Intestinal gas builds up behind the obstruction; peristaltic waves initiate movement of intestinal contents that cause gurgling sounds in the intestine (borborygmi). **4** This is indicative of lower GI bleeding. **5** There are often frequent liquid bowel movements in the presence of an impaction.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Intestinal Obstruction, Data Base

327. **4** Prune juice and warm water can be administered prophylactically by the nurse to promote defecation. Prune juice irritates the bowel mucosa, stimulating peristalsis. Fiber in the diet increases fecal volume, which stimulates intestinal motility and the reflex for defecation.

**1** Enemas should be avoided because they can promote dependency and can result in electrolyte imbalance. **2** The routine use of laxatives promotes dependency. **3** The client is bedbound and is unable to use a commode.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Intestinal Obstruction, Nursing Care

328. **4** Fiber absorbs water, swells, and consequently stretches the bowel wall, promoting peristalsis, mass movements, and defecation. Smooth muscle tends to contract when stretched because of the reflex activity of stretch receptors.

**1** Bulk caused by fiber does not irritate the bowel wall. **2** There is no chemical stimulation. **3** Bacterial action is not involved in the process by which bulk stimulates defecation.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Review of Diets

329. **4** A low-residue diet limits stool formation.

**1** Bland diets usually are employed in the management of upper, not lower, GI disturbances. **2** Although a clear diet is low in residue, it does not meet nutritional needs. **3** A high-protein diet is indicated postoperatively to promote healing.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hemorrhoids, Data Base

330. Answer: 1, 5.

**1** Straining at stool increases intraabdominal, systemic, and portal venous pressures that promote the development of hemorrhoids. **2** Hypertension does not contribute to the development of hemorrhoids. **3** Spicy foods may irritate hemorrhoids but do not cause them. **4** Bowel incontinence is unrelated to the development of hemorrhoids. **5** The enlarging uterus puts pressure on the inferior vena cava that leads to increased portal

venous pressure, causing anorectal varicosities.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Hemorrhoids, Data Base

331. Answer: 2, 3, 4, 5.

**1** Flatulence is unrelated to hemorrhoids. **2** Pruritus occurs as varicosities enlarge and become inflamed. **3** Blood and mucus in the stool occur as varicosities enlarge and become inflamed. **4** Rectal pressure occurs as portal venous pressure increases and varicosities enlarge. **5** Pain occurs when varicosities enlarge and thromboses occur; pain increases on defecation.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Hemorrhoids, Nursing Care

332. Answer: 2, 3.

**1** Enemas may be ordered several days after surgery if the client has not had a bowel movement. **2** Moist heat dilates the blood vessels, thereby increasing circulation to the area; this is soothing and promotes healing. **3** Stool softeners are prescribed to avoid straining on defecation and constipation. **4** Baths, especially sitz baths, are advised to promote healing and cleaning of the area. **5** Occlusive dressings are not used. Light applications of witch hazel may be used to promote drainage and healing.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Hemorrhoids, Nursing Care

333. **1** Any situation in which a needle is inserted under the skin is a potential source of hepatitis; according to the CDC, the range for the incubation period is 45 to 180 days; however, the average incubation period is 60 to 90 days.

**2** The range for the incubation period is 45 to 180 days. **3** Hepatitis B is not transmitted via inadequate sanitation or a contaminated water supply. **4** Hepatitis B is not transmitted by casual proximity to others.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Hepatitis, Data Base

334. **1** The client is exhibiting classic symptoms of hyperglycemia, and simple serum glucose monitoring evaluated by a glucose monitoring machine will help guide the nurse's next action.

**2** This is a useless assessment; urinary output must be evaluated in relation to intake. **3** Assessing the blood pressure may be a secondary action to assess for overhydration; if headache alone were present, rather than the classic signs of hyperglycemia, taking the blood pressure might be the initial action. **4** This is unnecessary; the symptoms do not indicate infection.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 8, Related Procedures, Parenteral Replacement Therapy

335. **2** This is the only vegetable listed that is included in a low-residue diet; this vegetable is low in fiber.

**1, 3, 4** This vegetable contains more fiber than creamed potatoes.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Review of Diets

336. **3** This drug inhibits peristalsis and prolongs transit time by its effect on the nerves in the muscle wall of the intestines.

**1** This drug is a laxative, not an antidiarrheal; it increases GI motility. **2** This is not an antidiarrheal; it is a bulk laxative that promotes easier expulsion of feces. **4** This drug corrects constipation, not diarrhea; water and fat are increased in the intestine, permitting easier expulsion of feces.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Pharmacology, Antidiarrheals

# Endocrine System

337. Answer: 1, 3, 6.

**1** As excessive fluid is lost through urination, dehydration triggers the thirst response. **2** Diabetes insipidus is not a disorder of glucose metabolism; blood glucose levels are not affected. Diabetes mellitus affects glucose metabolism. **3** As excessive fluid is lost through urination, dehydration occurs, resulting in dry mucous membranes and poor skin turgor. **4** Loss of fluid may decrease the blood pressure because fluid is lost from the intravascular compartment. **5** As fluid is lost from the intravascular compartment, serum osmolarity increases, not decreases. **6** Because water is not being reabsorbed, urine is dilute, resulting in a low specific gravity (less than 1.005).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Insipidus, Data Base

338. **3** Deficient antidiuretic hormone (ADH) from the posterior pituitary results in diabetes insipidus. This can be caused by head trauma; water is not conserved by the body and excess amounts of urine are produced.

**1** Although increased serum glucose may cause polyuria, it is associated with diabetes mellitus, not diabetes insipidus. **2** Ineffective renal perfusion will cause decreased urine production. **4** While excess amounts of IV fluids may cause dilute urine, it is unlikely that a client with head trauma will be receiving excess fluid because of the danger of increased intracranial pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 8, Related Anatomy and Physiology, Structures of the Endocrine System

339. **4** Reabsorption of sodium and water in the kidney tubules decreases urinary output and retains body fluids.

**1, 2** The opposite is true. **3** There is no effect on filtration with ADH; ADH increases reabsorption in the tubules.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Review of Anatomy and Physiology, Pituitary Gland

340. Answer: 2, 4.

**1** Oliguria, not polyuria, occurs as antidiuretic hormone (ADH) acts on nephrons to cause water to be reabsorbed from the glomerular filtrate. **2** Excessive levels of ADH cause inappropriate free water retention; for every liter of fluid retained, the client will gain approximately 2.2 lb. **3** Because of water reabsorption, blood volume may increase, causing hypertension, not hypotension. **4** Free water retention results in a hyposmolar state with dilutional hyponatremia. **5** This increases, not decreases, as a result of increased urine concentration.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Syndrome of Inappropriate Antidiuretic Hormone Secretion, Data Base

341. **2** The hypophysis (pituitary gland) does not directly regulate insulin release. This is controlled by serum glucose levels. Because somatotropin release will stop after the hypophysectomy, any elevation of blood glucose level caused by somatotropin will also stop.

**1** This effect may be expected after a hypophysectomy because follicle-stimulating hormone and its releasing factor will no longer be present to stimulate spermatogenesis. **3** When adrenocorticotrophic hormone (ACTH) is absent, cortisone will have to be administered. **4** Thyroid-stimulating hormone will not be present; extrinsic thyroxine will have to be taken.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperpituitarism, Data Base

342. **4** Because the pituitary gland is located in the brain, edema after surgery may result in increased intracranial pressure. Early signs include decreased visual acuity, papilledema, and unilateral pupillary dilation.

**1** Urinary retention may follow any surgery because of the effects of anesthesia and is not a specific occurrence following cranial surgery. **2** Respiratory distress is a later, not early, sign of increased intracranial pressure. This is a decompensated response indicated by altered respiratory pattern, decreased respiratory rate, and finally respiratory arrest. This occurs because of increasing pressure on the medulla. **3** Bleeding at the suture line may occur with any surgery, not just a hypophysectomy.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperpituitarism, Nursing Care

343. **1** Increased levels of steroids will accelerate bone demineralization.

**2** Hyperparathyroidism, not hypoparathyroidism, accelerates bone demineralization. **3** Weight-bearing that occurs with strenuous activity promotes bone integrity by preventing bone demineralization. **4** Although estrogen promotes deposition of calcium into bone, high levels will not be prescribed for osteoporosis; hormone replacement therapy is associated with an increased risk for breast cancer.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

344. **3** Clinical presentation of type 1 diabetes is characterized by acute onset, and therefore there is no time to develop the long-term complications that are common with long-standing disease; 20% of newly diagnosed clients with type 2 diabetes demonstrate complications because the diabetes has gone undetected for an extended period of time.

**1** Clinical presentation of type 1 diabetes is rapid, not slow, as pancreatic beta cells are destroyed by an autoimmune process; in type 2 diabetes, the body is still producing some insulin, and therefore the onset of signs and symptoms is slow. **2** In type 1 diabetes, clients are generally lean or have an ideal weight; 80% to 90% of clients with type 2 diabetes are overweight. **4** Type 1 diabetes requires diet control, exercise, and subcutaneous administration of insulin, not oral medications; oral medications are

used for type 2 diabetes because some insulin is still being produced.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

345. **1** Steroid therapy usually is instituted preoperatively and continued intraoperatively to prepare for the acute adrenal insufficiency that follows surgery.

**2** The diet must supply ample, not high, protein and potassium; however, it must be low in calories, carbohydrates, and sodium to promote weight loss and reduce fluid retention. **3** A 24-hour urine specimen is unnecessary. **4** Glucocorticoids must be administered preoperatively to prevent adrenal insufficiency during surgery.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Primary Aldosteronism, Data Base

346. **3** Excess glucocorticoids cause hyperglycemia, and signs of diabetes mellitus may develop.

**1** Adrenocortical hormones cause sodium retention and subsequent weight gain. **2** Although muscle wasting is associated with excessive corticoid production, this will not cause diabetes mellitus. **4** Adrenocorticotrophic hormone (ACTH) affects the adrenal cortex, not the pancreas.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Review of Anatomy and Physiology, Pituitary Gland

347. **2** Hyperplasia of the adrenal cortex leads to increased secretion of cortical hormones, which causes signs of Cushing syndrome.

**1** This malfunction of the pituitary will result in Simmonds disease (panhypopituitarism), which has clinical manifestations similar to those for Addison disease. **3** Cushing syndrome results from excessive cortical hormones. **4** Adrenocorticotrophic hormone (ACTH) stimulates production of adrenal hormones. Inadequate ACTH will result in Addisonian signs and symptoms.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Cushing Syndrome, Data Base

348. Answer: 1, 3.

**1** Excessive hairiness, especially a male pattern of hair distribution on a woman (hirsutism), occurs with Cushing syndrome because of an androgen excess. **2** Menorrhagia (excessive menstrual bleeding) does not occur; menses may cease or be scanty because of virilization. **3** Cushing syndrome results from excess adrenocortical activity. Hypercortisolism causes fat redistribution, resulting in "buffalo hump"; it also contributes to slow wound healing, hirsutism, weight gain, hypertension, acne, thin arms and legs, and behavioral changes. **4** Edema does not occur except when severe heart failure is present. **5** Headaches do not occur with this syndrome.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Cushing Syndrome, Data Base

349. Answer: 1, 2.

**1** Excess adrenocorticoids cause emotional lability, euphoria, and psychosis. **2** Hypercortisolism impairs the inflammatory response, slowing wound healing. **3** Increased secretion of androgens results in hirsutism. **4** Although a moon face is associated with corticosteroid therapy, ectomorphism is a term for a tall, thin, genetically determined body type and is unrelated to Cushing syndrome. **5** There is increased bruising because capillary fragility results in multiple ecchymotic areas.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Cushing Syndrome, Data Base

350. Answer: 2, 4, 5.

**1** Polyuria is associated with diabetes mellitus and primary aldosteronism, not Cushing syndrome. **2** Obesity is caused by the overproduction of adrenal cortisol hormone associated with Cushing syndrome. **3** Hypertension, not hypotension, is associated with Cushing syndrome because of sodium and water retention. **4** Sleep disturbance is caused by the altered diurnal secretion of cortisol. **5** Thin arms and legs are caused by protein catabolism, which causes muscle wasting.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Cushing Syndrome, Data Base

351. **2** As a result of increased cortisol levels, glucose metabolism is altered, which may contribute to an increase in blood glucose levels.

**1** Increased mineralocorticoids will decrease urine output. **3** Sodium is retained by the kidneys, but potassium is excreted. **4** The immune response is suppressed.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Review of Anatomy and Physiology, Pituitary Gland

352. **1** Depending on the purpose of the collection, a preservative to prevent breakdown of the specimen may be necessary.

**2** Weighing the client is not necessary. **3** The last specimen should be collected as close as possible to the end of the 24-hour period and added to the urine collected. **4** Collecting urine for the next 24 hours, not checking the I&O for the previous 24 hours, is important.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Addison Disease, Nursing Care

353. **4** Adrenal steroids help an individual adjust to stress. Unless received from external sources, there is no hormone available to cope with surgical stresses after an adrenalectomy.

**1** Glucose stores (glycogen) will be utilized by the body to adapt to surgery. Insulin is the hormone that facilitates conversion of glucose to glycogen. **2** Steroids do not increase inflammatory reactions. **3** Steroids will result in fluid retention, not loss.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Primary Aldosteronism, Data Base

354. **4** Hydrocortisone succinate (Solu-Cortef) is a glucocorticoid. A client undergoing bilateral adrenalectomy must be given adrenocortical hormones so that adjustment to

the sudden lack of these hormones that occurs with this surgery can take place.

**1** This medication is used to treat a client with hyperthyroidism, not a client with a bilateral adrenalectomy. **2** Because the surgery involves the adrenal glands, not the pituitary gland, secretion of pituitary hormones will not be affected. **3** This is not necessary. Insulin is produced by the pancreas, and its function is not altered by this surgery.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

355. **1** After an adrenalectomy, adrenal insufficiency causes hypotension because of fluid and electrolyte alterations.

**2** Hypoglycemia, not hyperglycemia, may be a problem stemming from the loss of glucocorticoids. **3** Hyponatremia may occur because of the lack of mineralocorticoid production. **4** Potassium, not sodium, ions may be retained because of the lack of mineralocorticoids.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 9, Primary Aldosteronism, Nursing Care

356. **3** Clients with adrenocortical insufficiency who are receiving steroid therapy usually require increased amounts of medication during periods of stress because they are unable to produce the increased levels of glucocorticoids needed by the body at this time.

**1** Although sedation may be prescribed, the major concern is the regulation of glucocorticoids in the presence of emotional or physiologic stress. **2** Increased stress requires increased glucocorticoids. **4** Although these symptoms may occur and may be minimized by an increase in glucocorticoids, the primary reason for an adjustment in dosage is to assist the body's ability to adapt to stress.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 9, Primary Aldosteronism, Nursing Care

357. **4** A client with Cushing syndrome secretes excess amounts of cortisol, a corticosteroid that acts to retain sodium and water, resulting in hypernatremia and edema.

**1** Hypervolemia, not hypovolemia, is caused by fluid retention. **2** Hypokalemia, not hyperkalemia, occurs because potassium is lost when there is sodium retention. **3** Hyperglycemia, not hypoglycemia, results from cortisol-induced glucose intolerance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 9, Cushing Syndrome, Data Base

358. **4** Clients with Cushing syndrome must limit their intake of salt and increase their intake of potassium. The kidneys are retaining sodium and excreting potassium.

**1** An excessive secretion of adrenocortical hormones in Cushing syndrome, not increased or high sodium intake, is the problem. **2** Although sodium retention causes fluid retention and weight gain, the need for increased potassium also must be

considered. **3** Because of steroid therapy, excess sodium may be retained although potassium may be excreted.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 9, Cushing Syndrome, Data Base

359. **4** Mineralocorticoids such as aldosterone cause the kidneys to retain sodium ions. With sodium, water is also retained, elevating blood pressure. Absence of this hormone thus causes hypotension.

**1** Estrogen is a female sex hormone produced by the ovaries; it does not affect blood pressure. **2** Androgens are produced by the adrenal cortex. Androgens have an effect similar to that of the male sex hormones; they do not affect blood pressure. **3** The major effect of glucocorticoids such as hydrocortisone is on glucose metabolism, not on sodium and water concentrations; absence of this hormone will not cause significant hypotension.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 9, Addison Disease, Data Base

360. **1** Because of diminished glucocorticoid production, there is a decreased response to stress, reducing the ability to fight an infectious process.

**2** Hyponatremia and hyperkalemia occur in this disorder; however, these do not alter the defense against infection. **3** Glucocorticoids are involved with metabolism; however, this does not directly affect susceptibility to infection. **4** The respiratory system is not affected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 9, Addison Disease, Nursing Care

361. **3** Glucocorticoids help maintain blood glucose and liver and muscle glycogen content. A deficiency of glucocorticoids causes hypoglycemia, resulting in breakdown of protein and fats as energy sources.

**1** Muscular weakness and fatigue are related to fluid balance, but emaciation is not. **2** Emaciation results from diminished protein and fat stores and hypoglycemia, not from an alteration in electrolytes. **4** Masculinization does not occur in this disease.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 9, Addison Disease, Data Base

362. **2** Exertion, either physical or emotional, places additional stress on the adrenal glands, which may precipitate an addisonian crisis.

**1** Because of increased metabolic demands as a result of exercise, decreased levels of adrenocortical hormones will cause fatigue. **3** Restricting fluid intake is contraindicated because of the risk for hypovolemia. **4** The nurse should assess for hyperkalemia and hyponatremia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 9, Addison Disease, Nursing Care

363. **3** Lack of mineralocorticoids causes hyponatremia, hypovolemia, and hyperkalemia. Dietary modification and administration of cortical hormones are aimed at correcting these electrolyte imbalances, which can be life threatening.

**1** There is no disturbance in the eosinophil count. **2** Lymphoid tissue does not

change. **4** Although glucocorticoids are involved in metabolic activities, including carbohydrate metabolism, the primary aim of therapy is to restore electrolyte imbalance.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Addison Disease, Data Base

364. **4** Lack of mineralocorticoids (aldosterone) leads to loss of sodium ions in the urine and subsequent hyponatremia.

**1** Potassium intake is not encouraged; hyperkalemia is a problem because of insufficient mineralocorticoids. **2** This disease is caused by idiopathic atrophy of the adrenal cortex; tissue repair of the gland is not possible. **3** Vitamins are not directly energy-producing, nor will they help the client gain weight.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Addison Disease, Nursing Care

365. Answer: 1, 2.

**1** Fludrocortisone (Florinef) has a strong effect on sodium retention by the kidneys, which leads to fluid retention, causing edema. **2** Fludrocortisone has a strong effect on sodium retention by the kidneys, which leads to fluid retention, causing weight gain. **3** Fatigue may occur with adrenal insufficiency and is not related to cortisone therapy. **4** Unpredictable changes in mood commonly occur but are not as serious a threat as fluid retention. **5** Fluid retention and thus decreased urination may occur.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

366. Answer: 1, 2, 4.

**1** Polyuria is excessive urination associated with osmotic diuresis. **2** Polydipsia is excessive thirst associated with hyperglycemia; thirst is the response to osmotic diuresis and glycosuria. **3** Polyphagia is associated with the catabolic state induced by insulin deficiency. **4** Polyphasia is excessive talking associated with mental illness, not hyperglycemia. **5** This is related to multiple developmental abnormalities and is unrelated to hyperglycemia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

367. **4** Results in this range indicate diabetes.

**1** Results in this range indicate hypoglycemia. **2** Results in this range are considered expected (normal). **3** Results in this range indicate prediabetes according to the American Diabetes Association.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

368. **3** As a result of osmotic pressures created by an increased serum glucose level, the cells become dehydrated; the client must receive fluid and then insulin.

**1** Oxygen therapy is not necessarily indicated. **2** Carbohydrates will increase the blood glucose level, which is already high. **4** Although dietary instruction may be appropriate

later, such instruction is inappropriate during the crisis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

369. **1** In starvation there are inadequate carbohydrates available for immediate energy, and stored fats are used in excessive amounts, producing ketones.

**2** There is no fat in alcohol; fat oxidation does not occur. **3** Bone healing does not require the use of great amounts of fat; calcium is deposited to form callus. **4** A positive nitrogen balance does not require the use of great amounts of fat.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

370. **4** Oral hypoglycemics may be helpful when some functioning of the beta cells exists, as in type 2 diabetes.

**1** Rapid-acting regular insulin is needed to reverse ketoacidosis. **2** Obesity does not offer enough information to determine the status of beta cell function. **3** Clients with type 1 diabetes have no functioning beta cells; the necessary treatment is insulin, not an oral hypoglycemic.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

371. Answer: 2, 3, 4.

**1** Thirst occurs with hyperglycemia in response to dehydration associated with osmotic diuresis. **2** Palpitations, an adrenergic symptom, occur as the glucose level decreases; the sympathetic nervous system is activated, and epinephrine and norepinephrine are secreted, causing this response. **3** Diaphoresis is a sympathetic nervous system response that occurs as epinephrine and norepinephrine are released. **4** Slurred speech is a neuroglycopenic symptom; as the brain receives insufficient glucose, the activity of the CNS becomes depressed. **5** Hyperventilation occurs with diabetic ketoacidosis; Kussmaul respirations are an effort to counteract the effects of a buildup of ketones as the body seeks acid-base balance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

372. **2** Ketones are produced when fat is broken down for energy.

**1** Although rarely used, sodium bicarbonate may be administered to correct the acid-base imbalance resulting from ketoacidosis; acidosis is caused by excess acid, not excess base bicarbonate. **3** Diabetes does not interfere with removal of nitrogenous wastes. **4** Carbohydrate metabolism is impaired in the client with diabetes.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

373. **2** Infection increases the body's metabolic rate, and insulin is not available for increased demands.

**1** Although emotional stress will affect glucose levels, diabetic ketoacidosis will rarely result. **3** Increased insulin dose will lead to insulin coma (hypoglycemia) if diet is not increased as well. **4** This will result in insulin coma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

374. **1** IV fluids are given to combat dehydration in ketoacidosis and to keep an IV line open for administration of medications. After electrolyte levels are evaluated, potassium may be added along with insulin.

**2** In acidosis, potassium ions initially shift from the intracellular to extracellular compartment, resulting in hyperkalemia; as acidosis is corrected, hypokalemia may occur and then potassium may be administered. **3** This is an intermediate-acting insulin; rapid-acting insulin is indicated in an emergency. **4** This is not indicated; abnormally high serum potassium levels will revert once dehydration is corrected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

375. **4** Regular insulin (Novolin R) is rapid-acting and should be used for diabetic coma.

**1** Insulin lispro (Humalog) is too short-acting and must be administered concurrently with a longer-acting insulin. **2** Insulin glargine (Lantus) is a long-acting insulin, which is not indicated in an emergency. **3** NPH insulin (Novolin N) is intermediate-acting insulin; it is not indicated for use in an emergency.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

376. **Answer: 4 tablets.** First convert 2 g to its equivalent in mg by multiplying by 1000 (move the decimal 3 places to the right). Use the “Desired over Have” formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{2000 \text{ mg}}{500 \text{ mg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$500 x = 2000$$

$$x = 2000 \div 500$$

$$x = 4 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

377. **3** Kussmaul respirations occur in diabetic coma as the body attempts to correct a low pH caused by accumulation of ketones (ketoacidosis); HHNS affects people with type 2 diabetes who still have some insulin production; the insulin prevents the breakdown of fats into ketones.

**1** Fluid loss is common to both because an increased blood glucose level ultimately leads to polyuria. **2** Glycosuria is common to both conditions. **4** Hyperglycemia is common to both conditions.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

378. **1** The ketones produced excessively in diabetes are a by-product of the breakdown of body fats and proteins for energy; this occurs when insulin is not secreted or is unable to be utilized to transport glucose across the cell membrane into the cells. The major ketone, acetoacetic acid, is an alpha-ketoacid that lowers the blood pH, resulting in acidosis.

**2** Glucose does not change the pH. **3** Lactic acid is produced as a result of muscle contraction; it is not unique to diabetes. **4** Glutamic acid is a product of protein metabolism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

379. **2** The fingertip is preferred for glucose monitoring if hypoglycemia, not hyperglycemia, is suspected.

**1** This will increase blood flow, which helps to minimize the difference between forearm and fingertip results, although it does not eliminate them. **3** In a study in which rapidly fluctuating glucose levels were initiated, glucose levels at the forearm were significantly lower than samples from the fingertips; the fingertip should be used when testing before, during, and after exercising; before driving; after eating; and during illness; the fingertip most closely reflects a current glucose level. **4** Not all glucose monitors on the market can be used for AST.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Data Base

380. **1** The forearm glucose monitor is calibrated to be consistent with results obtained from a fingerstick.

**2** Individuals of all ages can use these glucose monitors. **3** A different scale is not used for each monitor; accompanying literature will indicate if the monitor reading reflects venous blood values even though capillary blood is used. **4** There is no difference in the time required to complete the test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

381. **4** The urinary catheter and drainage bag should always remain a closed sterile system; urine should be drawn only from the catheter port, not the collection bag.

**1, 3** The system should remain closed so that fewer microorganisms enter the urinary

tract. **2** This will not yield a fresh specimen indicating present acetone levels.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

382. **2** The guidelines from the American Diabetes Association have lowered the level of a fasting plasma glucose (FPG) that indicates whether a client has prediabetes from 110 mg/dL to 100 mg/dL; an FPG of 100 to 125 mg/dL is considered prediabetes.

**1** This FPG indicates that the client is hypoglycemic. **3, 4** An FPG of 126 mg/dL or higher indicates that the client has diabetes.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

383. Answer: 1, 4.

**1** Irritability, a neuroglycopenic symptom, occurs when the glucose in the brain declines to a low level. **2** Because the blood glucose level is decreased, the renal threshold is not exceeded, and there is no glycosuria. **3** Hot, dry skin is consistent with dehydration, which is often associated with hyperglycemic states. **4** Heart palpitations, a neurogenic symptom, occur when the sympathetic nervous system responds to a rapid decline in blood glucose. **5** Fruity odor of the breath is associated with hyperglycemia; it is caused by the breakdown of fats as a result of inadequate insulin supply.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

384. **1** In the absence of insulin, which facilitates the transport of glucose into cells, the body breaks down proteins and fats to supply energy; ketones, a by-product of fat metabolism, accumulate, causing metabolic acidosis (pH below 7.35).

**2** The pH of food ingested has no effect on the development of acidosis. **3** The opposite is true. **4** Cholesterol level has no effect on the development of acidosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

385. Answer: 3, 4.

**1** Too much insulin will precipitate insulin coma (hypoglycemia). **2** Exercise uses glucose for muscle contraction, decreasing the blood glucose level; this may precipitate insulin coma (hypoglycemia). **3** Emotional stress stimulates the sympathetic nervous system, which releases glucocorticoids, ultimately increasing the blood glucose level. **4** The stress of an infection increases metabolism and the production of glucocorticoids, resulting in an elevated blood glucose level. **5** Not eating enough calories in relation to the amount of insulin received may precipitate insulin coma (hypoglycemia).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

**Assessment/Analysis;** **Reference:** Ch 9, Diabetes Mellitus, Data Base

386. Answer: 3, 5.

**1** As the glucose level decreases in hypoglycemia, the sympathetic nervous system is activated, and epinephrine and norepinephrine are secreted, causing diaphoresis. **2** Retinopathy is a long-term complication of diabetes caused by

microvascular changes in the retina; it is not a sign of ketoacidosis. **3** A fruity odor to the breath (acetone breath) occurs when the ketone level is elevated in ketoacidosis. **4** With ketoacidosis the serum bicarbonate level is decreased, not increased, in an effort to neutralize ketones when seeking acid-base balance. **5** Metabolic acidosis initiates respiratory compensation in the form of Kussmaul respirations to counteract the effects of ketone buildup, resulting in a decreased arterial carbon dioxide level.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

387. Answer: 1, 2, 3.

**1** Dry skin is a sign of dehydration in response to polyuria associated with the osmotic effect of an elevated serum glucose level. **2** Abdominal pain is associated with diabetic ketoacidosis. **3** In the absence of insulin, glucose cannot enter the cell or be converted to glycogen, so it remains in the blood. Breakdown of fats as an energy source causes an accumulation of ketones, which results in acidosis. The lungs, in an attempt to compensate for lowered pH, will blow off CO<sub>2</sub> (Kussmaul respirations). **4** An absence of ketones in the urine indicates adequate production of glucose for energy. Insulin deficiency stimulates production of ketones as a by-product of fat oxidation for energy. **5** This indicates hypoglycemia, not ketoacidosis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

388. **1** Acetylcysteine (Acetadote) is an antioxidant that scavenges oxygen free radicals, which are released when contrast medium causes cell death to renal tubular tissue; it also induces slight vasodilation.

**2** Contrast that is renal friendly does not exist. **3** Mannitol (Osmitrol) is not necessary. Saline alone provides better protection of the kidneys from contrast-induced nephropathy. **4** Hydration with saline, not dextrose and water, affords some protection from kidney damage caused by contrast media; dextrose will increase the glucose level in an individual with diabetes and thus is contraindicated.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

389. **3** Glucose gel delivers a measured amount of simple sugars to provide glucose to the blood for rapid action.

**1** Acidosis occurs when there is an increased serum glucose level; therefore, glucose gel is not indicated. **2** Diabetes mellitus involves a decreased insulin production. **4** Glucose gel is not indicated in idiosyncratic reactions to insulin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

390. **4** The bicarbonate-carbonic acid buffer system helps maintain the pH of body fluids; in metabolic acidosis there is a decrease in bicarbonate because of an increase of

metabolic acids.

**1** The pH is decreased. **2** The  $\text{PO}_2$  is not decreased in diabetic acidosis. **3** The  $\text{PCO}_2$  may be decreased by the body's attempt to eliminate  $\text{CO}_2$  to compensate for a decreased pH.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Diabetes Mellitus, Data Base

391. **3** A simple sugar provides glucose to the blood for rapid action.

**1** It does not inhibit glycogenesis. **2** It does not stimulate the release of insulin. **4** It does not stimulate the storage of glucose.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

392. **4** Insulin stimulates cellular uptake of glucose and also stimulates the sodium/potassium pump, leading to the influx of potassium into cells. The resulting hypokalemia is offset by parenteral administration of potassium.

**1** Potassium is not lost from the body by profuse diaphoresis. **2** Potassium moves from the extracellular to the intracellular compartment rather than being excreted in the urine. **3** Anabolic reactions are stimulated by insulin and glucose administration; potassium is drawn into the intracellular compartment, necessitating a replenishment of extracellular potassium.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

393. Answer: 1, 2, 5.

**1** Hypoglycemia triggers the sympathetic nervous system, which releases epinephrine, in turn causing vasoconstriction and pallor. **2** Tremors are a sympathetic nervous system response to hypoglycemia. **3** Because blood glucose concentration is decreased in hypoglycemia, the renal threshold is not exceeded and there is no glycosuria. **4** Acetonuria is associated with hyperglycemia; it is caused by the breakdown of fats as a result of inadequate insulin supply. **5** Diaphoresis results from the release of epinephrine by the sympathetic nervous system.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Data Base

394. **1** Liquids containing simple carbohydrates are most readily absorbed and thus increase the blood glucose level quickly.

**2** Although a solution of 50% dextrose may be given if the client is comatose, 5% dextrose does not supply sufficient carbohydrates. **3** This will not alter the current situation. **4** Complex carbohydrates and protein take longer to increase the blood glucose level, so they should be administered after a simple carbohydrate.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

395. **2** A combination of diet, exercise, and medication is necessary to control the disease; the interaction of these therapies is reflected by the serum glucose level.

**1** Weight loss may occur with inadequate insulin. **3** Acquisition of knowledge does not

guarantee its application. **4** Insulin alone is not enough to control the disease.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

396. **3** A value of 258 mg/dL is above the expected range of 70 to 100 mg/dL; the nurse should administer the regular insulin (Novolin R) as prescribed.

**1** This is unnecessary; a prescription for insulin exists and should be implemented. **2** This is insufficient to lower a glucose level this high. **4** This is contraindicated because it will increase the glucose level further; orange juice, a complex carbohydrate, and a protein should be given if the glucose level is too low.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

397. **4** A slower, longer period of time to break in new, stiff shoes will help prevent blisters and skin breakdown.

**1** The toenails should be cut by a podiatrist; they usually are cut after a foot bath when the nails are softer. **2** This will cause maceration of the skin and should be avoided. **3** This is too long a period of time; the client should examine the feet daily for signs of trauma.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

398. **2** Each client should be given an individually devised diet selecting commonly used foods from the American Diabetic Association diet; family members should be included in the diet teaching.

**1** Rigid diets are difficult to follow; appropriate substitutions are permitted. **3** Nutritional requirements are different for each individual, depending on many factors, such as activity level, degree of compliance, and physical status. **4** These foods can be eaten when accounted for in the dietary regimen.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Data Base

399. Answer: 1, 3, 2, 4.

**1** Air should be injected into the NPH insulin (Novolin N) vial first, which allows withdrawal of the NPH insulin at a later step in the procedure without having to instill air into the vial from a syringe that contains regular insulin (Novolin R). **3** Instilling air into the regular insulin vial increases the pressure in the vial, facilitating removal of the required dose. **2** Removing the desired dose of insulin while the needle is still in the vial reduces the risk of contamination by repeated punctures, and it maintains the sharpness of the needle. Having the syringe contain regular insulin first prevents the need to withdraw the regular insulin into a syringe that contains NPH insulin and inadvertently contaminating the regular insulin vial with the longer-acting NPH insulin; contaminating regular insulin with NPH insulin will reduce the speed at which the regular insulin functions, which in turn will delay treatment of a hyperglycemic

event. **4** Finally, the required dose of NPH insulin can be removed from the NPH insulin vial.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

400. **1** Insulin lispro (Humalog) has an onset of 0.25 hours, a peak action of 0.5 to 1.5 hours, and a duration of 3 to 4 hours.

**2** Insulin glargine (Lantus) has an onset of 1 to  $1\frac{1}{2}$  hours, no peak action, and a duration of 20 to 24 hours. **3** NPH insulin (Novolin N) has an onset of 1.5 hours, a peak action of 4 to 12 hours, and a duration of 18 to 24 hours. **4** Regular insulin (Novolin R) has an onset of 0.5 hours, a peak action of 1 to 5 hours, and a duration of 6 to 10 hours.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

401. **1** An understanding of the diet is imperative for adherence. A balance of carbohydrates, proteins, and fats usually apportioned over three main meals and two between-meal snacks needs to be tailored to the client's specific needs, with consideration of exercise and pharmacologic therapy.

**2** A total dietary regimen proportioning carbohydrates, proteins, and fats must be followed, not just sugar restriction; salt is not restricted. **3** This is true; however, digestion is not the basis for the client's problems. **4** Total caloric intake, rather than the size of meals, is the major factor in weight gain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

402. **3** The protein in milk and cheese may be slowly converted to glucose (gluconeogenesis), providing the body with some glucose during sleep while the NPH insulin (Novolin N) is still acting.

**1** The purpose of an evening snack is to cover for insulin activity during sleep. **2** This is not the purpose of an evening snack for a person taking insulin. **4** The foods chosen are rich in protein and will be utilized slowly.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

403. **3** The expected range of glycosylated hemoglobin ( $HbA_{1c}$ ) is 4.4% to 6.4%. A value of 6% is within the expected range. Glycosylated hemoglobin measures the average blood glucose level for the 90- to 120-day period before the blood sample is collected; thus, it is a reliable way to measure adherence to a therapy plan of insulin, diet, and exercise.

**1** A glycosylated hemoglobin measurement does not measure rebound hyperglycemia (Somogyi effect). **2** The  $HbA_{1c}$  fraction of hemoglobin is measured, and its value is not affected by short-term infractions of diet or the type of insulin the client takes. **4** This client does not require further teaching because the laboratory result is within the expected range, indicating adherence to a therapy plan of insulin, diet, and exercise.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Data Base

404. **1** The Somogyi effect is a response to hypoglycemia induced by too much insulin; the body responds to the hypoglycemia by counterregulatory hormones stimulating lipolysis, gluconeogenesis, and glycogenolysis, resulting in rebound hyperglycemia.

**2** The Dawn phenomenon is hyperglycemia that is present on awakening in the morning due to the release of counterregulatory hormones in the predawn hours; it is thought that growth hormone and/or cortisol are related to this phenomenon. **3** Diabetic ketoacidosis (diabetic coma) is a profound deficiency of insulin and is characterized by hyperglycemia, ketosis, acidosis, and dehydration. **4** Hyperosmolar nonketotic syndrome occurs in clients with type 2 diabetes. It is a condition in which the client produces enough insulin to prevent diabetic ketoacidosis but not enough to prevent severe hyperglycemia, osmotic diuresis, and extracellular fluid depletion.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Mellitus, Data Base

405. Answer: 1, 2, 3.

**1** Clients with diabetes often have peripheral neuropathies and are unaware of discomfort or pain in the feet; the feet should be examined every night for signs of trauma. **2** Well-fitting shoes prevent pressure and rubbing that can cause tissue damage and the development of ulcers. **3** Daily exercise increases the uptake of glucose by the muscles and improves insulin utilization. **4** This may cause a pastelike residue between the toes that may macerate the skin and promote bacterial and fungal growth. **5** Generally this is unnecessary. **6** Clients with diabetes often have peripheral neuropathy and are unable to accurately evaluate the temperature of bathwater, which can result in burns if the water is too hot.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

406. **1** During treatment for acidosis, hypoglycemia may develop; careful observation for this complication should be made by the nurse.

**2** Withholding all glucose may cause insulin coma. **3** Whole milk and fruit juices are high in carbohydrates, which are contraindicated immediately following ketoacidosis. **4** The regulation of insulin depends on the prescription for coverage; the prescription usually depends on the client's blood glucose level rather than ketones in the urine.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Antidiabetics Agents

407. **1** Because the client has type 1 diabetes, it is essential that the blood glucose level be determined before meals to evaluate the level of control of diabetes and the possible need for insulin coverage.

**2** To prevent flexion contractures of the hip, the client should not sit for a prolonged time. This is not the priority. **3** Raising the head of the bed flexes the hips, which may result in hip flexion contractures. This is not the priority. **4** This may result in a hip

flexion contracture and should be avoided.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

408. **3** The abdomen is the preferred site for an insulin injection because it is easily accessible and absorption is more even and rapid than when it is injected in the extremities.

**1, 2, 4** This is not the preferred site for the administration of insulin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Diabetes Mellitus, Nursing Care

409. **1** Myxedema is the severest form of hypothyroidism. Decreased thyroid gland activity means reduced production of thyroid hormones.

**2** Acromegaly results from excess growth hormone in adults once the epiphyses are closed. **3** Graves disease results from an excess, not a deficiency, of thyroid hormones. **4** Cushing disease results from excess glucocorticoids.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hypothyroidism, Data Base

410. **2** Propylthiouracil (PTU) is a thyroid hormone antagonist that inhibits thyroid hormone synthesis by decreasing the use of iodine in the manufacture of these hormones.

**1** PTU does not affect the vascularity of the thyroid gland. **3** Iodine-containing agents are given for severe hyperthyroidism and before a thyroidectomy. **4** PTU does not affect the amount of already formed thyroid hormones.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Thyroid Inhibitors

411. Answer: 3, 4.

**1** Lethargy, rather than irritability, is expected. **2** Decreased metabolism requires less oxygen, so the pulse rate is generally slower. **3** A decrease in metabolism will result in a gain in weight. **4** Decreased production of thyroid hormones lowers metabolism, which leads to decreased heat production and cold intolerance. **5** The skin is dry and coarse, not moist.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hypothyroidism, Data Base

412. Answer: 1, 3.

**1** Excessive thyroid hormones increase the metabolic rate, causing an increase in intestinal peristalsis. **2** Listlessness occurs with hypothyroidism because of a decreased metabolic rate. **3** Excessive thyroid hormones increase the metabolic rate, causing weight loss. **4** A slow pulse rate accompanies hypothyroidism, not hyperthyroidism, because of a decreased metabolic rate. **5** Appetite increases (polyphagia) with hyperthyroidism in an effort to meet metabolic needs.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hyperthyroidism, Data Base

413. **3** An individual treated for a thyroid problem by intake of radioactive iodine ( $^{131}\text{I}$ ) becomes mildly radioactive, particularly in the region of the thyroid gland, which preferentially absorbs the iodine. Such clients should be treated with routine safety precautions for 48 hours (e.g., avoid prolonged contact or near-contact with others; flush toilet twice after using, since radioactive iodine is excreted via the urine; and thoroughly wash hands after toileting).

**1, 4** Because radioactive iodine is internalized, the client becomes the source of radioactivity. **2** The amount of radioactive iodine used is not enough to cause high radioactivity.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

414. **3** Potassium iodide (SSKI) adds iodine to the body fluids, exerting negative feedback on the thyroid tissue and decreasing its metabolism and vascularity.

**1** Vasopressin (Pitressin) is a pituitary hormone. **2** Propylthiouracil (PTU) interferes with production of thyroid hormone but causes increased vascularity and size of the thyroid. **4** Levothyroxine (Synthroid) is a thyroid hormone that may be administered after a thyroidectomy if the client develops hypothyroidism.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Thyroid Inhibitors

415. **1** If the laryngeal nerves are injured bilaterally during surgery, the vocal cords will tighten, interfering with speech. If one cord is affected, hoarseness develops. This can be evaluated simply by having the client speak every hour.

**2, 3, 4** This ability is not influenced by laryngeal nerve damage.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

416. **2** A decreased TSH (thyroid stimulating hormone) assay together with an elevated  $\text{T}_3$  (triiodothyronine) level may indicate hyperthyroidism.

**1** X-ray results will not indicate thyroid disease, and elevation of  $\text{T}_4$  (thyroxine) level might indicate hyperthyroidism. However, this may be a false reading because of the presence of thyroid-binding globulin (TBG) and is inadequate for diagnosis when used alone. **3**  $\text{PO}_2$  is not specific to thyroid disease, and the thyroglobulin level is most useful to monitor for recurrence of thyroid carcinoma or response to therapy. **4** The results with the sequential multichannel autoanalyzer (SMA) are not specific to thyroid disease; the protein-bound iodine test is not definitive because it is influenced by the intake of exogenous iodine.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 9, Hyperthyroidism, Data Base

417. **1** Because of the individual's increased metabolic rate, a high-calorie diet is needed to meet the energy demands of the body and prevent weight loss.

**2** Sodium is not restricted because clients with hyperthyroidism perspire heavily and lose sodium. **3** GI motility is increased and does not require the additional stimulus of

increased roughage. **4** Modification of dietary consistency is unnecessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Processes:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

418. **4** The first and most important observation should be for respiratory obstruction. If this occurs, treatment must be instituted immediately.

**1** This is a later concern; urinary retention will not occur in the immediate postoperative period. **2** This may result from the anesthesia; however, it is not life-threatening and usually passes. **3** The blood pressure is not significantly affected by this type of surgery; however, surgery itself can influence blood pressure. If the blood pressure significantly increases, other symptoms of thyroid crisis (storm) will be present.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

419. **1** Parathyroid removal eliminates the body's source of parathyroid hormone (parathormone), which increases the blood calcium level. The resulting low body fluid calcium affects muscles, including the diaphragm, resulting in dyspnea, asphyxia, and death.

**2** Loss of the thyroid gland will upset thyroid hormone balance and may cause myxedema. **3** The parathyroids are not involved in regulating plasma volume; the pituitary and adrenal glands are responsible. **4** The parathyroids do not regulate the adrenal glands.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

420. **1** These signs may indicate calcium depletion as a result of accidental removal of parathyroid glands during thyroidectomy.

**2** Symptoms associated with hypomagnesemia include tremor, neuromuscular irritability, and confusion. **3** Symptoms associated with metabolic acidosis include deep, rapid breathing, weakness, and disorientation. **4** Symptoms associated with hypokalemia include muscle weakness and dysrhythmias.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

421. **3** Thyroid surgery sometimes results in accidental removal of the parathyroid glands. A resultant hypocalcemia may lead to contraction of the glottis, causing airway obstruction; edema around the operative site also may cause an airway obstruction.

**1** A patent airway takes priority. **2** Speaking is important to determine the status of the laryngeal nerve. **4** The semi-Fowler position is indicated to maximize respiratory excursion.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

422. **3** Soreness is to be expected. A progression to a soft diet will provide nutrients needed for healing and energy and will stimulate the return of bowel activity. Analgesics as prescribed will reduce soreness during meals.

**1** This is not within the legal role of the nurse. **2** Soreness is to be expected; this is not an emergency necessitating medical action. **4** The soreness is not because of drying; when the client is at home, humidified air might help reduce the soreness, but it will not help the client eat the soft diet. Gargling involves hyperextension of the neck which may put tension on the suture line.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

423. Answer: 1, 2.

**1** Dry skin results from a decrease in the metabolic rate, which is associated with hypothyroidism. **2** Dry, brittle hair results from a decrease in the metabolic rate, which is associated with hypothyroidism. **3** Weight loss is associated with hyperthyroidism because of an increase in body metabolism. **4** Resting tremors are not associated with hypothyroidism; they are associated with Parkinson disease. **5** Heat intolerance is associated with hyperthyroidism, not hypothyroidism, because of the increase in body metabolism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hypothyroidism, Data Base

424. Answer: 5 tablets. First convert 0.125 mg to its equivalent in mcg by multiplying by 1000 (move the decimal 3 places to the right). Use the "Desire over Have" formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{125 \text{ mcg}}{25 \text{ mcg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$25 x = 125$$

$$x = 125 \div 25$$

$$x = 5 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

425. Answer: 1, 3, 4.

**1** Tinted glasses decrease light impacting on the eyes and protect eyes that are photosensitive. **2** Cool, moist compresses are used to relieve irritation; warm

compresses cause vasodilation, which may aggravate tissue congestion. **3** Elevating the head of the bed 45 degrees will promote a decrease in periorbital fluid. **4** Taping the eyelids shut at night if they do not close reduces the risk of corneal dryness, which can lead to infection or injury. **5** Artificial tears are used to moisten the eyes, not a petroleum-based jelly.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Hyperthyroidism, Nursing Care

426. **3** Hyperparathyroidism causes calcium release from the bones, leaving them porous, weak, and painful.

**1** Tetany is the result of low calcium levels; in this condition the serum calcium level is increased. **2** Seizures are caused by increased neural activity, a condition not related to this disease. **4** Graves disease is the result of increased thyroid, not parathyroid, activity.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hyperparathyroidism, Data Base

427. **1** Fluids help prevent the formation of renal calculi associated with high levels of serum calcium.

**2** Additional calcium intake may increase the already high levels of serum calcium. **3** Seizures are associated with low, not high, levels of serum calcium. **4** Bed rest is contraindicated because it accelerates bone destruction.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 9, Hyperparathyroidism, Nursing Care

428. Answer: 4, 5.

**1** Muscle tremors occur with hypocalcemia, not hypercalcemia. **2** Abdominal cramps occur with hypocalcemia, not hypercalcemia. **3** Increased intestinal peristalsis occurs with hypocalcemia, not hypercalcemia. **4** When the serum calcium level is increased, initially it causes tachycardia; as it progresses, it depresses electrical conduction in the heart, causing bradycardia. **5** Hypercalcemia causes decreased peristalsis identified by constipation and hypoactive or absent bowel sounds.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hyperparathyroidism, Data Base

429. Answer: 1, 2, 3.

**1** A pounding headache is secondary to the severe hypertension associated with excessive amounts of catecholamines. **2** Palpitations are associated with stimulation of the sympathetic nervous system due to catecholamines (epinephrine and norepinephrine). **3** Diaphoresis is associated with stimulation of the sympathetic nervous system due to excessive catecholamines. **4** Tachycardia, not bradycardia, is associated with stimulation of the sympathetic nervous system due to catecholamines. **5** Hypertension, not hypotension, is the principle clinical manifestation associated with pheochromocytoma because of stimulation of the sympathetic nervous system.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Pheochromocytoma, Data Base

430. **4** Having the client sit on the side of the bed for several minutes allows time for the blood pressure to adjust to the vertical position; this avoids dizziness and the potential for fainting or falling.

**1** The nurse should stand in front of the client to provide support when transferring any client from the bed to a chair. **2** Once the client is safely standing, the client can walk to a chair in the room no matter where it is positioned. **3** Although sturdy shoes with rubber soles are ideal when transferring a client from the bed to a chair, it is not the priority.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 9](#), Pheochromocytoma, Nursing Care

431. Answer: 4, 5.

**1** Chlorpromazine (Thorazine) causes an elevation in the vanillylmandelic acid (VMA) level and should be avoided during the test. Therefore, the health care provider should be consulted. **2** The client should rest and avoid physical activity during the test because activity increases VMA levels. **3** Salicylates increase VMA levels and should be avoided during the test. **4** All urine should be saved and refrigerated during the 24 hours of the test. Toilet paper or feces should not contaminate the specimen. **5** These nutrients, in addition to mints, bananas, vanilla, and tea increase the VMA level and should be avoided 3 days before and during the test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 9](#), Pheochromocytoma, Nursing Care

432. **1** The first voiding is discarded because that urine was in the bladder before the test began and should not be included.

**2** The last voiding should be placed in the specimen container because the urine was produced during the 24-hour time frame of the test. **3** This is not necessary; voided specimens are acceptable. **4** This is not necessary; this is done for clients with renal calculi.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 9](#), Pheochromocytoma, Nursing Care

# Integumentary System

433. **3** The temperature range for tepid applications is approximately body temperature. **1, 2** This temperature is too cool for a tepid bath. **4** This temperature is too hot for a tepid bath.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Data Base

434. **4** Conduction is the conveyance of energy such as heat, cold, or sound by direct contact.

**1** Direct contact is not necessary to convey heat by radiation. **2** Insulation refers to retention of heat, not its transfer. **3** Convection is the transfer of heat by air circulation (e.g., by fans or open windows).

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Review of Physical Principles: Heat

435. **3** Oxygen perfusion is impaired during prolonged edema, leading to tissue ischemia. **1, 2, 4** This is not a complication resulting from long-term edema.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Pressure Ulcers, Data Base

436. Answer: 1, 2, 3.

**1** Psoriasis is characterized by dry, scaly lesions that occur most frequently on the elbows, knees, scalp, and torso. **2** Pruritus is generally mild. **3** Sharply defined reddened papules or plaques covered by scales occur due to dermal inflammation; the inflammation occurs because of an abnormal growth of epidermal cells related to an autoimmune reaction. **4** Petechiae are not characteristic of psoriasis. **5** Macules are erythematous flat spots on the skin, as in measles.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Skin Lesions, Primary Skin Lesions, Secondary Skin Lesions

437. **2** Steroids are applied locally, and the lesions usually are covered with plastic wrap at night to reverse the inflammatory process.

**1** Solar rays may be used for treatment, but other forms of ultraviolet light are preferred. **3** Potassium permanganate is an antiseptic astringent used on infected, draining, or vesicular lesions. **4** The plaques are not necrotic and therefore do not require débridement.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Related Pharmacology, Antiinflammatory Agents

438. **1** Scabies is caused by the itch mite (*Sarcoptes scabiei*), the female of which burrows under the skin to deposit eggs. It is intensely pruritic and is transmitted by direct contact or in a limited way by soiled sheets or undergarments.

**2** It is caused by the itch mite, a parasite. **3** Scabies is an acute infestation. **4** It is a disease unrelated to allergies.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Related Pharmacology, Pediculicides/Scabicides

439. **3** Pemphigus is primarily a serious disease characterized by blisters filled with fluid. When they are less than 1 cm in diameter, they are called vesicles. When they are larger than 1 cm, they are called bullae.

**1, 2, 4** Pemphigus is a disease of the skin. It does not cause this response.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Skin Lesions, Primary Skin Lesions

440. Answer: 1, 3.

**1** The connective tissue degeneration of systemic lupus erythematosus (SLE) leads to involvement of the basal cell layer, producing a butterfly rash over the bridge of the nose and in the malar region. **2** This occurs in scleroderma; in an advanced stage the client has the appearance of a living mummy. **3** Polyarthrititis occurs in most clients, with joint changes similar to those seen in rheumatoid arthritis. **4** This occurs in muscular dystrophy; it is characterized by muscle wasting and weakness. **5** This occurs in polyarteritis nodosa, a collagen disease affecting the arteries and nervous system.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Systemic Lupus Erythematosus, Data Base

441. Answer: 1, 2, 3.

**1** Vitamin C should be encouraged because it is essential for the biosynthesis of collagen. **2** A fever is the major sign of an exacerbation. **3** A balance of rest and activity conserves energy and limits fatigue. Malaise, fatigue, and joint pain are associated with SLE. **4** Mild, not strong, soap and other skin products should be used on the skin. The skin should be washed, rinsed, and dried well and lotion applied. **5** This is not necessary. Exposure to ultraviolet light may damage the skin and aggravate the photosensitivity associated with SLE.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Systemic Lupus Erythematosus, Nursing Care

442. **1** Scleroderma is an immunologic disorder characterized by inflammatory, fibrotic, and degenerative changes.

**2, 3, 4** This is not involved in the development of scleroderma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Progressive Systemic Sclerosis (Scleroderma), Data Base

443. Answer: 3, 4, 5.

**1** Joint pain, caused by inflammation, is a symptom associated with scleroderma, not CREST syndrome. **2** Mask-like facies is a sign associated with scleroderma, not CREST syndrome; it is caused by fibrotic tissue changes. **3** Esophageal dysmotility is associated with CREST syndrome; it results in dysphagia and esophageal reflux. CREST: Calcium deposits in organs; Raynaud phenomenon; Esophageal dysfunction; Sclerodactyly (scleroderma of the digits); Telangiectasia (vascular lesions formed by

dilation of a group of small blood vessels). **4** Spider-like hemangiomas (telangiectasia) is associated with CREST syndrome. **5** Episodic blanching of the fingers (Raynaud phenomenon), caused by vasospasms of the arterioles, is a sign associated with CREST syndrome.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Progressive Systemic Sclerosis (Scleroderma), Data Base

444.

The sacrum bears the most pressure because it is the focal point of the weight of the body when in the low-Fowler position; also, shearing forces may cause local tissue trauma. Although other areas of the body are vulnerable, they do not bear as much body weight as the sacrum when the client is in the low-Fowler position.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Pressure Ulcers, Data Base

445. **2** This is a stage II pressure ulcer, a partial-thickness ulceration of epidermis and/or dermis; it presents as an abrasion, blister, or shallow crater; has a red/pink wound bed; there is no tissue sloughing; it may have an intact/open serum filled blister.

**1** A stage I ulcer has tissue injury with purple or maroon localized area of intact skin or blood-filled blister; the area may be firm, boggy, warmer, cooler, or painful in comparison with nearby tissue. **3** A stage III pressure ulcer has full-thickness ulceration involving the epidermis, dermis, and subcutaneous tissue; sloughing may be present; it presents as a deep crater with or without undermining; bone, tendon, or muscle is not exposed. **4** A stage IV pressure ulcer involves full-thickness skin loss and damage to muscle, bone, and/or tendon; sloughing or eschar may be present on parts of the wound bed; it often includes undermining and tunneling.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Pressure Ulcers, Data Base

446. **Answer: 2 tablets. First convert 0.22 g to its equivalent in mg by multiplying by 1000**

(move the decimal 3 places to the right). Use the “Desire over Have” formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire } 220 \text{ mg}}{\text{Have } 110 \text{ mg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$110 x = 220$$

$$x = 220 \div 110$$

$$x = 2 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration  
447. 4 Basal cell carcinoma, the most common type of skin cancer, is most closely linked to solar ultraviolet radiation.

1 Diet is not a risk factor. 2 Although skin type is a genetically determined risk factor, it cannot be altered and it is influenced by solar ultraviolet radiation. 3 Smoking is not a risk factor.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Cancer of the Skin, Data Base

448. 3 Lymphadenopathy occurs in clients with malignancies that have metastasized.  
1 The skin generally is dry and itchy. 2 Nikolsky sign (external layer of the skin becomes detached from the basal layer when rubbed by slight friction) occurs in clients with pemphigus, not melanoma. 4 Erythema of the palms is not a symptom of melanoma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Cancer of the Skin, Data Base

449. 2 Malignant melanoma of the eye is an intraocular tumor that metastasizes rapidly; therefore, enucleation (removal of the eye) is the treatment of choice.

1, 3, 4 This is only palliative at best.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Cancer of the Skin, Data Base

450. 4 A heterograft (xenograft) involves the grafting of tissues from a different species.

1 An isograft is when the donor and recipient are genetically identical (identical twins). 2 An allograft (homograft) is from a nonidentical donor of the same

species. **3** A homograft (allograft) is skin taken from a nonidentical donor of the same species.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

451. **Answer:** 22.5%. The front of the head is  $4\frac{1}{2}\%$ , and the anterior torso is 18%, for a total of  $22\frac{1}{2}\%$ .

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

452. **3** An increased hematocrit level indicates hemoconcentration secondary to fluid loss.

**1** The blood urea nitrogen level may be used to indicate dehydration from burns, but interpretation can be complicated by other conditions accompanying burns that also cause an increase in the BUN. **2** The pH level reflects acid-base balance. **4** An increase in the sedimentation rate indicates the presence of an inflammatory process, not fluid loss.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

453. **4** There is greater extravasation of fluid into the tissues as the amount of tissue involved increases. Thus, the relationship of fluid loss to body surface area is directly proportional. Several formulas (e.g., Evans, Baxter, Brooke Army Hospital) are used to estimate fluid loss based on percentage of body surface area burned.

**1, 2, 3** This is incorrect; the relationship is proportional.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

454. **1** The severe pain experienced by the client during débridement of burns places an emotional strain on the relationship.

**2** Maintaining sterility is not a problem if the nurse follows principles of surgical asepsis. **3** According to Maslow, basic needs of survival and safety take precedence over higher-level needs. Pain becomes all-encompassing, and the nurse must help the client cope with it. **4** This answer is not complete. The frequency with which the nurse must perform tasks is not the problem; rather, it is the pain associated with débridement and the nurse's inability to eliminate the pain.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Nursing Care

455. **1** Acceptance and a positive attitude by those in contact with the client will support the development of a positive body image by the client.

**2** Eventually the client may meet with other clients with burns, but this is not the priority. **3** Removing mirrors from the environment is unrealistic. **4** Avoidance of comments about the client's appearance is an unrealistic expectation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Nursing Care

456. **4** Partial-thickness burns are very painful; this outcome is specific, realistic, and measurable.

**1** This is the priority if the burns involved the head or anterior thorax. **2** Although important, this is not the primary goal at this time. **3** Ensuring urine output is generally more of a concern with burns that involve more than 5% of the body's surface area.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Nursing Care

457. **3** In deep partial-thickness burns, destruction of the epidermis and upper layers of the dermis and injury to deeper portions of the dermis occur.

**1** Eschar, a dry, leathery covering of denatured protein, occurs with full-thickness burns. **2** In full-thickness burns, total destruction of the epidermis, dermis, and some underlying tissue occurs. **4** In superficial partial-thickness burns, the epidermis is destroyed or injured, and a portion of the dermis may be injured.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

458. **2** The leukocyte count is not affected in the first few hours.

**1** Pain is present in partial-thickness burns because the sensory nerves are not damaged. **3** Inhalation of hot air can cause laryngeal edema and will be a concern. **4** Replacement of fluids and electrolytes is essential in all burned clients.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Nursing Care

459. **2** Potassium replacement generally is not indicated in the initial management of burns because hyperkalemia results from the liberation of potassium ions from the injured cells.

**1, 3** This is given to draw fluid from edematous tissue back into the bloodstream. **4** This is given to replace fluid and electrolytes.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Data Base

460. **3** The pulse rate is one indicator of optimum vascular fluid volume; the pulse rate decreases as intravascular volume normalizes.

**1** Decreasing CVP readings indicate hypovolemia. **2** Urinary output of 15 to 20 mL/hr indicates inadequate kidney perfusion; if fluid replacement is adequate, the urinary output should be more than 30 mL/hr. **4** A hematocrit level increasing from 50% to 55% indicates hypovolemia and hemoconcentration.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 10, Burns, Nursing Care

461. **4** The circulating air bed disperses body weight over a larger surface, which reduces pressure against the capillary beds, allowing for tissue perfusion.

**1** These beds are used for clients who are immobile; they do not increase mobility. **2, 3** This bed will have no effect on the development of this complication.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Nursing Care

462. **2** Medical asepsis and surgical asepsis are essential for prevention of infection with

the exposure method.

**1** Bathing is performed in a large tank tub. **3** Dressings are not used with the exposure method. **4** Clients are more comfortable with room temperatures of 85° F.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 10, Burns, Data Base

463. **3** Cerebral cells require high levels of oxygen. When the partial pressure of oxygen within the circulatory system falls, the client becomes restless and cognitive functions become impaired.

**1** With kidney failure the client becomes progressively confused and lethargic because of the buildup of toxins in the body. **2** At this stage the client is hypovolemic, not hypervolemic. **4** With metabolic acidosis the client is lethargic.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

464. **1** Fluid remobilization during the acute phase of burn injury results in hypokalemia because of diuresis and the movement of potassium back into the intracellular compartment.

**2** Hyperglycemia occurs during the acute phase because of lipolysis, gluconeogenesis, and glycogenolysis and a relative insulin insensitivity. **3** During the acute stage fluid shifts back into the intravascular compartment, resulting in an increased blood pressure. **4** During the acute stage fluid shifts back into the intravascular compartment, which increases the glomerular filtration rate. When the glomerular filtration rate increases, there is an increase in the urinary output. As the urinary output increases, the urine specific gravity decreases.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 10, Burns, Data Base

465. **Answer: 20 mL.** First convert 0.8 g to its equivalent in mg by multiplying by 1000 (move the decimal 3 places to the right). Use the “Desire over Have” formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{800 \text{ mg}}{200 \text{ mg}} = \frac{x \text{ mL}}{5 \text{ mL}}$$

$$200 x = 800 \times 5$$

$$200 x = 4000$$

$$x = 4000 \div 200$$

$$x = 20 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 2](#), Medication Administration, Nursing Responsibilities Related to Medication Administration  
466. **2** Necrotizing fasciitis destroys subcutaneous tissue and fascia and predisposes the client to infection and sepsis.

**1, 3** Although this concern is important, it is not the primary concern at this time. **4** Necrotizing fasciitis is a problem of the integument, not the urinary, system.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 10](#), Cellulitis, Data Base

# Neuromusculoskeletal System

467. Answer: 2, 4, 1, 3, 5.

2 Before transferring a client from the bed to a chair, the nurse needs to ensure that there is an order for “out of bed to a chair.” 4 Before explaining the transfer, the nurse must assess the stressors that may impact on the client’s ability to participate in the transfer. 1 Before the transfer the client should be informed about what is to be done and why. 3 Locked wheels ensure that the bed will not move during the transfer; this ensures the safety of the client and nurse. 5 Before transferring the client, the nurse should position the client in functional alignment to reduce any undue stress on muscles, joints, tendons, or ligaments during the transfer procedure.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Degenerative Disk Disease, Nursing Care

468. 4 Parasympathetic nerves increase peristalsis and GI secretion.

1 The parasympathetic nervous system increases intestinal motility, which may cause diarrhea. 2 Goose bumps (piloerection), caused by contraction of the muscoli arrectores pilorum, are under sympathetic control; vasoconstriction is also under sympathetic control. 3 Epinephrine is a sympathomimetic.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Autonomic Nervous System

469. 1 Cranial nerve I is the olfactory nerve that concerns the sense of smell; the ability to sense odors usually is affected when an intracranial lesion is present.

2 Cranial nerve II is the optic nerve and is concerned with sight. 3 Cranial nerve X is the vagus nerve and is concerned with the gag reflex, supplying parasympathetic fibers to body organs and transmitting sensory impulses from the viscera. 4 Cranial nerve VII is the facial nerve and is concerned with facial expressions, taste, and the salivary glands.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Cranial Nerves

470. 2 Hemiplegia is paralysis of one side of the body.

1 Paresis is a weakness or partial paralysis. 3 Paraplegia is the paralysis of both lower extremities and the lower trunk. 4 This is quadriplegia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

471. 1 The ache in muscles that have been vigorously worked without adequate oxygen supply is caused in part by the buildup of lactic acid. During rest, the lactic acid is oxidized completely to carbon dioxide and water, providing ATP for further muscular contraction.

2 Butyric acid is not a product of muscle contraction; it is a fatty acid occurring in feces, urine, and perspiration. 3 Acetoacetic acid is not a product of muscle contraction; it is a ketone body resulting from incomplete oxidation of fatty acids. It is also produced by

the metabolism of lipids and pyruvates. **4** Hydrochloric acid is not a product of muscle contraction; it is present in the stomach to facilitate the digestive process.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Structures and Functions of the Muscular System, Skeletal Muscles

472. **2** Bearing weight on the axillae can cause crutch palsy (muscle weakness or paralysis of the arm and hand caused by pressure on the brachial plexus); weight should be supported by the hands on the cross bars of the crutches.

**1, 3, 4** These are correct techniques when using crutches.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Mobility: Assistive Devices, Nursing Care, Crutch Walking

473. **1** The Romberg test evaluates proprioception. A client is asked to close the eyes when standing. If balance is lost after the client's eyes are closed, a positive Romberg test suggests that there is a sensory cause.

**2** This is a positive Babinski reflex that is indicative of corticospinal pathology in an adult. **3** This is accommodation, a normal finding. **4** This is the oculocephalic or oculovestibular reflex, a normal finding.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

474. Answer: 1, 2, 4.

**1** The medulla, part of the brainstem just above the foramen magnum, is concerned with vital functions such as respirations. **2** The medulla is concerned with vital functions such as the heart rate. **3** This is not controlled by the CNS. **4** The medulla is concerned with vital functions such as blood pressure by controlling blood vessel diameter. **5** This is controlled by the hypothalamus.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Brain

475. **1** The third cranial nerve (oculomotor) contains autonomic fibers that innervate the smooth muscle responsible for constriction of pupils.

**2** The trochlear nerve is concerned with eye movements; lesions result in diplopia, strabismus, and head tilt to the affected side. **3** The optic nerve is concerned with vision; lesions result in visual field defects and loss of visual acuity. **4** The facial nerve is concerned with facial expressions; lesions result in loss of taste and paralysis of the facial muscles and the eyelids (lids remain open).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Neurologic Assessment

476. **1** The facial nerve (seventh cranial) has motor and sensory functions. The motor function is concerned with facial movement, including smiling and pursing the lips. Nonconduction of the facial nerve will cause drooping on the side of the problem.

**2** Nonconduction of the facial nerve on the right side will cause that side of the face to

droop. **3** Nonconduction of the left abducent nerve will prevent abduction of the left eye. **4** Nonconduction of the trigeminal nerve will cause problems in mastication.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Neurologic Assessment

477. **2** Sensory impulses from temperature, touch, and pain travel via the spinothalamic pathway to the thalamus and then to the postcentral gyrus of the parietal lobe, the somatosensory area.

**1** This is the area of abstract thinking and muscular movements. **3** This is the area where nerve impulses are translated into sight. **4** This is the area where nerve impulses are translated into sound.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Brain

478. **4** A Babinski response (dorsiflexion of the first toe and fanning of the other toes) is a reaction to stroking the lateral sole of the foot with a blunt object; it is indicative of damage to the corticospinal tract when seen in adults.

**1** Hyperreflexia is associated with upper motor neuron damage. **2** Increased muscle tone (spasticity) is associated with upper motor neuron damage. **3** This is indicative of hypocalcemia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Traumatic Brain Injuries, Data Base

479. **2** The sympathetic nervous system constricts the smooth muscle of blood vessels in the skin when a person is under stress.

**1** The sympathetic system stimulates, rather than inhibits, secretion by the sweat glands. **3** This is not under sympathetic control; the parasympathetic system constricts the pupils. **4** The parasympathetic system (vagus nerve) slows the pulse, and the sympathetic system increases it.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Autonomic Nervous System

480. **4** The brachial plexus is a maze of nerves extending from the axilla to the neck in the shoulder area; trauma to the arm may injure this plexus.

**1** The solar plexus, also known as the celiac plexus, is where the splanchnic nerves terminate; it is unrelated to the arms. **2** The celiac plexus (solar plexus) is where the splanchnic nerves terminate; it is unrelated to the arms. **3** The basilar plexus is a venous plexus over the basilar part of the occipital bone; it is unrelated to the arms.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Structures and Functions of the Nervous System, Spinal Nerves

481. **4** If there is no obstruction, pressure on the jugular vein causes increased intracranial pressure (Queckenstedt sign). This, in turn, causes an increase in spinal fluid pressure.

**1** Homan sign is calf pain possibly elicited by dorsiflexion of the foot if thrombophlebitis

is present. **2** Romberg sign is failure to maintain balance when the eyes are closed; it indicates cerebellar pathology. **3** Chvostek sign is twitching elicited by tapping the angle of the jaw; it occurs if hypocalcemia is present.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 11, Related Procedures, Lumbar Puncture

482. **2** This is a sign of increasing intracranial pressure, which may follow a craniotomy.

**1, 3** Signs of this will take time to develop; they will not be observable immediately after surgery. **4** The pulse pressure widens with increased intracranial pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Brain Tumors, Nursing Care

483. Answer: 2, 3.

**1** Visual disturbances are not caused by a computed tomography (CT) scan with contrast material. **2** Contrast material precipitates common responses, such as flushing of the face, that indicate sensitivity to the foreign substance. Hypersensitivity reactions (e.g., palpitations, respiratory distress, headache) may occur in some people. **3** Contrast material precipitates common responses, such as a sensation of warmth, that indicate sensitivity to the foreign substance. **4** A salty, not lemony, taste may occur. **5** Petechiae do not result from a computed tomography (CT) scan with contrast material.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Related Procedures, Computed Tomography, Nursing Care

484. **3** An untoward response to the iodinated dye used as a contrast is anaphylaxis. Anaphylaxis is manifested by respiratory distress, hypotension, and shock; counteractive measures must be instituted.

**1** Pelvic or total body warmth is an expected minor side effect. **2** A feeling of warmth or flushing is an expected minor side effect. **4** A salty taste is an expected minor side effect.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Related Procedures Computed Tomography, Nursing Care

485. **3** Therapy must be continued for life to prevent damage to the optic nerve from increased intraocular pressure.

**1** These are used in the treatment of glaucoma; anticholinergics are contraindicated. **2** This is the treatment for cataracts. **4** There is an increase in intraocular pressure with glaucoma; the blood pressure may be unaffected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Glaucoma, Nursing Care

486. **4** The contraction of these muscles permits the lens to return to its normal bulge and decreases focal length, promoting the ability to focus on near objects.

**1** The ciliary muscles are intrinsic (within the eyeball); the third cranial nerve (oculomotor), an extrinsic nerve, controls some movements of the eyelid. **2** The rectus

and oblique muscles of the eye are involved in convergence. 3 Color blindness is an inherited trait.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Sense Organs

487. 4 Glaucoma is a disease in which there is increased intraocular pressure resulting from narrowing of the aqueous outflow channel (canal of Schlemm). This can lead to blindness, caused by compression of the nutritive blood vessels supplying the rods and cones.

1 Pupil dilation increases intraocular pressure because it narrows the canal of Schlemm. 2 Intraocular pressure is not affected by activity of the eye. 3 Although secondary infections are not desirable, the priority is to maintain vision by controlling the pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Glaucoma, Data Base

488. 4 Open-angle glaucoma has an insidious onset, with increased intraocular pressure causing pressure on the retina and blood vessels in the eye. Peripheral vision is decreased as the visual field progressively diminishes.

1 This may occur with untreated acute angle-closure glaucoma. 2 Pain occurs in acute angle-closure, not open-angle, glaucoma. 3 Occlusions of the central retinal artery or retinal detachment will cause a sudden loss of vision.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Glaucoma, Data Base

489. 1 A cataract is a clouding of the crystalline lens or its capsule.

2, 3, 4 This is not the pathophysiology related to cataracts.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Cataract, Data Base

490. 3 Activities such as rigorous brushing of hair and teeth cause increased intraocular pressure and may lead to hemorrhage in the anterior chamber.

1 This is unnecessary; clients are usually permitted to drive before this time. 2 Coughing and deep breathing can increase intraocular pressure and should be avoided. 4 Weakening of the eye musculature is not related to cataracts.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Cataract, Nursing Care

491. 4 Scar formation seals the hole and promotes attachment of the two retinal surfaces.

1 The retina is part of the nervous system; it does not regenerate or grow new cells. 2 The sclera is not involved; the retina adjoins and is nourished by the choroid. 3 This is not the treatment used; treatment includes the formation of a scar by the use of lasers or surgical "buckling."

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Detached Retina, Data Base

492. **3** Conductive hearing loss involves impaired transmission of sound waves to the inner ear so that sound transmitted directly through bone is perceived louder and longer than through air conduction.

**1, 2** Clients with normal hearing or sensorineural deficit perceive air conduction of sound waves louder and longer than bone conduction. **4** The Rinne test is not related to inflammation of the mastoid.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Otosclerosis, Data Base

493. **4** The labyrinth is the inner ear and consists of the vestibule, cochlea, semicircular canals, utricle, saccule, cochlear duct, and membranous semicircular canals. A labyrinthectomy is performed to alleviate the symptom of vertigo but results in deafness, because the organ of Corti and cochlear nerve are located in the inner ear.

**1** There is no pain associated with Ménière syndrome. **2** Ménière syndrome is not related to cerumen production. **3** The loss of the sense of smell (anosmia) is not affected by surgery to the ear.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Ménière Disease, Data Base

494. **2** With a partial hearing loss the auditory ossicles have not yet become fixed; as long as vibrations occur, a hearing aid may be beneficial.

**1** This procedure usually is not performed unless there was total hearing loss or if what was heard was useless. **3** Although the bass tones are particularly affected, all tones are affected. **4** With conduction hearing loss, bone conduction is more effective than air conduction.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Otosclerosis, Data Base

495. **Answer: 3. The score on the GCS ranges from 3 to 15. The client's lack of response earns the minimum of one point in each of the categories: eye opening response, best verbal response, and best motor response.**

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Neurologic Assessment

496. **4** The occipital lobe is involved with visual interpretation.

**1, 3** This is a function associated with the frontal lobe. **2** This is a function associated with the temporal lobe.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Tumors, Data Base

497. **4** The facial nerve may be damaged during surgery. Drooping of the area results from loss of muscle tone.

**1** A tracheostomy is not a complication. **2** This is also called auriculotemporal syndrome; it may follow infection and suppurative of the parotid gland; it is not a surgical

complication. **3** The parotid is a salivary gland; its removal will decrease salivation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 11, Related Procedures, Neurologic Assessment

498. **1** Seizure disorders usually are associated with marked changes in the electrical activity of the cerebral cortex, requiring prolonged or lifelong therapy.

**2** Seizures may occur despite drug therapy; the dosage may need to be adjusted. **3** A therapeutic blood level must be maintained through consistent administration of the drug irrespective of emotional stress. **4** Absence of seizures will probably result from medication effectiveness rather than from correction of the pathophysiologic condition.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 11, Related Pharmacology, Anticonvulsants

499. **2** Phenytoin (Dilantin) is an anticonvulsant most effective in controlling tonic-clonic seizures. Data collection before planning nursing care for a client with a seizure disorder should always include a history of the seizures (e.g., type and incidence).

**1** Although protection is important, the use of restraints and insertion of an object into the mouth during a seizure often cause injury as a result of tonic-clonic muscle contractions and should not be used. **3** Although these may be removed during a seizure, the client's normal routines should be respected. **4** Increased restlessness may be evidence of the prodromal phase of a seizure in some individuals, but signs and symptoms vary so widely that the client's history should be obtained.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Epilepsy, Nursing Care

500. **2** Monitoring of the seizure activity, the body parts involved, the area of its progression, and the length of the episode, as well as the activity of the head and eyes, characteristics of the respiration, and alteration in consciousness provides information that assists in the identification of the type of seizure and, thus, its treatment.

**1** This action is contraindicated. Attempting to insert an oral airway may injure the client and/or the nurse. **3** Turning the client on the side should be done after the tonic-clonic phase of the seizure subsides. **4** This is unnecessary because breathing does not occur during a seizure; this may be done after the seizure.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 11, Epilepsy, Nursing Care

501. **Answer:** 8 mL. Use the "Desire over Have" formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{200 \text{ mg}}{125 \text{ mg}} = \frac{x \text{ mL}}{5 \text{ mL}}$$

$$125 \times = 200 \times 5$$

$$125 \times = 1000$$

$$\times = 1000 \div 125$$

$$\times = 8 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

502. **4** A seizure is generally self-limiting; the nurse's responsibilities include protecting the client from injury and assessing the characteristics of the seizure.

**1** Nothing should be forced into the client's mouth when the teeth are clenched during a seizure; this may damage the teeth or cause an airway occlusion if improperly placed. **2** During a seizure the client loses consciousness and will be unable to discuss any aura experienced. **3** Anticonvulsants are given on a regular basis, not prn, to achieve therapeutic levels.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Epilepsy, Nursing Care

503. **4** To achieve the anticonvulsant effect, therapeutic blood levels must be maintained. If the client is not able to take the prescribed oral preparation, the health care provider should be questioned about alternate routes of administration.

**1** Omission will result in lowered blood levels, possibly to less than the necessary therapeutic level to prevent a seizure. **2** The route of administration cannot be altered without health care provider approval. **3** The client is being kept NPO.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Anticonvulsants

504. **2** The medulla contains the vital respiratory, cardiac, and vasomotor centers.

**1** The pons conducts impulses; it contains reflex centers for cranial nerves V, VI, VII, and VIII (trigeminal, abducent, facial, and vestibulocochlear, respectively). **3** The midbrain is associated with sensory input from the eyes and ears. **4** The thalamus relays sensory impulses to the cerebral cortex.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Brain

505. **4** The eighth cranial nerve has two parts: the vestibular nerve and the cochlear nerve. Sensations of hearing are conducted by the cochlear nerve.

- 1 The frontal lobe is concerned with thinking, skeletal muscle tone, and biorhythms. 2 The occipital lobe is concerned with sight, particularly shape and color. 3 Cranial nerve VI (abducent) is concerned with abduction of the eye.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Neurologic Assessment
506. 3 An unconscious individual loses voluntary control of the sphincters surrounding the urethra and anus.
- 1 This cannot be assumed; hearing is often the last sense to be lost. 2 Motion, although often purposeless, is possible in an unconscious client. 4 Unconscious clients may react to various degrees of pain.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base
507. Answer: 2, 3, 4.
- 1 Although this is part of a neurologic assessment, it is not part of the Glasgow Coma Scale. 2 The scale measures best motor response. 3 The scale measures best verbal response. 4 The scale measures eye opening response. 5 Although this is important to assess, it is not part of the Glasgow Coma Scale.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Neurologic Assessment
508. 1 This action provides reinforcement. It is important to help the client who has expressive aphasia regain maximum communicative abilities as soon as possible. 2 This approach may increase client frustration. 3 Although expectations should be realistic, improvements are possible and should be encouraged. 4 Some abilities do return, and therefore the client should be encouraged to participate.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care
509. 2 The hypothalamus connects with the autonomic area for vasoconstriction, vasodilation, and perspiration and with the somatic centers for shivering; therefore, it is an important area for regulating body temperature.
- 1 The thalamus receives all sensory stimuli, except taste, for transmission to the cerebral cortex; it is also involved with emotions and instinctive activities. 3 The temporal lobe is concerned with auditory stimuli; it may also be involved with the sense of smell. 4 The globus pallidus is part of the basal ganglia; it is also called the pallidum. Together with the putamen, it comprises the lenticular nucleus; it is concerned with muscle tone, which is required for specific body movements.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Structures and Functions of the Nervous System, Brain
510. 1 Head injuries can cause trauma to the brain, and the client should be monitored for symptoms of increased intracranial pressure (e.g., headache, dizziness, and visual

disturbances).

**2** This is not indicated in this situation. **3** Elevating the lower extremities should be avoided because it will increase intracranial pressure. **4** The intracranial pressure may increase after trauma because of bleeding and edema. The temperature may increase because of injury to or pressure on the hypothalamus.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Traumatic Brain Injuries, Nursing Care

511. Answer: 1, 2.

**1** Increased intracranial pressure affects the hypothalamic temperature-regulating center in the brain, resulting in fever. **2** Increased intracranial pressure disrupts neurons and neurotransmitters, which results in faulty impulse transmission and an altered level of consciousness. **3** This is associated with conditions such as pulmonary edema and obstructive airway diseases. **4** Increased intracranial pressure will cause a slow, bounding pulse. **5** The blood pressure increases with a widening pulse pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Tumors, Nursing Care

512. **2** As an osmotic diuretic, mannitol (Osmitrol) helps reduce cerebral edema.

**1, 3** Although there may be a transient increase in blood volume (as a result of an increased osmotic pressure), which increases renal perfusion, this is not the therapeutic effect. **4** This is not the reason for giving this drug.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

513. **4** An increase in intracranial pressure causes impaired cerebral blood flow affecting the cells of the cerebral cortex and the reticular activating system (area that helps maintain wakefulness), which result in a decreased level of consciousness.

**1** As the intracranial pressure increases, it places pressure on the thalamus, hypothalamus, pons, and medulla, resulting in a full, bounding, slow pulse. **2** A widening pulse pressure occurs due to an increase in the systolic pressure. **3** As the intracranial pressure increases, it places pressure on the thalamus, hypothalamus, pons, and medulla, resulting in irregular respirations that progress to deep, rapid breathing alternating with periods of apnea (Cheyne-Stokes respirations).

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Brain Tumors, Nursing Care

514. **1** Increased intracranial pressure from bleeding into and swelling of tissues within the cranium results in a slowing of the heart rate.

**2** Carotid circulation is not altered. **3** This does not occur in this situation. **4** Spinal reflexes generally remain intact.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Tumors, Nursing Care

515. **4** Residual blood from the ruptured aneurysm may have blocked the arachnoid villi, interrupting the flow of CSF, resulting in hydrocephalus.

**1** Vasospasm is a protective response during the active bleeding process; it does not

cause hydrocephalus. **2** The Broca center is not directly affected; even if it were, there is no relationship to the development of hydrocephalus. **3** The production of cerebrospinal fluid is not increased in this situation; increased production may result when there is a tumor of the choroid plexus.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 11, Traumatic Brain Injuries, Data Base

516. **4** This is a sign of increasing intracranial pressure, which may occur after a craniotomy.

**1** Bradycardia, not tachycardia, may occur. **2** The pupils will dilate, not constrict. **3** The systolic, not the diastolic, pressure may be elevated.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 11, Brain Tumors, Nursing Care

517. **1** A stroke in the left hemisphere will lead to a loss of the right visual field of each eye; objects should be placed within the client's view.

**2, 3, 4** These actions are not related to hemianopsia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

518. **1** This client is in stage 3 hypertension and needs immediate medical intervention.

**2** Exercise would not have increased the blood pressure to this level. **3** The "white coat syndrome" would not increase the blood pressure to this level. **4** This will delay obtaining emergency care; the client needs medical care regardless of what medications are being taken.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

519. **4** Transient ischemic attacks (TIAs) are temporary neurologic deficits related to cerebral hypoxia; about one third of the people who have TIAs will have a CVA within 2 to 5 years.

**1, 2, 3** This is not a risk factor associated with a brain attack (CVA).

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

520. **3** Bleeding into the enclosed cavity of the skull creates pressure, causing pain.

**1** Seizures are not directly related to the hemorrhage; they result from abnormal electrical charges that may eventually develop as a consequence of tissue ischemia. **2** Decerebrate posturing (extension posturing) indicates caudal deterioration with damage to the midbrain and pons. **4** As the systolic pressure increases, widening of the pulse pressure occurs because of compression of vasomotor centers.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 11, Review of Anatomy & Physiology Review of Physical Principles

521. **3** A comatose client loses voluntary control of elimination.

**1** Although these may occur, they are not the most common responses associated with brain attack and coma. **2** Because cerebral functioning is depressed, purposeful or voluntary movement is absent. **4** Because there are different levels of coma, the individual may or may not respond to intense stimuli such as pain.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

522. **2** Absence of a gag reflex is common after a brain attack. To prevent aspiration, the client is positioned on the side to allow gravity to drain mucus in the nasopharyngeal area away from the trachea.

**1** Chest expansion is hindered in the prone position. **3** This position allows the tongue to occlude the airway and encourages the aspiration of secretions if the gag reflex is not intact. **4** This position interferes with respiration and leads to increased intracranial pressure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

523. **1** Emotional lability is associated with brain trauma from ischemia or injury. The frontal lobe, hypothalamus, thalamus, and cortical limbic system are involved in expression of emotions.

**2** Emotional lability is not limited to interactions with family. **3** While the client may be depressed, the uncontrollable tearfulness is due to the disease process. **4** While nonverbal messages are often helpful in determining emotional response, these emotional outbursts may be unrelated to feelings.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident; Data Base

524. **3** Dysphagia is difficulty in swallowing.

**1, 2, 4** This is unrelated to dysphagia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

525. **4** Clients with dysarthria have difficulty communicating verbally, and an alternate means of communication may be indicated.

**1, 2, 3** This is an important aspect of care, but it is not related to dysarthria.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

526. **1** The paralyzed side has decreased muscle tone, which may lower blood pressure readings.

**2** The return of function to the affected extremity is not influenced by taking the blood pressure; restoration of function occurs because of resolution of inflammation or resorption of blood in the area of the infarct. **3** Taking the blood pressure will not

precipitate the formation of thrombi. **4** Although the brachial artery will be compressed when taking a blood pressure reading, it will not cause circulatory impairment because the pressure is temporary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

527. **1** Passive range-of-motion exercises prevent the development of deformities (e.g., contractures) and do not require any energy expenditure by the client. Instituting range-of-motion exercises is an independent nursing function.

**2, 3, 4** Bed rest is prescribed to decrease oxygen demands; active exercises markedly increase oxygen consumption.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

528. Answer: 3, 4.

**1** Edema is a sign of fluid volume excess, not urinary retention. **2** Oliguria (urinary output less than 500 mL/day) is a sign of kidney failure. With retention, the total amount of urine produced is unaffected. **3** Atony permits the bladder to fill without being able to empty. As pressure builds within the bladder, the urge to void occurs, and just enough urine is eliminated to relieve the pressure and the urge to void. The cycle is repeated as pressure again builds. Thus, small amounts are voided without emptying the bladder. **4** As urine is retained and the bladder enlarges, it causes suprapubic distention. **5** Continual incontinence does not occur with urinary retention.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

529. **3** To prevent contractures after a brain attack, the client should be positioned in functional alignment and passive range-of-motion exercises should be performed.

**1** Active exercises are impossible with paralyzed limbs. **2** The health care provider must request a consult with the physical therapist. **4** This will increase contractures and atrophy.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

530. **1** Various types of splints or boots are available to keep the foot in a position of functional alignment.

**2** Blocks elevate the frame of the bed and have no effect on the position of the feet. **3** Although a cradle will keep the pressure of the linen off the client's feet, which otherwise may promote footdrop, the cradle does not maintain functional alignment of the ankle. **4** Sandbags help prevent rotation of an extremity or the head; they are not used to prevent footdrop.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident,

## Nursing Care

531. **1** Change of position at least every 1 or 2 hours helps prevent the respiratory, urinary, and cutaneous complications of immobility.

**2** Too protracted a period of time in one position increases the potential for respiratory, urinary, and neuromuscular impairment; prolonged physical pressure increases the possibility of skin breakdown. **3, 4** This is an unnecessarily short time interval; too frequent repositioning may interfere with the client's rest.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

532. **1** Hemiparesis creates instability. Using a cane provides a wider base of support and, therefore, greater stability.

**2** Hemiparesis affects muscle strength on one side of the body; the joints are not directly affected. **3** Activity should strengthen, not injure, weakened muscles. **4** The use of a cane will not prevent involuntary movements if they are present.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

533. **3** Because stomach distention after eating results in contractions of the colon (gastrocolic reflex), which promotes defecation, establishing some regularity of meals that include adequate bulk or fiber will help establish routine patterns of defecation.

**1, 2** Although this facilitates elimination, in general it does not help establish a pattern of defecation. **4** Increased potassium is not needed for normal elimination.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

534. **4** As part of the rehabilitative process after a brain attack, clients should be encouraged to participate in their own care to the extent that they are able and to extend their abilities by establishing short-term goals.

**1** A client with a brain attack may or may not have dysphagia; altering the consistency of food without the need to do so may make it less palatable. **2** Making the client feel helpless discourages independence. **3** This is unrealistic; family members may not be available because of other responsibilities.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

535. **2** Bowel training is a program for the development of a conditioned reflex that controls regular emptying of the bowel. The key to success is adherence to a strict time for evacuation based on the client's individual schedule.

**1** The indiscriminate use of laxatives can result in dependency. **3** Although this should be considered, the brain attack affects the responses of the client by altering motility, peristalsis, and sphincter control despite adherence to previous habits. **4** The passage of food into the stomach does stimulate peristalsis, but it is only one factor that should

be considered when planning a specific time for evacuation.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

536. **2** A full rectum may exert pressure on the urinary bladder, which may precipitate urinary incontinence.

**1** Urinary retention catheters should not be used to manage urinary incontinence initially. The use of a catheter keeps the bladder empty, which promotes atony and incontinence. **3** Caffeine acts as a diuretic and is a urinary bladder irritant; both promote urinary incontinence. **4** Carbonated beverages irritate the urinary bladder, which promotes urinary incontinence.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

537. **4** To foster communication and cooperation, family members should be involved in planning and implementing care.

**1** This intervention does not focus on feelings or needs. **2** The spouse may promote dependency in the client to satisfy a need to control. **3** Although true, the family should be involved.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

538. **2** Changes in self-image and family role can initiate a grieving process with a variety of emotional responses.

**1, 3, 4** This cannot be assumed; the client's feelings need to be elicited.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack, Nursing Care

539. **1** Damage to the Broca area, located in the posterior frontal region of the dominant hemisphere, causes problems in the motor aspect of speech.

**2, 3, 4** This is associated with receptive aphasia, not expressive aphasia; receptive aphasia is associated with disease of the Wernicke area of the brain.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Data Base

540. **1** Clients with expressive aphasia must be encouraged to associate words with objects so that communication is regained.

**2** Speech usually can be improved through therapy. **3** This may cause frustration. A balance must be achieved between assisting the client to communicate and permitting time for the client to form thoughts and words independently. **4** Despite having difficulty speaking, individuals with expressive aphasia can understand what is said to them.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 11, Brain Attack/Cerebrovascular Accident, Nursing Care

541. 1 Pain may prevent the client from ingesting anything by mouth.

2 Facial exercises may precipitate an attack. 3 Hot or cold foods or compresses should be avoided because they may trigger a painful attack. 4 This may initiate an acute attack of trigeminal neuralgia; often clients must limit oral hygiene to rinsing the mouth.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 11, Trigeminal Neuralgia, Nursing Care

542. Answer: 2, 3.

1 Petechiae are minute subcutaneous hemorrhages; they are not present in this disorder. 2 Tic douloureux, also referred to as trigeminal neuralgia, is an inflammation of the fifth cranial (trigeminal) nerve, which innervates the midline of the face and head. 3 Tic douloureux is an inflammation of the fifth cranial nerve that innervates the midline of the face and head, which includes the mouth. 4 Pain, not weakness, occurs in this disease. Impairment of facial muscles occurs with Bell palsy. 5 The third (oculomotor), not fifth, cranial nerve innervates the eyelid.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 11, Trigeminal Neuralgia, Data Base

543. 1 The nurse should avoid walking swiftly past the client because drafts or even slight air currents can initiate pain.

2 The client may assume any position of comfort, but pressure on the face while in the prone position may trigger an attack. 3 Although the procedure for oral hygiene may be modified, it is not discontinued. 4 Massaging may trigger an attack and should be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 11, Trigeminal Neuralgia, Nursing Care

544. 4 Carbamazepine (Tegretol) is a nonnarcotic analgesic, anticonvulsant drug used to control pain in trigeminal neuralgia and to prevent future attacks. It sometimes eliminates the need for surgery.

1 Ascorbic acid (vitamin C) may be used as an adjunct to the specific treatment for trigeminal neuralgia. Vitamin C is prescribed when the body is subject to stress, as occurs with pain. 2 Morphine sulfate is an opioid analgesic that will relieve severe pain but will not prevent its recurrence; prolonged frequent use is contraindicated because of possible addiction. 3 Allopurinol (Zyloprim) is used in the treatment of gout.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Trigeminal Neuralgia, Data Base

545. Answer: 3, 5.

1 Because clients are apprehensive and have pain, prolonged periods of sleep usually do not occur. 2 Pain medications do not normally cause hyperactivity. 3 Severe, constant pain; emotional stress; muscle tensing; and diminished nutritional intake can lead to exhaustion and fatigue. 4 The client may be very quiet for fear of precipitating an attack. 5 The movements associated with chewing and swallowing may precipitate a

painful attack.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Trigeminal Neuralgia, Data Base

546. 4 The client may be able to avoid stimulating the involved trigeminal nerve and thus prevent pain by chewing on the unaffected side.

1 Food and fluids that are too hot or too cold can precipitate pain. 2 Although oral hygiene may initiate pain, it cannot be avoided. It can be modified to include rinsing the mouth or using a soft swab instead of a toothbrush. 3 Warm compresses may precipitate pain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Trigeminal Neuralgia, Nursing Care

547. 3 Bell's palsy unilaterally affects the seventh cranial nerve, which innervates the face; the blink reflex is diminished, so corneal damage must be prevented.

1, 2, 4 This is not necessary because Bell palsy involves the seventh cranial nerve, which innervates the facial muscles.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Bell's Palsy, Nursing Care

548. Answer: 1, 4, 3, 5, 2.

1 Self-esteem is a primary concern of adolescents, who are experiencing the developmental stage of identity versus role confusion. 4 Paralysis of one side of the face affects the ability to speak clearly; communication is essential, particularly with peers. 3 Paralysis of one side of the face affects the ability to chew; nutrition is a basic need. 5 Food particles tend to be retained on the affected side of the oral cavity because of impaired mastication. Oral hygiene helps prevent this occurrence. 2 Falling should not be a problem; the client is capable of seeing clearly with the unaffected eye.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Bell's Palsy, Nursing Care

549. Answer: 1, 4.

1 Diplopia (double vision) and nystagmus (involuntary, rapid, rhythmic eye movements) are experienced by clients with multiple sclerosis as a result of demyelination. 2 Clients experience intention, not resting, tremors. 3 Clients experience spastic paralysis because upper motoneurons are involved. 4 Scanning (clipped) speech occurs with multiple sclerosis as a result of demyelination. These clients exhibit the Charcot triad: intention tremor, nystagmus, and scanning speech. 5 Although emotional affect and speech are affected, intelligence remains intact.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Multiple Sclerosis, Data Base

550. 2 This tends to increase symptoms and may result in burns because of decreased sensation.

1 Using a straw gives the client more control of liquid intake, preventing aspiration. 3 Although a bladder regimen to maintain control is preferable, the use of

pads can avoid embarrassment. **4** The disease does have periods of remission and exacerbation.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Multiple Sclerosis, Nursing Care

551. **2** Spacing activities will encourage maximum functioning within the limits of strength and fatigue.

**1** Bed rest and limited activity may lead to muscle atrophy and calcium depletion. **3** Strengths, rather than limitations, should be stressed. **4** This is unnecessary. It is nursing's responsibility to maintain client safety and meet client needs.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Multiple Sclerosis, Nursing Care

552. **4** The classic feature of Guillain-Barré syndrome is ascending weakness, beginning in the lower extremities and progressing to the trunk, upper extremities, and face; more frequent assessment, especially of respiratory status, is needed.

**1** Localized seizures are not a characteristic of Guillain-Barré syndrome. **2** Skin desquamation is not a characteristic of Guillain-Barré syndrome. **3** Deep tendon reflexes are absent with Guillain-Barré syndrome.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Guillain-Barré Syndrome, Data Base

553. **3** As a result of muscle weakness, the vital capacity is reduced, leading to increased risk of respiratory complications; impaired swallowing can also lead to aspiration.

**1** Although ALS is progressive, clients with myasthenia gravis may be stable with treatment, and clients with Guillain-Barré syndrome may experience a complete recovery. **2** None of these diseases are caused by a lack of neurotransmitters; only myasthenia gravis is associated with a decreased number of receptor sites. **4** Twitching is not expected with myasthenia gravis or Guillain-Barré syndrome.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Myasthenia Gravis, Data Base

554. **2** A patent airway is the priority. The client does not have the ability to deep breathe and cough.

**1** This assessment takes time and delays an intervention that will maintain an open airway. **3** This will take time and delay an intervention that will maintain an open airway. Oxygen administration will be useless if the airway is not patent. **4** This position is unsafe for a client with Guillain-Barré syndrome. The client will be unable to maintain this position. Muscle weakness involves the lower extremities, progressing to the upper extremities and diaphragm.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Guillain-Barré Syndrome, Nursing Care

555. **2** Guillain-Barré syndrome is a progressive paralysis beginning with the lower extremities and moving upward; mechanical ventilation may be required when respiratory muscles are affected.

**1** The use of a straw would not be an effective stimulant for the facial muscles; oral intake may be contraindicated depending on the extent of the paralysis because of the risk for aspiration. **3** With progressive paralysis, the client will not be able to perform aerobic exercises. **4** Antibiotics are not given prophylactically; antibiotics will not help if pneumonia is caused by etiologies that are not bacterial.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 11, Guillain-Barré Syndrome, Nursing Care

556. **4** Clients with amyotrophic lateral sclerosis (ALS) have difficulty managing saliva; the sitting position helps prevent aspiration; also, it keeps the food in the stomach via gravity and limits the pressure of the abdominal organs against the stomach, both of which prevent regurgitation and aspiration.

**1, 3** This position increases the risk of regurgitation and aspiration because of the pressure of the abdominal organs against the stomach. **2** This position is too upright for a client with ALS to remain comfortable and safe.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 11, Amyotrophic Lateral Sclerosis, Nursing Care

557. Answer: 1, 4.

**1** Spacing activities throughout the day is a strategy to help conserve the client's energy. **2** Large groups should be avoided to limit the risk of infection; respiratory complications are the leading cause of death. **3** Opioids are not used because they may depress respirations. Lower extremity pain usually is not a problem associated with ALS. **4** Alternate ways to communicate (e.g., writing, electronic devices) should be used when speech becomes difficult because of muscle weakness. **5** Braces and splints, not restraints, may be used.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 11, Amyotrophic Lateral Sclerosis, Nursing Care

558. **1** Dysphagia may lead to aspiration, which can cause pneumonia, interfering with gas exchange and posing a threat to life.

**2, 3** While nutrition and fluid intake will be adversely affected by dysphagia, these problems are not the priority. **4** Dysphagia is difficulty swallowing and does not affect communication.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 11, Myasthenia Gravis, Data Base

559. **3** One of the pathologic changes is electron microscopic evidence of fewer AChR sites; also, antibodies cause destruction and blockade at the AChR sites.

**1** There is no genetic defect in the production of ACh; rather than a genetic cause, it is thought that myasthenia gravis has an autoimmune etiology. **2** Although the defect is at the neuromuscular junction, it is not an inefficiency in the use of ACh but a decrease in the number of receptor sites for ACh. **4** AChE is inhibited by anticholinesterase drugs used to treat myasthenia gravis, leaving more ACh available to the damaged or decreased ACh receptors.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Myasthenia Gravis, Data Base

560. 3 Myasthenia gravis is a chronic disorder with exacerbations that are precipitated by emotional stress, ingestion of alcohol, and physiologic stress such as infection.

1 There is no cure for myasthenia gravis. 2 The disease is characterized by exacerbations and remissions. 4 The disease is chronic. Death does not occur within a short period but usually after the muscles of respiration are affected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Myasthenia Gravis, Data Base

561. 2 Raising the head of the bed allows gravity to assist in the swallowing of saliva, thus decreasing the risk for aspiration.

1 Oxygen will not assist in the management of dysphagia or the prevention of aspiration. 3 This may become necessary if the upright position does not allow the client to manage secretions. 4 Alerting the health care provider to the problem is necessary, but only after client safety is ensured.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Myasthenia Gravis, Nursing Care

562. 3 Weakened muscles result in ineffective coughing; secretions are retained and provide a medium for bacterial growth.

1 The airways are not narrowed. 2 Immune mechanisms are not impaired directly. 4 Viscosity of secretions depends on fluid intake and humidity.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Myasthenia Gravis, Data Base

563. 2 Neostigmine (Prostigmin), an anticholinesterase, inhibits the breakdown of ACh, thus prolonging neurotransmission.

1 Neostigmine's action is at the myoneural junction, not the cerebral cortex. 3 Neostigmine prevents neurotransmitter breakdown but is not a neurotransmitter. 4 Neostigmine's action is at the myoneural junction, not the sheath.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Cholinesterase Inhibitors

564. 1 Edrophonium (Enlon) improves muscle strength in myasthenic crisis; weakness persists if symptoms are caused by cholinergic crisis, which can result from toxic levels of neostigmine (Prostigmin).

2 Edrophonium is not used for synergistic effects; the duration of effect is brief. 3 This is the same type of drug as neostigmine; no resistance is indicated. 4 The diagnosis is already established and treatment initiated.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Cholinesterase Inhibitors

565. 4 Parkinson disease involves destruction of the neurons of the substantia nigra,

caudate nucleus, and globus pallidus of the basal ganglia. The cause of this destruction is unknown.

**1** This pathologic condition is associated with multiple sclerosis. **2** This condition results in auditory and visual problems; it is not associated with Parkinson disease. **3** This condition is associated with myasthenia gravis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Parkinson Disease, Data Base

566. **2** The onset of this disease is not sudden, but insidious, with a prolonged course and gradual progression.

**1, 3** The onset is slow and gradual. **4** The onset is not irregular; there is a gradual, regular progression of symptoms.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Parkinson Disease, Data Base

567. **3** This is the best response to the client's question. The client with this disease cannot execute automatic involuntary movements and has difficulty swallowing saliva.

**1** It is known that bradykinesia and muscular weakness cause difficulty in swallowing saliva. **2** There is no true paralysis or loss of sensation with this disease. **4** Muscular rigidity occurs with this disease, but it is not the cause of drooling.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Parkinson Disease, Data Base

568. Answer: 1, 2, 5.

**1** Resting (nonintention) tremors, commonly accompanied by pill-rolling movements of the thumb against the fingers, is associated with destruction of the neurons of the basal ganglia and substantia nigra. **2** Destruction of the neurons of the basal ganglia and substantia nigra results in decreased muscle tone. The masklike appearance, unblinking eyes, and monotonous speech patterns can be interpreted as a flat affect. **3** Muscle flaccidity is not associated with Parkinson disease. Rigidity is caused by sustained muscle contractions. Movement is jerky in quality (cogwheel rigidity). **4** Tonic-clonic seizures are not associated with Parkinson's disease. **5** Slow, voluntary movements (bradykinesia) are associated with this disorder.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Parkinson Disease, Data Base

569. **1** The client with Parkinson disease often has a stooped posture because of the tendency of the head and neck to be drawn down; this shift away from the center of gravity causes instability.

**2** Hesitation is part of the disease; clients may use a marching rhythm to help maintain a more fluid gait. **3** The tremors of Parkinson disease occur at rest (resting tremors). **4** The client must consciously attempt to maintain a natural arm swing for balance.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

**Ch 11, Parkinson Disease, Nursing Care**

570. **4** Carbidopa-levodopa (Sinemet) is used because levodopa is the precursor of dopamine. It is converted to dopamine in the brain cells, where it is stored until needed by axon terminals; it functions as a neurotransmitter.

**1, 3** This is not an action of this drug. **2** This is not an action of this drug; neurons do not regenerate.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** **Ch 11**, Related Pharmacology, Antiparkinson Agents

571. **1** Because of pressure on the sciatic nerve, pain radiating to the hip and leg is common.

**2, 4** This is not associated with this disorder. **3** Although weakness (paresis) may occur, paralysis is not common.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** **Ch 11**, Degenerative Disk Disease, Data Base

572. Answer: **1, 5**.

**1** These actions, as well as lifting and straining, cause an increase in the intraspinal pressure, resulting in pain. **2** This does not affect the intraspinal pressure and should not cause pain. **3** Although pain may increase as a result of compression of the vertebrae, the increase is gradual, not sudden. **4** Flexing the knees and hips relieves intraspinal pressure and pain. **5** Straining when having a bowel movement increases intraspinal pressure, causing pain.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** **Ch 11**, Degenerative Disk Disease, Nursing Care

573. **2** Inflammation from the trauma of intravertebral disk surgery may lead to injury of the nerve root, with consequent motor or sensory dysfunction.

**1** Cerebral edema does not occur. **3** Rather than spasticity, urinary retention may develop if pressure on the nerve root occurs as a result of edema or bleeding. **4** Pain usually is experienced at the operative site and in the legs as a result of edema around the cord.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** **Ch 11**, Degenerative Disk Disease, Nursing Care

574. **2** Log-rolling maintains the alignment of the vertebral column.

**1** Coughing will increase the pressure of the CSF surrounding the spinal cord and intensify the pain; incentive spirometry and turning should be used to prevent respiratory complications. **3** Peritonitis is not a danger because the abdominal cavity was not opened. **4** Flexion of the knees is avoided postoperatively because it alters intervertebral pressure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** **Ch 11**, Degenerative Disk Disease, Nursing Care

575. **1** Increased oral secretions and a sore throat that limits the ability to cough are expected responses after a cervical laminectomy.

- 2 Flexion of the head is avoided to prevent strain on the operative site. 3 The head of the bed may be only slightly elevated or to a level of comfort after a cervical laminectomy. 4 Limited range of motion should be done after both operations.
- Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Degenerative Disk Disease, Nursing Care
576. 1 The individual should be moved only with a backboard to avoid additional spinal cord damage. Moving a person whose spinal cord has been injured may cause irreversible paralysis.
- 2 A back injury precludes changing the person's position. 3 A back injury is suspected; therefore, the person should not be moved. 4 A flat board is indicated; however, one rescuer should not move the person without help.
- Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care
577. 1 Both legs and generally the lower part of the body are paralyzed in paraplegia. 2 There is no term to describe this condition; all parts below an injury are affected. 3 This is hemiplegia. 4 This is quadriplegia.
- Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Data Base
578. 1 Because of the location of the micturition reflex center (in the sacral region of the spinal cord), bladder function may be impaired with lower spinal cord injuries. 2 This client's ability to ingest, digest, or metabolize food is not affected; therefore, nutrition is less of a problem than bladder control. 3 These exercises require motor control, which the client does not have. 4 Because there is no voluntary control over the lower extremities, mobility usually is accomplished through the use of a wheelchair rather than ambulation.
- Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Spinal Cord Injury, Data Base
579. 4 Correct positioning maintains functional alignment, which helps prevent contracture formation.
- 1 Deep massage may dislodge thrombi that have formed as a result of venous stasis. 2 Active exercises are not possible because the client is paralyzed. 3 The tilt board is used primarily to prevent orthostatic hypotension or bone demineralization.
- Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care
580. 2 Pressure ulcers easily develop when a particular position is maintained; the body weight, directed continuously in one region, restricts circulation and results in tissue necrosis.
- 1 Clients often state that they are comfortable and wish to remain in one position. 3 Proper positioning with supportive devices and range of motion are more effective measures to prevent contractures. 4 Because turning usually is done laterally, the circulation to the lower extremities is not dramatically affected.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

581. **4** Clients in the early stages of spinal cord damage experience an atonic bladder, which is characterized by the absence of muscle tone, an enlarged capacity, no feeling of discomfort with distention, and overflow with a large residual. This leads to urinary stasis and infection. High fluid intake limits urinary stasis and infection by diluting the urine and increasing urinary output.

**1** Dehydration is not a major problem after spinal cord injury. **2** Pressure-relieving devices and position changes are most essential in preventing skin breakdown. **3** An electrolyte imbalance is not a major problem after spinal cord injury.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

582. Answer: 3, 5.

**1** This occurs after spinal shock has subsided. **2** During the acute phase, retention of urine and feces occurs as a result of decreased tone of the bladder and bowel; thus, incontinence is unusual. **3** Spinal shock (spinal shock syndrome) is immediate after a transection of the spinal cord; it results in flaccid paralysis of all skeletal muscles and usually lasts for 48 hours, but may persist for several weeks. **4** Respirations are labored, but spontaneous breathing continues, indicating that the level of injury is below C4 and respirations are not affected. **5** Spinal shock is caused by transection of the spinal cord and results in a loss of reflex activity below the level of the injury.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Spinal Cord Injury, Data Base

583. **3** Muscles are flaccid during spinal shock but develop spasticity with recovery; these movements are entirely involuntary.

**1** Once nervous tissue is transected, it does not regenerate, and paralysis therefore remains. **2** Although edema may be subsiding, motor function will not return if the cord is transected; paralysis remains below the level of the injury. **4** Although thrombophlebitis may occur, the client will not have any sensation of pain.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Data Base

584. **1** These are symptoms of autonomic dysreflexia, which commonly are precipitated by a distended bladder.

**2, 3** These are not associated with the symptoms of autonomic dysreflexia. **4** The blood pressure increases suddenly with autonomic dysreflexia.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Spinal Cord Injury, Data Base

585. **4** During prolonged inactivity, bone resorption proceeds faster than bone formation, and lack of therapeutic weight-bearing on bone results in demineralization. A tilt table provides gradual progressive weight-bearing, which counters these effects.

**1** Lateral turning is possible and necessary if a client is immobile, but a tilt table does not make this possible. **2** The tilt table is used for scheduled periods in physical therapy.

The nursing care required to prevent pressure ulcers must be consistently performed frequently throughout the day and night. **3** The tilt table does not cause hyperextension of the spine; the spine remains in functional body alignment.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

586. **1** Clients with quadriplegia do not have the muscle innervation, strength, or balance needed for ambulation.

**2** Bracing and crutch-walking require muscle strength and coordination that an individual with quadriplegia does not have. **3** Orthostatic hypotension can be prevented by a gradual assumption of the upright position and does not necessarily require a wheelchair. **4** Quadriplegia refers to paralysis of all four extremities.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Data Base

587. **3** Regional analgesia uses a local anesthetic to control pain; the local effect avoids systemic reactions.

**1** The dose adjustment involves the same level of complexity as conventional methods. **2** The hip replacement involves somatic, not neuropathic, pain. **4** Parenteral medication is used in conjunction with regional analgesia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

588. **4** Handling the cast with fingertips before it is dried may create indentations that can cause pressure.

**1** Elevating the casted extremity on a pillow will help reduce edema. **2, 3** This will increase air flow that facilitates drying of the cast.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fractures of the Extremities, Nursing Care

589. **Answer: 2 tablets.** First convert 0.6 mg to its equivalent in mcg by multiplying by 1000 (move the decimal 3 places to the right). Use the “Desired over Have” formula of ratio and proportion to answer the question.

$$\frac{\text{Desire } 1200 \text{ mcg}}{\text{Have } 600 \text{ mcg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$600 x = 1200$$

$$x = 1200 \div 600$$

$$x = 2 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

590. **3** Allopurinol (Zyloprim) interferes with the final steps in uric acid formation by inhibiting the production of xanthine oxidase.

**1** This drug prevents the formation of uric acid; it does not affect bone density. **2** Allopurinol has no effect on swelling of the synovial membranes. **4** This medication prevents the synthesis of uric acid, not its crystallization.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Antigout Agents

591. **2** Colchicine (Colsalide) decreases the formation of lactic acid, which may promote the deposition of uric acid in the joints. It also decreases the inflammatory response.

**1** Ibuprofen (Motrin) is a nonsteroidal antiinflammatory agent; it does not prevent the formation of uric acid. **3** Probenecid (Benemid) acts to inhibit the resorption of urate in the kidneys and therefore decreases uric acid in the blood; it is not useful in the treatment of acute gout but rather of chronic gout. **4** Hydrocortisone (Cortef) is an antiinflammatory agent; it is not used to treat gout.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Antigout Agents

592. Answer: 2, 5.

**1** Eggs have insignificant amounts of purine and are unrestricted. **2** Like other organ meats, liver is a high-purine food (range of 150 to 1000 mg/100 g) and should be avoided. **3** Cheese has insignificant amounts of purine and is unrestricted. **4** Foods that contain a moderate amount of purine (50 to 150 mg/dL), such as salmon, may be eaten four times a week. **5** Shellfish (e.g., shrimp, lobster) are high-purine foods and should be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

593. **4** Warm compresses (at or slightly above body temperature) dilate blood vessels, increasing blood flow to the area and decreasing edema.

**1, 2, 3** This temperature is too cool to increase blood flow to the area.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

594. **2** Elevated tissue pressure restricts blood flow, causing increasing ischemia and

increasing pain; it is the cardinal early symptom of compartment syndrome.

**1** The arm will feel cool, not warm, because of a decrease in circulation. **3** Sluggish, not rapid, capillary refill is a sign of compartment syndrome. **4** The pulse will be diminished, not bounding; increasing edema impairs circulation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Fractures of the Extremities, Nursing Care

595. **1** This is not a priority at this point. The client is too traumatized to learn. It will assume priority as the client's recovery progresses.

**2** The nurse must closely monitor the hemoglobin level because blood loss is a major problem **3** Maintaining a pressure dressing helps to prevent edema and bleeding and to shape the residual limb for a prosthesis. **4** The client has experienced a major life event; the nurse will need to be empathetic and use interviewing skills to encourage expression of feelings.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

596. **3** The hips are in extension when the client is prone; this keeps the hips from flexing.

**1** In the left side-lying position the right hip will be flexed, promoting contracture formation. **2** This promotes flexion contracture formation. **4** This is not related to the prevention of hip-flexion contractures.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

597. **3** Elastic bandages compress the residual limb, preventing edema and promoting residual limb shrinkage and molding; the bandage must be rewrapped when it loosens.

**1, 2** This has a systemic effect on fluid balance; edema of the residual limb is a localized response to inflammation. **4** Prolonged elevation of the residual extremity can lead to a flexion contracture of the hip.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

598. **2** Preparing muscles that will do the work in crutch-walking (e.g., triceps, finger flexors, wrist extensors, and elbow extensors) is imperative.

**1** The biceps are not the major muscles required for crutch-walking. **3** Contractures of the limb will not have a great influence on the ability to use crutches. **4** Strengthening the hamstring muscles will not assist in the use of crutches.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

599. **3** Flexion contracture of the hip can be prevented by routinely placing the client in a prone position to extend the hip.

**1, 2** This can cause flexion of the hip, which will result in a hip contracture. **4** Lying in this position does not allow for full extension of the hip.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

600. Answer: 2, 4.

**1** Flushing of the face is not a classic sign of pulmonary embolus. **2** Unilateral chest pain is caused by decreased oxygenation to pulmonary tissues. **3** A fever is not a classic sign of pulmonary embolus. **4** Because capillary perfusion is blocked by the pulmonary embolus, oxygen saturation drops and the client experiences shortness of breath, dyspnea, and tachypnea. **5** The pain associated with pulmonary embolus generally is sudden in onset, severe, and located in the chest, not the hip.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

601. **1** This position offsets the development of hip deformities resulting from contractures. It also maintains the correct center of gravity when the client is upright.

**2** This promotes flexion contracture of the hip. **3** This may alter the center of gravity and cause a loss of balance. **4** A prosthesis may be applied early in the postoperative period but requires a rigid dressing (cast) to prevent edema; ambulation can be facilitated by the use of a walker, crutches, parallel bars, or a cane.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

602. **1** A continuous passive motion device is most commonly used after knee replacement to gradually increase knee flexion without weight-bearing or strain.

**2** Because it provides passive range of motion, muscle tone is not affected. **3** A continuous passive motion device is not used to prevent tissue breakdown. **4** Since muscles are not contracting, venous stasis is not prevented.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Related Procedures, Continuous Passive Motion Device

603. **1** Rehabilitation should begin immediately. This includes preoperative discussion of the nature of the operation and rehabilitation techniques.

**2, 3, 4** This is too late; valuable rehabilitation time has been wasted.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

604. **2** The neural endings that innervated the limb are still intact and may be stimulated (e.g., touch, environmental temperature, barometric pressure changes) within the residual limb.

**1** Severed blood vessels are not involved in phantom limb sensation. **3** Although an individual must grieve over a lost body part, the grieving is unrelated to phantom limb sensation. **4** Although phantom limb sensation is a hallucinatory-type experience, it is not part of a psychotic process.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Amputation, Nursing Care

605. **2** A four-point gait provides for weight-bearing on all points that touch the floor and maximum support during ambulation.

**1, 3** A three-point gait is used when one extremity cannot bear weight. **4** A swing-through gait does not simulate ambulation; it is used when the individual can bear weight but lacks the muscular control needed for ambulation without an assistive device.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

606. **2** Information about the client's experiential background will influence the teaching plan. A teaching plan should be formulated based on what a client does or does not know.

**1** This may be done later. Also, the swing-through gait may be used initially. **3** This may or may not be done later. The focus should be on the client at this time. **4** This should eventually be done but is not the priority at this time.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

607. **3** In the four-point gait the client brings the left crutch forward first, followed by the right foot; then the right crutch is brought forward, followed by the left foot. Thus, both legs must be able to bear some weight.

**1** Although the arms are extended to allow the hands to bear weight, the elbows are not maintained in this position. **2** Pressure on the axillae may damage nerves in the area. **4** Both extremities must be able to bear weight.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

608. **1** This response explains why the traction may not be released; a continuous pull must be maintained.

**2** Reducing the weight requires a health care provider's order; removing half the weights will not maintain the bone in alignment. **3** This ignores the client's request to release the traction; further assessment is needed. **4** Although this is a true statement, it does not provide the rationale as to why the weights should not be released.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fractures of the Extremities, Nursing Care

609. Answer: 2, 5.

**1** A foul odor may indicate the presence of an infection. **2** Constriction of circulation decreases venous return and increases pressure within the vessels. Fluid then moves into the interstitial spaces, causing edema. **3** Drainage on the cast may indicate the presence of an infection. **4** An increased temperature may indicate the presence of an infection. **5** Impaired circulation is evidenced by prolonged capillary refill after the toes are compressed.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Fractures of the Extremities, Nursing Care

610. **4** In crutch walking the client uses the triceps, trapezius, and latissimus muscles. A

client who has been in bed may need to implement an exercise program to strengthen these shoulder and upper arm muscles before initiating crutch walking.

**1** This activity does not strengthen muscles used in crutch walking. **2** Keeping the leg in abduction alters the center of gravity, which impedes ambulation. **3** Back muscles are not used in crutch walking.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

611. **3** The paraplegic client is unable to exercise the lower extremities actively.

**1** Changing a position involves moving the extremities; contractures develop as a result of prolonged immobility. **2** The use of pillows, splints, and other supportive devices helps maintain alignment and prevents the shortening of muscle fibers associated with contractures. **4** Passive range-of-motion exercises help maintain joint mobility and prevent contractures.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

612. **4** Calcium that has left the bones as a response to prolonged inactivity enters the blood and may precipitate in the kidneys, forming calculi.

**1** Increased fluid intake is helpful in avoiding this condition by preventing urinary stasis. **2** Calcium intake usually is limited to prevent the increased risk for calculi. **3** Calculi may develop despite adequate kidney function; kidney function may be impaired by the presence of calculi and urinary tract infections associated with urinary stasis or repeated catheterizations.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

613. **4** Calcium leaves the long bones during periods of prolonged bed rest. The tilt table places the client in an upright position, which provides for weight-bearing.

**1** The tilt table is used to prevent orthostatic hypotension by gradually allowing an individual who has been immobilized to adjust to an upright position. **2** The client is carefully strapped to the table so that mobility is actually impaired to ensure safety. **3** Although the pressure on bony prominences is altered, the use of the tilt table is not frequent enough to prevent the development of pressure ulcers.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Spinal Cord Injury, Nursing Care

614. **3** Rehabilitating exercises carried out under water minimize strain on the body. The buoyant force of the water enables the limbs to move more easily.

**1** Exercises are carried out near the surface of the water, where the water pressure will have little effect. **2** Water temperature will not assist movement. **4** Vapors are produced above water as a result of evaporation; they do not facilitate exercise.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Review of Anatomy & Physiology, Review of Physical Principles

615. **3** As a result of contraction and pulling of the muscles on the two bone fragments, there is a characteristic shortening of the femur with external rotation of the extremity.

**1** Lateral motion of the leg does not occur; the leg externally rotates. **2** Lateral motion of the leg does not occur. **4** The extremity externally rotates as the muscles contract; shortening, not lengthening, occurs.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Fracture of the Hip, Data Base

616. **1** Traction may be used in the treatment of a fractured hip to align the bones (reduction of fracture). If such traction is not employed, the muscles may go into spasm, shifting the bone fragments and causing pain.

**2** Traction is a temporary measure before surgery; contractures result from a shortening of the muscles by prolonged immobility. **3** Although the affected extremity must be properly aligned, turning and moving the client can and should be done. **4** External rotation is contraindicated and prevented by the use of positioning aids.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Data Base

617. **3** A fracture in the neck of the femur will cause shortening of the femur and external rotation. To correct this misalignment, the client's leg should be extended and maintained in slight internal rotation.

**1, 2** To reduce the fracture, it is necessary to maintain the leg in extension, counteracting the contraction of the quadriceps that may cause overriding of bone fragments. **4** External rotation of the thigh as a result of muscle contraction tends to misalign the bone fragments; therefore, slight internal rotation or functional alignment is preferred.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Data Base

618. **1** After a fractured hip, the muscle spasms and the client's tendency to flex the hips can lead to flexion contractures of the hip.

**2** Abduction contractures do not occur; abduction is maintained if a prosthesis is used to keep the head of the femur in the acetabulum. **3** Contractures most often involve flexor, not extensor, muscles. **4** The hip will tend to externally rotate.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Data Base

619. **4** After a fracture, if blood supply is cut off or impaired, necrosis of the bone may occur from lack of oxygen and nutrient perfusion.

**1** The word *aseptic* indicates that infection is not present. **2** Early weight-bearing at the fracture site may result in trauma to the bone; circulation is not impaired. **3** Immobilization does not cut off circulation to the bone; it may cause contractures.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 11, Fracture of the Hip, Data Base

620. **3** Elevating the foot of the bed uses gravity and the client's weight for countertraction.

**1** This will not increase countertraction. **2** This will increase traction rather than countertraction. **4** This will have no effect on countertraction.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Data Base

621. **4** This type of walker can be used by a client with partial weight-bearing who has enough upper body strength to lift and move the walker forward. A standard walker with rubber tips is designed for those who need more support than a cane.

**1** Kyphosis is an exaggerated angulation of the posterior curve of the thoracic spine.

Kyphosis alters the client's center of gravity, making the use of crutches unsafe. **2** A quad cane requires weight-bearing on both legs. Partial weight-bearing means that the client may put minimal weight on the affected extremity. **3** A straight cane requires weight-bearing on both legs.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

622. **3** This position involves hip flexion greater than 90 degrees. This puts stress on the operative site and may dislodge the prosthesis.

**1, 2, 4** This is acceptable because little stress is placed on the operative site.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Data Base

623. **2** Ankle movement, particularly dorsiflexion of the foot, allows muscle contraction, which compresses veins, reducing venous stasis and the risk for thrombus formation.

**1** Because the client is being turned, the client's muscles are not contracting to compress the veins and prevent venous stasis. The client must be turned at least every 2 hours to help prevent skin breakdown and pneumonia. **3** Sitting for long periods is contraindicated because pressure on the popliteal space and the dependent position of the lower extremities increase venous stasis. **4** The client is generally not allowed out of bed until the first postoperative day.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

624. **3** Assessment of the pedal pulse should include the strength of the pulse. Symmetry, the correspondence of homologous parts on opposite sides of the body, indicates whether the pulses are equal.

**1** Contractility is not a characteristic of a pulse but of the heart; rate is not measured with pedal pulses. **2** Color of skin is not a pulse characteristic; rhythm relates to the heart; it does not reflect a peripheral problem. **4** Local temperature is not a characteristic of the pedal pulse; pulsations are not visible in pedal pulses.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing

## Care

625. **1** The client is most likely experiencing fat embolism syndrome (FES). The average time of onset of FES is 18 to 24 hours after injury to long bones or crushing injury. Fat globules and tissue thromboplastin exit from bone marrow and local tissue as a result of injury. Fat molecules enter venous circulation, move to lungs, and embolize small capillaries. Petechial rash on neck, chest, conjunctivae, or axillae is a classic sign of FES (occurs in 50% to 60% of clients with FES). Increased temperature, pulse rate, and respirations are associated with FES; 75% of clients with FES exhibit neurologic signs such as altered mental state, restlessness, agitation, lethargy, confusion, or coma.

**2** The client is not experiencing urinary retention because output indicates adequate hourly output of at least 50 mL/hr. **3** The client is not experiencing hypovolemic shock. Although the client may experience tachypnea, tachycardia, and an increased temperature with hypovolemic shock, the blood pressure will decrease and urine output will decrease to less than 30 mL/hr. **4** The client is not experiencing a pulmonary embolism. This is more likely to occur 4 to 10 days after trauma. Although tachypnea, tachycardia, an increased temperature, restlessness, and agitation are common with pulmonary embolism, the client is not exhibiting sudden chest pain, dyspnea, cough, or hemoptysis, or areas of dullness or crackles when auscultating breath sounds.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Fracture of the Extremities, Nursing Care

626. **2** Because of the recumbent position, drainage may flow under the client and not be noticed.

**1** This should be done more frequently; however, the site is a more reliable indicator of hemorrhage. **3** The girth of the thigh is not an indicator of hemorrhage. **4** Dressings impede accurate assessment.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

627. **1** This supports the site; the involved leg must be maintained in alignment, avoiding adduction to prevent dislocation of the prosthesis.

**2** The pillow will not affect venous return, which relates to thrombus formation. **3** Adduction, not flexion contractures, is of most concern after surgery. **4** Although friction is decreased when skin does not interface with skin, this is not the main reason for separating the lower limbs.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

628. **2** Placing the feet apart creates a wider base of support and brings the center of gravity closer to the ground. This improves stability.

**1** Bending at the waist should be avoided because it strains the lower back muscles; the power for lifting should be supplied by the muscles of the thighs and buttocks. **3** Pressure on the abdomen is prevented by tightening the abdominal and

gluteal muscles to form an internal girdle; keeping the body straight does not reduce strain on the abdominal musculature. **4** Relaxing the abdominal muscles with physical activity increases back strain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Review of Anatomy & Physiology, Review of Physical Principles

629. Answer: 1, 3, 5.

**1** Increased skin temperature may indicate the presence of an infection; decreased skin temperature suggests impaired circulation. **2** Flexion and abduction of the hip are contraindicated because they may dislodge the head of the femur from the acetabulum. **3** This assesses the neural integrity distal to the surgical site. **4** No external pins are present with an internal fixation. **5** This assesses the circulatory integrity distal to the surgical site.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

630. **2** Weight-bearing on the uninvolved leg helps maintain its muscle tone while limiting the stress on the involved extremity.

**1** When the legs are in a dependent position, venous return is reduced. **3** Speed is not important when moving a client from the bed to a chair. **4** This is an unacceptable rationale for care.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

631. **4** The pelvis is elevated by actions involving the unaffected upper extremities and unoperated leg.

**1** It is impossible to lift the pelvis with this movement. **2** The involved leg should not be used because it may dislodge the prosthesis. **3** The client should not turn on the operative side immediately after surgery.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

632. **3** The three-point gait, which requires arm strength, is used when a limb cannot bear weight. The affected leg and crutches are advanced together, and the strong leg swings through.

**1, 2** This requires weight-bearing on both feet. **4** This gait does not simulate ambulation and is not appropriate for this client.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

633. **3** To prevent nerve damage in the axillary area, the palms should bear all the weight.

**1** This is unsafe and next to impossible to perform. **2** Pressure in the axillary area causes nerve damage to the brachial plexus. **4** Weight-bearing on the affected lower extremity is initially contraindicated.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Procedures, Mobility: Assistive Devices

634. Answer: 2, 4.

1 Climbing stairs does not cause undue stress on the operative site. 2 Crossing the legs past the midline of the body puts stress on the operative site, which increases the risk for dislocation of the prosthesis. 3 This is encouraged as long as no extremes of position are used. 4 Excessive flexion of the hip can cause dislocation of the prosthesis. 5 This is encouraged because it prevents hip flexion contractures.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Fracture of the Hip, Nursing Care

635. 2 Because pain is an all-encompassing and often demoralizing experience, the client should be kept as pain-free as possible.

1 Surgery is used to correct deformities and facilitate movement; relief of pain is the priority. 3 Concentration is difficult when a client is in severe pain; relief of pain is the priority. 4 Motivation is difficult when a client is in severe pain; relief of pain is the priority.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

636. 3 An antinuclear antibody test (ANA) may be positive in clients with autoimmune disorders such as rheumatoid arthritis and systemic lupus erythematosus.

1 Pancreatic lipase is an enzyme that catalyzes the breakdown of lipids; this is a test used to diagnose pancreatic problems. 2 Bence Jones protein is a urine test helpful in diagnosing multiple myeloma. 4 Alkaline phosphatase is a blood test that determines phosphorus activity; it is used in diagnosing liver and biliary tract disorders and identifying periods of active bone growth or metastasis of cancer to bone.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Arthritis, Data Base

637. 4 Pushing off with the palms of the hands rather than the fingers uses the strongest joints available to rise from a chair.

1 Pressing water from a sponge rather than wringing maintains the joints of the hands in a neutral position. Wringing a sponge requires finger flexion, which places strain on the joints of the hand. 2 The client with ulnar drift deformities of both hands should have faucets and doorknobs that require pushing rather than turning. Pushing exerts less stress on the joints of the hands during routine activities. Turning a doorknob or faucet requires grasping and twisting motions that strain the small joints of the hands. 3 An ulnar drift deformity limits the ability to grasp small objects. Sewing projects require gripping a needle or hook as well as repetitive motions that should be avoided because they strain the joints of the hands.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

638. 1 Active exercises, alternated with periods of rest, offer the best chance at avoiding

the joint deformities associated with rheumatoid arthritis because they can move each involved joint through its full range of motion.

2 Massage affects the muscles, not the joints, and will do little to prevent deformities. 3 Immobilization of joints by bracing will promote the formation of contractures and deformities. 4 Isometric exercise will promote muscle, not joint, function.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

639. 3 Range-of-motion exercises are instituted to maintain mobility of joints. Balanced activity and rest will promote resolution of the inflammation.

1 Pain may persist but cannot be allowed to legitimize inactivity. 2 Activity will not prevent the inflammatory process; it may aggravate it. 4 Severely damaged joints may require prosthetic replacement.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

640. Answer: 1, 2.

1 Osteoarthritis affects the weight-bearing joints (e.g., hips and knees) first because they bear the most body weight. The resulting joint damage causes a series of physiologic responses (e.g., release of cytokines and proteolytic enzymes) that lead to more damage. 2 Osteoarthritis affects the weight-bearing joints (e.g., hips and knees) first because they bear the most body weight. 3 Although the ankles are weight-bearing joints and eventually are affected, the motion in the ankles is not as great as in the hips and knees; thus, there is less degeneration. 4 Shoulder joints are not the most likely to be involved first because these are not weight-bearing joints. 5 Although the distal interphalangeal joints are frequently affected, the remaining interphalangeal joints and metacarpals are not.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Arthritis, Data Base

641. 2 Steroids have an antiinflammatory effect that can reduce arthritic pannus formation.

1 This will not provide lubrication. 3 Injection of a drug into a joint is not physiotherapy. 4 Ankylosis refers to fusion of joints. It is only indirectly influenced by steroids, which exert their major effect on the inflammatory process.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Data Base

642. 2 Ossification of cartilage, particularly of the spine, causes fixation of the involved joints.

1 Inflammation and thickening of the synovial membrane are characteristics of arthritis. 3 Although rest is essential, complete immobility will result in loss of joint motion. 4 Redness and swelling are symptoms of local inflammation; they do not indicate irreversible damage.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Data Base

643. **2** Heberden nodules are the bony or cartilaginous enlargements of the distal interphalangeal joints that are associated with osteoarthritis.

**1, 3, 4** These deformities occur with rheumatoid arthritis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Data Base

644. **3** Inactivity over an extended time increases stiffness and pain in joints.

**1** Assistive exercises help maintain joint mobility. **2** This is not a factor; cold applications may decrease joint discomfort. **4** The latex fixation test is positive when the rheumatoid factor is found in blood serum; this factor is present in many conditions, including rheumatoid arthritis, aging, narcotic addiction, and SLE.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Arthritis, Data Base

645. **4** There are no dietary restrictions, but iron and vitamins should be encouraged to treat any underlying nutritional deficiencies.

**1** These nutritional restrictions are not indicated. **2** A high-calorie diet will increase the client's weight; this is contraindicated because it will increase the strain on weight-bearing joints. **3** A balanced diet should fulfill nutritional needs; there is no need to increase protein or restrict calcium.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

646. **1** Because of its antiinflammatory effect, aspirin is useful in treating arthritis symptoms.

**2, 3** Opioids should be avoided because they promote drug dependency and do not affect the inflammatory process. **4** Alprazolam (Xanax) is an antianxiety, not an antiinflammatory, agent.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Related Pharmacology, Nonsteroidal Antiinflammatory Drugs

647. Answer: **1, 4.**

**1** Exercise of involved joints is important to maintain optimal mobility and prevent buildup of calcium deposits. **2** Immobilization causes loss of joint mobility and contractures. **3** Immobility promotes the development of contractures. **4** Functional alignment places the least strain on joints, muscles, and tendons. **5** Immobilization with pillows promotes the development of contractures.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

648. **3** Heat and cold applications reduce inflammation and discomfort.

**1** This will depend on the client's tolerance. **2** Avoiding exercise will increase the destructive effects of immobility. **4** Exercises are necessary to prevent contractures and permanent joint damage, but cannot be gradually increased unless the client is able to

tolerate them.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 11](#), Arthritis, Nursing Care

649. **4** There is no special diet for arthritis. A balanced diet, consisting of foods from all groups of the MyPlate dietary guidelines, is essential in maintaining nutrition.

**1, 2** Limiting the diet to particular foods does not provide all the essential nutrients. **3** If nutritional intake is adequate, large doses of multivitamins are unnecessary and are dangerous.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 11](#), Arthritis, Nursing Care

# Urinary/Reproductive Systems

650. **1** Primitive sex cells, called spermatogonia, are present in newborn males. At puberty these cells mature and form spermatozoa (spermatogenesis).

**2** Spermatogenesis does not occur until puberty. **3** Spermatogonia are found at this time. **4** Only immature cells are found during this period.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Review of Anatomy and Physiology of the Reproductive System

651. **3** Sperm cells are fragile and can be destroyed by heat, causing sterility.

**1** Sperm do not move through the urine; they are found in semen. **2** Sperm achieve motion from their flagella; they move from the epididymis to the vas deferens to the ejaculatory ducts to the urethra. **4** During embryonic development the testes are not suspended.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Review of Anatomy and Physiology of the Reproductive System

652. **4** Assessment is the first step in the nursing process. The nurse should determine if the client is a danger to self or others before planning and implementing care.

**1** No pattern of unsafe behavior has been identified requiring the use of wrist restraints. Pulling on the retention catheter is a concern because this may cause an injury.

However, less restrictive alternatives to wrist restraints should be tried first. A restraint is used as a last resort. **2** Orienting a client to time, place, and person is appropriate for a client with delirium; however, this will not protect the client from attempting to pull out the urinary catheter or from engaging in other unsafe behaviors. **3** Although family members should be involved in a client's care, it is not the responsibility of a family member to assess a client or protect a client from injury.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Related Procedures, Urinary Catheterization

653. **4** The prostate-specific antigen (PSA) is an indication of cancer of the prostate; the higher the level, the greater the tumor burden.

**1** Increased creatinine levels may be caused by impaired renal function as a result of blockage by an enlarged prostate, but do not indicate that metastasis has occurred. **2** Increased blood urea nitrogen (BUN) levels may be caused by impaired renal function as a result of blockage by an enlarged prostate, but do not indicate that metastasis has occurred. **3** Nonprotein nitrogen refers to waste products from metabolism of protein and includes urea, creatinine, uric acid, and ammonia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Cancer of the Prostate, Data Base

654. **3** Inability to empty the bladder as a result of pressure exerted by the enlarging prostate on the urethra causes a backup of urine into the ureters and finally the kidneys

(hydronephrosis).

**1** Benign prostatic hyperplasia (BPH) develops over the client's life span; it is not congenital. **2** It is uncommon for BPH to become malignant. **4** The acid phosphatase level is increased in prostatic carcinoma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Benign Prostatic Hyperplasia, Data Base

655. **2** The prostate gland is a tubuloalveolar gland shaped like a ring, with the urethra passing through its center.

**1** The epididymis lies along the top and sides of the testes. **3** The seminal vesicles are on the posterior surface of the bladder. **4** The bulbourethral gland lies below the prostate.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Review of Anatomy and Physiology of the Reproductive System

656. **4** Because the female's urethra is closer to the anus than the male's, it is at greater risk for becoming contaminated.

**1** Urinary pH is within the same range in both males and females. **2** Hormonal secretions have no effect on the development of bladder infections. **3** The position of the bladder is the same in males and females.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urinary Tract Infections, Data Base

657. **2** Refrigeration retards the growth of bacteria and may preserve the specimen for several hours.

**1, 3** Growth of bacteria will alter the pH and the glucose and protein levels in the urine; it must be refrigerated to retard growth. **4** This represents an unnecessary waste of time, effort, and money.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urinary Tract Infections, Nursing Care

658. **3** This ensures drainage and prevents bladder distention and other complications. Patency of the catheter should be established before any other intervention.

**1** This is premature. This may be necessary if the catheter is clogged. This usually is required when the drainage is viscous rather than liquid. **2** Assessment is necessary before consultation with the health care provider. **4** Irrigation is avoided if possible because of the associated risk for infection.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Related Procedures, Urinary Catheterization

659. **3** An indwelling catheter dilates the urinary sphincters, keeps the bladder empty, and short-circuits the reflex mechanism based on bladder distention. When the catheter is removed, the body must adapt to functioning once again.

**1, 4** Although this may cause difficulty in voiding, there are no data presented to draw

this conclusion. **2** A sedentary lifestyle will not cause this problem.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 12, Related Procedures, Urinary Catheterization

660. **Answer: 6 tablets.** Use the “Desire over Have” formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire } 30 \text{ mg}}{\text{Have } 5 \text{ mg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$5x = 30$$

$$x = 30 \div 5$$

$$x = 6 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

661. **3** An enlarged prostate constricts the urethra, interfering with urine flow and causing retention. When the bladder fills and approaches capacity, small amounts can be voided, but the bladder never empties completely.

**1** Edema does not cause the client to void frequently in small amounts. **2** Dysuria is painful or difficult urination, which is not part of the client’s responses. **4** The urge to void is caused by stimulation of the stretch receptors as the bladder fills with urine; in suppression, little or no urine is produced.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 12, Cancer of the Prostate, Data Base

662. **4** Cleansing the urinary meatus and adjacent skin removes accumulated bacteria, limiting the possible introduction of microbes into the urinary tract. The catheter should be stabilized so that bathing does not advance the catheter further into the meatus.

**1** Although cleansing the perineal area is helpful, it is actually the organisms closest to the meatus that gain entry to the urinary tract first. **2** Although encouraging fluids helps prevent urinary stasis and subsequent infection, the most common source of infection is microorganisms from around the meatus. **3** Irrigations require opening the closed drainage system, allowing the entry of microorganisms; this increases the risk for infection.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Related Procedures, Urinary Catheterization

663. **2** The total amount of irrigation solution instilled into the bladder is eliminated with urine and therefore must be subtracted from the total output to determine the volume of urine excreted.

**1** An accurate specific gravity cannot be obtained when irrigating solutions are instilled into the bladder. **3** Hourly outputs are indicated only if there is concern about renal failure or oliguria. **4** A 24-hour urine test is not accurate if the client is receiving continuous irrigations.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Related Procedures, Continuous Bladder Irrigation

664. **3** The length of the urethra is shorter in females than in males; therefore, microorganisms have a shorter distance to travel to reach the bladder. The proximity of the meatus to the anus in females also increases the incidence of urinary tract infections.

**1** Fluid intake may or may not be adequate in both males and females and does not account for the difference. **2** Hygienic practices can be inadequate in males or females. **4** Mucous membranes are continuous in both males and females.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urinary Tract Infections, Data Base

665. **4** The causative organism should be isolated before starting antibiotic therapy.

**1** Catheterization is not a routine intervention for urethritis. **2** Although client teaching is important, it is not the priority at this time. **3** A 24-hour urine test will not determine the infective organism causing the problem.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Urinary Tract Infections, Nursing Care

666. **1** Cloudy urine usually indicates purulent drainage (pyuria) associated with infection.

**2** Viscosity is a characteristic that is not measurable. **3** Urinary glucose levels are not affected by urinary tract infections. **4** Specific gravity yields information related to fluid balance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Urinary Tract Infections, Nursing Care

667. **Answer: 2 tablets.** First convert 0.1 g to its equivalent in mg by multiplying by 1000 (move the decimal 3 places to the right). Use the "Desire over Have" formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire } 100 \text{ mg}}{\text{Have } 50 \text{ mg}} = \frac{x \text{ tablets}}{1 \text{ tablet}}$$

$$50 x = 100$$

$$x = 100 \div 50$$

$$x = 2 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration  
668. 4 Hemolytic streptococci, common in throat infections, can initiate an immune reaction that damages the glomeruli.

1 Baths may be linked to urethritis, not glomerulonephritis. 2 Fluid restriction is moderated as the client improves; fluid helps prevent urinary stasis. 3 Activity helps prevent urinary stasis.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Glomerulonephritis, Data Base

669. 1 Sharp, severe pain (renal colic) radiating toward the genitalia and thigh is caused by ureteral distention. The priority is to relieve the pain.

2 Although the client is overweight and weight loss is desirable, it is a long-term goal. 3 Although hematuria is a concern, blood loss usually is not massive. 4 Hypertension is not specific to urinary calculi.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Nursing Care

670. Answer: 2, 3, 5.

1 Fluids should be encouraged to promote dilute urine and facilitate passage of the calculi. 2 A urinary calculus may obstruct urine flow, which will be reflected in a decreased output; obstruction may result in hydronephrosis. 3 Urine is strained to determine whether any calculi or calcium gravel is passed. 4 Blood pressure assessment is of no particular importance to the client with kidney stones (calculi). 5 Reduction of pain is a priority. A calculus obstructing a ureter causes flank pain that extends toward the abdomen, scrotum and testes, or vulva; the pain begins suddenly and is severe (renal colic).

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Nursing Care

671. Answer: 3, 4.

1 Eggs are not high in purine and need not be avoided. 2 Fruits are not high in purine and need not be avoided. 3 Uric acid stones are controlled by a low-purine diet; foods high in purine, such as organ (glandular) meats, should be avoided. 4 Uric acid stones are controlled by a low-purine diet; foods high in purine, such as meat extracts (e.g., gravy), organ meats, turkey, and whole grains should be avoided. 5 Raw vegetables are not high in purine and need not be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Data Base

672. 4 Output should be at least 30 mL/hr or more; a decreased output may indicate obstruction or impaired kidney function.

1 Blood, tinting the urine pink, is expected. 2 Drainage may be pink; bright red drainage should be reported. 3 This intake is adequate; however, a higher intake is usually preferred (e.g., 2000 to 3000 mL).

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Nursing Care

673. 2 Pain relief is the priority. Clients report that ureteral colic is excruciatingly painful. Once pain is under control and the client is comfortable, other medical and nursing interventions can be implemented.

1 Although straining all urine is required, pain relief is the priority. Once the client is medicated for pain, the urine that was set aside can be strained. 3 The high-Fowler position is not necessary. The client can be assisted to assume a position of comfort. 4 The urine was sent for a culture and sensitivity in the emergency department.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Nursing Care

674. 2 Calcium and phosphorus are components of these stones; foods high in calcium and phosphorus should be avoided.

1, 4 This diet is indicated for clients with gout. 3 Foods high in phosphorus must be avoided.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Urolithiasis and Nephrolithiasis, Data Base

675. 2 Uric acid stones are controlled by a low-purine diet. Foods high in purine, such as organ meats and extracts, should be avoided.

1 Milk should be avoided with calcium, not uric acid, stones. 3 Cheese should be avoided with cystine, not uric acid, stones. 4 Vegetables do not have to be avoided; however,

legumes should be kept to a minimum.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

[Ch 12](#), Urolithiasis and Nephrolithiasis, Data Base

676. Answer: 3, 4.

**1** Excessive nephron damage in end-stage renal disease causes oliguria, not polyuria; excessive urination is common in early kidney insufficiency from an inability to concentrate urine. **2** Jaundice is common with biliary obstruction, not end-stage renal disease. **3** Azotemia is an increase in nitrogenous waste, particularly urea, in the blood; this is common in end-stage renal disease. **4** Hypertension occurs as a result of fluid and sodium overload and dysfunction of the rennin-angiotensin-aldosterone system. **5** Anemia, not polycythemia, occurs because of decreased erythropoietin, decreased RBC production, and decreased RBC survival time.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** [Ch 12](#), Chronic Kidney Failure, Data Base

677. **1** An output of 50 mL/hr is adequate. When output drops to less than 30 mL/hr, it may indicate renal failure and the health care provider should be notified.

**2** Irrigating the nephrostomy is unnecessary and requires a health care provider's order. **3** Encouraging oral fluids is contraindicated. The client probably will still be under the influence of anesthesia and have no gag reflex. **4** The health care provider should be notified when the hourly output drops to less than 30 mL/hr.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** [Ch 12](#), Adenocarcinoma of the Kidney, Nursing Care

678. **4** Preoperative cleansing of the bowel is necessary before surgical resection and formation of a urinary conduit.

**1** Fluids should not be restricted until 2 to 4 hours before surgery or based on the specific orders of the health care provider. **2** These exercises have no direct effect on this procedure. **3** An ileal conduit is not irrigated.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** [Ch 12](#), Bladder Tumors, Nursing Care

679. **3** The ureters are implanted in a segment of the ileum, and urine drains continually because there is no sphincter; continent catheterizable stomal reservoirs do not continually drain but are accessed with a catheter approximately every 4 hours.

**1** Ileal conduits are not neurologically innervated; therefore, no peristalsis exists. **2** No feces are present in an ileal conduit. **4** Absorption of nutrients is not affected by an ileal conduit.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** [Ch 12](#), Bladder Tumors, Data Base

680. **1** Because of the anatomic position of the incision, drainage will flow by gravity and accumulate under the client lying in the supine position.

**2** Nail beds indicate peripheral perfusion, not early hemorrhage. **3** Respiratory hemorrhage is not common after kidney surgery. **4** The blood pressure decreases and

the pulse rate increases with hemorrhage.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 12, Adenocarcinoma of the Kidney, Nursing Care

681. **1** Postoperatively the client has a suprapubic cystostomy tube to instill a GU irrigant to dilute the urine and limit clot formation, as well as an indwelling catheter under tension to limit bleeding and drain urine.

**2** A nasogastric tube is not expected. **3** The kidneys are not involved in this surgery. **4** The ureters are not involved in this surgery.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 12, Benign Prostatic Hyperplasia, Nursing Care

682. **2** The catheter must be reinserted by the health care provider to ensure bladder emptying, maintain pressure at the operative site, and prevent hemorrhage.

**1** Because of the danger of further trauma to the urethra and surgical site, the health care provider should insert the catheter. **3** Irrigations require a health care provider's order. **4** In addition to urinary drainage, the balloon of the urethral catheter exerts pressure against the prostate to help control bleeding and should be reinserted.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 12, Benign Prostatic Hyperplasia, Nursing Care

683. **1** The bladder is a sterile body cavity; when introducing a solution/catheter, surgical asepsis is required.

**2** Excessive pressure can traumatize the lining of the urinary tract. **3** The solution is generally administered at room temperature. **4** This is done if the fluid does not return by gravity; the negative pressure exerted during aspiration may cause trauma.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 12, Related Procedures, Urinary Catheterization

684. **3** Because the urine and irrigant are mixed, the amount of infused irrigant must be measured accurately and subtracted from the total output to determine the urinary output.

**1** The bedside drainage bag contains both irrigant and urine. **2** The purpose of continuous bladder irrigation is to prevent obstruction of the catheter; stopping the irrigation will increase the risk for obstruction. **4** Both urine and irrigant mix in the bladder and drain from the same port.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 12, Related Procedures, Continuous Bladder Irrigation

685. **1** Bicarbonate buffering is limited, hydrogen ions accumulate, and acidosis results.

**2** The rate of respirations increases in metabolic acidosis to compensate for a low pH. **3** The fluid balance does not significantly alter the pH. **4** The retention of sodium ions is related to fluid retention and edema rather than to acidosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 12, Acute Kidney Failure, Data Base

686. **3** The amount of protein permitted in the diet (usually less than 50 g) depends on the extent of kidney function; excess protein causes an increase in urea concentration, which should be avoided; adequate calories are provided to prevent tissue catabolism that also results in an increase in metabolic waste products.

**1** In kidney failure the kidneys are unable to eliminate the waste products of a high-protein diet. **2** The body is able to synthesize the nonessential amino acids. **4** Urea is a waste product of protein metabolism; the body is able to synthesize the nonessential amino acids.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 12, Acute Kidney Failure, Data Base

687. **2** In kidney failure, as the glomerular filtration rate decreases, phosphorus is retained. As hyperphosphatemia occurs, calcium is excreted. Calcium depletion (hypocalcemia) causes tetany.

**1, 3, 4** The symptoms described are not characteristic of this condition.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12,

Acute Kidney Failure, Data Base

688. **4** An increased blood urea nitrogen level, indicating uremia, is toxic to the CNS and causes mental cloudiness and confusion and can result in a loss of consciousness.

**1** Hyperkalemia is associated with muscle weakness, irritability, nausea, and diarrhea. **2** Hypernatremia is associated with firm tissue turgor, oliguria, and agitation. **3** Dehydration can cause fatigue, dry skin and mucous membranes, and rapid pulse and respiratory rates.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 12, Acute Kidney Failure, Data Base

689. Answer: 2, 4.

**1** Extensive nephron damage causes oliguria, not polyuria. **2** Lethargy results from anemia, buildup of urea, and vitamin deficiencies. **3** Hypotension does not occur; the blood pressure is within the expected range or elevated as a result of increased total body fluid. **4** Muscle twitching results from excess nitrogenous wastes. **5** Metabolic, not respiratory, acidosis occurs because of the kidneys' inability to excrete hydrogen and regulate sodium and bicarbonate levels.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal

Failure, Data Base

690. **4** Diffusion moves particles from an area of greater concentration to an area of lesser concentration; osmosis moves fluid from an area of lesser to an area of greater concentration of particles, thereby removing waste products into the dialysate, which is then drained from the abdomen.

**1** The principle of ultrafiltration involves a pressure gradient, which is associated with hemodialysis, not peritoneal dialysis. **2** Peritoneal dialysis uses the peritoneal

membrane to indirectly cleanse the blood. **3** Dialysate does not clear toxins in a short time; exchanges may occur four or five times a day.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Data Base

691. **4** Peritoneal dialysis uses the peritoneum as a selectively permeable membrane for diffusion of toxins and wastes from the blood into the dialyzing solution.

**1** Peritoneal dialysis acts as a substitute for kidney function; it does not reestablish kidney function. **2** The dialysate does not clean the peritoneal membrane; the semipermeable membrane allows toxins and wastes to pass into the dialysate within the abdominal cavity. **3** Fluid in the abdominal cavity does not enter the intracellular compartment.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Data Base

692. **4** Protein breakdown liberates cellular potassium ions, leading to hyperkalemia, which can cause a cardiac dysrhythmia and standstill. The failure of the kidneys to maintain a balance of potassium is one of the main indications for dialysis.

**1** Ascites occurs in liver disease and is not an indication for dialysis. **2** Dialysis is not the usual treatment for acidosis; usually this responds to administration of alkaline drugs. **3** Dialysis is not a treatment for hypertension; this is usually controlled by antihypertensive medication and diet.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Data Base

693. Answer: 2, 3.

**1** Spasm of the facial muscles following a tap over the facial nerve (Chvostek sign) indicates hypocalcemia. **2** Sodium is the most abundant cation in the extracellular fluid and functions as part of the sodium/potassium pump. In the presence of a deficit, the client will exhibit confusion, lethargy, headache, and muscle cramps. **3** Sodium, a cation in the extracellular fluid, functions as part of the sodium/potassium pump. Lethargy results in the presence of a deficit. **4** Cardiac dysrhythmias are associated with increases or decreases in potassium and calcium. **5** An increase in body temperature reflects a possible infection, not an electrolyte imbalance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Nursing Care

694. Answer: 1, 2, 4.

**1** The presence of a bruit indicates patency of the arteriovenous (AV) fistula. **2** The presence of a vibration or thrill indicates patency of the AV fistula. **3** An AV fistula is internal and is not irrigated. **4** Drawing blood is avoided to prevent damage to the AV fistula. **5** The AV fistula is under the skin and is not clamped.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Nursing Care

695. **2** A baseline weight must be obtained to be able to determine the net fluid loss from dialysis.

**1** This is not necessary; clients with advanced kidney disease may not produce urine. **3** Medications are often delayed until after dialysis to prevent them from being filtered into the dialysate. **4** This applies to peritoneal dialysis, not hemodialysis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Nursing Care

696. **2** Turning from side to side will change the position of the catheter, thereby freeing the drainage holes of the tubing, which may be obstructed.

**1, 3** This does not influence drainage of dialysate from the peritoneal cavity. **4** The position of the catheter should be changed only by the health care provider.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Nursing Care

697. **1** Radiation may damage the bowel mucosa, causing bleeding.

**2** Blood pressure changes are not expected during radiation therapy. **3** Enemas are contraindicated with lower abdominal radiation because of the damaged intestinal mucosa. **4** Diarrhea, not constipation, occurs with radiation that influences the intestine.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Bladder Tumors, Nursing Care

698. **4** The expected serum creatinine range is 0.5 to 1.2 mg/dL. The nurse should obtain additional information that may indicate acute rejection; therefore, the nurse must first assess for decreased urine output and changes in vital signs.

**1** Once additional data are collected (e.g., urine output, current blood work reports) and the IV infusions are checked, the nurse should contact the health care provider, explain the situation, and implement further orders. **2** Eventually the nurse should ensure that proper infusion rates, along with IV medications, are being maintained after the client is first assessed for decreased urine output and for changes in vital signs. **3** Current blood work reports should be obtained after the client is assessed for decreased urine output and changes in vital signs.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Failure, Nursing Care

# Infectious Diseases

699. **1** Malaria is caused by the protozoan *P. falciparum*, which is carried by mosquitoes. **2, 3, 4** This will not prevent protozoa from entering the bloodstream.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Malaria, Data Base

700. Answer: 3, 4.

**1** Oliguria, not polyuria, occurs in malaria-induced kidney failure. **2** Leukopenia does not occur. **3** A high fever (hyperthermia) results from the disease process. **4** Parasites invade the erythrocytes, subsequently dividing and causing the cell to burst. The spleen enlarges from the sloughing of RBCs. **5** Erythrocytosis does not occur.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Malaria, Data Base

701. **4** Maintaining adequate nutritional and fluid balance is essential to life and must be accomplished during periods when intestinal motility is not excessive so that absorption can occur.

**1** Although shaking chills may occur, seizures generally do not occur. **2** Blood transfusions are not used in the treatment of malaria. **3** This is unnecessary; infection can occur only through direct serum contact or a bite from an infected *Anopheles* mosquito.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Malaria, Nursing Care

702. **3** Quinine sulfate is used for malaria when the plasmodia are resistant to the less toxic chloroquine. However, a new strain of *Plasmodium* that is resistant to quinine must be treated with a combination of quinine (quick-acting), pyrimethamine, and sulfonamide (slow-acting) therapy.

**1** The aim of therapy is to eliminate, not control, the parasite. **2** Reinfestation can occur with a different species or strain of *Plasmodium*. **4** The immunity is permanent if drug therapy is successful.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Malaria, Data Base

703. **1** *P. falciparum* in persons who have chronic malaria can cause hemoglobinuria, intravascular hemolysis, and renal failure as a result of destruction of RBCs.

**2, 3, 4** This is unrelated to the development of blackwater fever.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Malaria, Data Base

704. **4** AIDS is diagnosed when an individual with HIV develops one of the following: a CD4<sup>+</sup> T lymphocyte level of less than 200 cells/ $\mu$ L, wasting syndrome, dementia, one of the listed opportunistic cancers (e.g., Kaposi sarcoma [KS], Burkitt lymphoma), or one of the listed opportunistic infections (e.g., *Pneumocystis jiroveci* pneumonia, *M. tuberculosis*). **1, 2** The development of HIV-specific antibodies (seroconversion) accompanied by acute

retroviral syndrome (flu-like syndrome with fever, swollen lymph glands, headache, malaise, nausea, diarrhea, diffuse rash, joint and muscle pain) 1 to 3 weeks after exposure to HIV reflects acquisition of the virus, not the development of AIDS. **3** A client who is HIV positive is capable of transmitting the virus with or without the diagnosis of AIDS.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Data Base

705. **1** The client has a weakened immune response. Instructions regarding rest, nutrition, and avoidance of unnecessary exposure to people with infections help reduce the risk for infection.

**2** Clients can be taught cognitive strategies to cope with depression, but the strategies will not prevent depression. **3** The client may experience social isolation as a result of society's fears and misconceptions; these are beyond the client's control. **4** Although Kaposi sarcoma is related to HIV infection, there are no specific measures to prevent its occurrence.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Nursing Care

706. **2** Epidemiologic evidence has identified breast milk as a source of HIV transmission.

**1** This behavior is not believed to transmit HIV. **3** This is unrelated to transmission of HIV. **4** HIV transmission does not occur from contact associated with caring for a newborn.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Nursing Care

707. Answer: 3, 5.

**1** Wearing a mask is necessary for procedures where splashing of body fluids is anticipated or a risk. **2** Wearing a gown is necessary for procedures where splashing of body fluids is anticipated or a risk. **3** Wearing gloves protects the nurse from potential contamination. Gloves are appropriate when there is a risk of the hands coming into contact with a client's blood or body fluids. **4** Wearing a face shield is necessary for procedures where splashing of body fluids is anticipated. **5** Hand hygiene is the most effective way to prevent the spread of microorganisms.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Nursing Care

708. **1** A person cannot contract HIV by eating from dishes previously used by an individual with AIDS; routine care is adequate.

**2, 3, 4** This is unnecessary.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Data Base

709. **3** Vaseline (petroleum jelly) breaks down condom integrity and will increase the risk for condom failure.

**1** Using Vaseline instead of a water-soluble lubricant shows a lack of knowledge about condom use, a form of safer sex. **2** Although the person is attempting to be responsible, there is a lack of knowledge and the behavior is unsafe. **4** Condom use shows the client has some understanding about the transmission of HIV.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 13, Acquired Immunodeficiency Syndrome, Nursing Care

710. **3** Irritation of the mucosa may cause increased bleeding or perforation and therefore should be avoided.

**1** All clients' diets should be nutritionally balanced; this is not specific to this client's problem. **2** Bulk and roughage may irritate the mucosa and should be decreased. **4** Psychologic support is not the primary goal; efforts should be made to include foods that are psychologically beneficial but eliminate foods that are irritating to the mucosa.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Viral and Bacterial Infectious Gastroenteritis, Data Base

711. **4** *C. welchii* (*C. perfringens*) is a spore-forming bacterium that produces a toxin that decays muscle, releasing a gas; it is one of the major causative agents for gas gangrene.

**1** *Clostridium tetani* enters the body via puncture of the skin and affects the nervous system; gas gangrene does not occur with this organism. **2** Anthrax disease is caused by *Bacillus anthracis*, not *Clostridium*. **3** *Clostridium botulinum* contaminates food that is then ingested, causing botulism.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Tetanus, Data Base

712. **3** Infection is caused by viral contact with the dermal layer of skin; cleansing the wound with soap and water helps remove superficial contaminants.

**1** Antivenins are not effective against microbiologic stresses. **2** A pressure dressing will not prevent infection. **4** Application of a tourniquet may impair circulation and will not prevent infection.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Rabies, Data Base

713. **1** *Toxoplasma gondii*, a protozoan, can be transmitted by exposure to infected cat feces or by ingestion of undercooked, contaminated meat.

**2** Toxoplasmosis is not related to heavy metals. **3** *T. gondii* is a parasite of warm-blooded animals; fish are not considered the source of contamination. **4** Toxoplasmosis is not related to radiation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Toxoplasmosis, Data Base

714. Answer: 1, 2, 4, 5.

**1** Toxins from bacilli invade nervous tissue, causing restlessness. **2** Toxins from bacilli invade nervous tissue, causing muscle spasms and muscular rigidity. **3** Tetanus causes spasms of facial muscles, resulting in a grotesque grinning expression (risus sardonicus) and spasms of masticatory muscles (trismus), not atony of facial muscles. **4** Toxins from the bacillus invade nervous tissue; respiratory spasms may result in respiratory failure. **5** Toxins from bacilli invade nervous tissue, causing spastic contraction of voluntary muscles.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Tetanus, Nursing Care

715. Answer: 4, 5.

**1** The CNS is affected; diarrhea is not a concern. **2** Memory is not affected by this disease. **3** Urinary stasis is not an expected problem; catheterization can be employed if necessary. **4** Rabies, an acute infectious disease affecting the central nervous system causes stiffness of the back of the neck (nuchal rigidity). **5** Painful pharyngeal spasms when swallowing or even looking at water are responsible for the use of the term *hydrophobia* to refer to rabies.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Rabies, Nursing Care

716. **1** Massive doses of penicillin may limit CNS damage if treatment is started before neural deterioration from syphilis occurs.

**2** Tranquilizers are used to modify behavior, not to treat general paresis. **3** Behavior, not paresis, is treated with behavior modification. **4** Electroconvulsive therapy is used to treat certain psychiatric disorders.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Syphilis, Data Base

717. **3** Inflammation associated with gonorrhea may lead to destruction of the epididymis in males and tubal mucosal destruction in females, causing sterility.

**1** Many gonococci have become penicillin resistant and difficult to treat. **2** Gonorrhea is a common sexually transmitted infection. **4** *Neisseria gonorrhoeae* will invade internal structures, particularly the epididymis in males and the fallopian tubes in females.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Gonorrhea, Data Base

718. **3** Once people become sexually active, they usually remain sexually active; a condom, although not 100% effective, is the best protection against gonorrhea in a sexually active person.

**1** This has no proven protective effect against sexually transmitted infections; excessive douching can alter the vaginal environment and may promote an ascending infection. **2** This is not a realistic response to a sexually active person. **4** Spermicidal cream has no protective effect against sexually transmitted infections.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 13, Gonorrhea, Nursing Care

719. **2** Gonorrhea frequently is an ascending infection that affects the fallopian tubes. **1** Syphilis, if untreated, may spread to the nervous system via the blood; it does not usually cause ascending infection of the fallopian tubes. **3** This is an aberrant growth; it will not cause inflammation of the fallopian tubes. **4** A spontaneous abortion should not cause inflammation of the fallopian tubes.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 13, Gonorrhea, Data Base

720. **3** The exudate from herpes virus type 2 is highly contagious; gown and gloves should be worn. A face shield should be worn if there is a potential for splashing of body fluids.

**1** The organism is not in respiratory tract secretions; the organism is present in the exudate from active lesions. **2** This is unnecessary. **4** This is not an airborne infectious disease.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Herpes Genitalis, Nursing Care

721. **4** This is an illustration of herpes simplex type 2 in a female client. There is no medication that cures this disease; however, an antiviral such as acyclovir sodium (Zovirax) generally is prescribed to reduce healing time and the severity of clinical findings.

**1** Zidovudine (Retrovir) is a nucleoside analog reverse transcriptase inhibitor often prescribed to treat acquired immunodeficiency syndrome (AIDS). **2** Metronidazole (Flagyl) is an antimicrobial agent generally prescribed to treat gastroenteritis caused by *Clostridium difficile*. **3** Ceftriaxone (Rocephin) is an antimicrobial agent generally prescribed for gonorrhea.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis **Reference:** Ch 13, Herpes Genitalis, Data Base

722. **3** Although the usual incubation period of syphilis is about 3 weeks, clinical symptoms may appear as early as 9 days or as long as 3 months after exposure.

**1, 2, 4** The usual incubation period is 21 days.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Syphilis, Data Base

723. **1** The tertiary stage is noncontagious; tertiary lesions contain only small numbers of treponemes.

**2** The primary stage lasts 8 to 12 weeks; the chancre is teeming with spirochetes, and the individual is contagious. **3** The duration of the secondary stage is variable (about 5 years); skin and mucosal lesions contain spirochetes, and the individual is highly contagious. **4** The incubation stage lasts 2 to 6 weeks; spirochetes proliferate at the entry site, and the individual is contagious.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 13, Syphilis, Data Base

724. **1** Gonorrhea is a highly contagious disease transmitted through sexual intercourse.

The incubation period varies, but symptoms usually occur 2 to 10 days after contact. Early effective treatment prevents complications such as sterility.

**2** The parents may be unaware that their child has gonorrhea. **3** Most birth control measures do not protect against the transmission of sexually transmitted infections. **4** Contracting venereal infection is not necessarily indicative of promiscuity. **Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 13](#), Gonorrhea, Nursing Care

725. **1** Ceftriaxone (Rocephin) followed by doxycycline (Vibramycin) is specific for *N. gonorrhoeae* and eradicates the microorganism; other treatment regimens are available for resistant strains.

**2** If the disease progresses before the diagnosis is made, complications such as sterility, heart valve damage, or joint degeneration may occur. **3** Transmission is not controlled; the organism is eliminated. **4** If tubal structures, heart valves, or joints degenerate, the pathologic changes will not be reversed by antibiotic therapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** [Ch 13](#), Gonorrhea, Data Base

# Drug-Related Responses

726. **4** Tumor necrosis factor (TNF) is produced mainly by macrophages in synovium; over time, through various mechanisms, the presence of TNF causes inflammation of synovium, destruction of bone and cartilage, joint stiffness, and pain. TNF inhibitors or blockers neutralize TNF, thereby interrupting the inflammatory cascade; this inhibits the inflammatory response and other mechanisms, thereby slowing tissue damage.

**1, 2, 3** TNF inhibitors are not prescribed for clients with this disease.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 11](#), Arthritis, Data Base

727. **3** Povidone-iodine (Betadine) exerts bactericidal action that helps eliminate surface bacteria that will contaminate culture results.

**1** Povidone-iodine does not have this property. **2** It does dry the skin. Alcohol is not used because it is bacteriostatic; it inhibits, not eliminates, microorganisms. **4** Although povidone-iodine may provide a cool feeling, this not a reason for its use.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 3](#), General Nursing Care of Clients at Risk for Infection

728. **2** AcetaZOLAMIDE (Diamox) is a carbonic anhydrase inhibitor that decreases inflow of aqueous humor and controls intraocular pressure in acute angle-closure glaucoma attack.

**1, 3** This diuretic has no effect on the eye. **4** This strong miotic does not affect production of aqueous humor.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** [Ch 11](#), Related Pharmacology, Ophthalmic Agents

729. **2** Methyldopa (Aldomet) is associated with acquired hemolytic anemia and should be discontinued to prevent progression and complications.

**1** Famotidine (Pepcid) will not cause these symptoms; it decreases gastric acid secretion, which will decrease the risk of gastrointestinal bleeding. **3** Ferrous sulfate (Feosol) is an iron supplement to correct, not cause, symptoms of anemia. **4** Levothyroxine (Synthroid) is not associated with RBC destruction.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 6](#), Related Pharmacology, Antihypertensives

730. **3** Spironolactone (Aldactone) is a potassium-sparing diuretic; hyperkalemia is an adverse effect.

**1, 2, 4** This diuretic generally causes hypokalemia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 6](#), Related Pharmacology, Diuretics

731. Answer: **1, 3.**

**1** Albuterol's (Proventil) sympathomimetic effect causes central nervous stimulation,

precipitating tremors, restlessness, and anxiety. **2** Albuterol may cause restlessness, irritability, and tremors, not lethargy. **3** Albuterol's (Proventil) sympathomimetic effect causes cardiac stimulation that may result in tachycardia and palpitations. **4** Albuterol may cause dizziness, not visual disturbances. **5** Albuterol will cause tachycardia, not bradycardia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Pharmacology, Bronchodilators and Antiasthmatics

732. **2** Intrathecal morphine can depress respiratory function depending on the level it reaches within the spinal column; hourly assessments during the first 12 to 24 hours will allow for early intervention with an antidote if respiratory depression needs to be corrected.

**1** Bradycardia and hypotension occur. **3** This time between doses is too long if the client's respirations are depressed. The recommended adult dosage usually is 0.4 to 2 mg every 2 to 3 minutes, if indicated. **4** Central nervous system depression occurs secondary to hypoxia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 3, Pain, Opioid Analgesics

733. **2** Changing positions slowly will help prevent the side effect of orthostatic hypotension.

**1** This drug can relax the esophagus and lead to acid reflux; lying down after meals may intensify this effect. **3, 4** This is not necessary.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

734. **2** Nitroglycerin tablets are affected by light, heat, and moisture. Loss of potency can occur after 3 months, reducing the drug's effectiveness in relieving pain. A new supply should be obtained routinely.

**1** This indicates the tablets have retained their potency. **3, 4** This does not necessarily indicate loss of potency.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Coronary Vasodilators

735. **2** Warfarin (Coumadin) depresses prothrombin activity and inhibits formation of several clotting factors by the liver. Its antagonist is vitamin K, which is involved in prothrombin formation.

**1** Heparin is an anticoagulant. **3** Iron dextran (Imferon) is an iron supplement, not an antidote for warfarin. **4** Protamine sulfate is the antidote for heparin overdose.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

736. **3** Metoprolol (Lopressor) is a beta blocker; it decreases the heart rate and thus is contraindicated with bradycardia.

**1** Metoprolol is an antihypertensive agent. **2, 4** By reducing cardiac output, metoprolol reduces myocardial oxygen consumption, which helps prevent ischemia and anginal pain.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

**737. 1** Beta blockers reduce cardiac output, so they are contraindicated for clients with uncontrolled heart failure.

**2** Beta blockers are used to treat hypertension because they cause vasodilation and decrease cardiac contractility. **3** Beta blockers lower heart rate. **4** Beta blockers are used to treat coronary artery disease because they decrease myocardial oxygen demand by reducing peripheral resistance and cardiac contractility.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

**738. 3** Therapeutic effects of simvastatin (Zocor) include decreased levels of serum triglycerides, LDL, and cholesterol.

**1** This is not related to simvastatin; it is a measure used to evaluate blood coagulation. **2, 4** This is not related to simvastatin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Antilipidemics

**739. 3** Because furosemide (Lasix) and aspirin compete for the same renal excretory sites, salicylate toxicity may occur even with lower dosages.

**1** Aspirin does not affect furosemide metabolism. **2** This response does not take into account other drugs that the client is receiving. **4** Although furosemide has a hyperuricemic effect similar to that of thiazide diuretics, it is not potentiated by aspirin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Diuretics

**740. 3** Nitroglycerin is sensitive to light and moisture, so it must be stored in a dark, airtight container.

**1** This medication usually is taken prn. If more than three tablets are necessary in a 15-minute period, emergency medical attention should be received. **2** This may be an expected side effect, and the medication should not be discontinued. **4** Dizziness indicates the dosage may need to be decreased by the health care provider.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Coronary Vasodilators

**741. 4** This is a nonopioid analgesic that inhibits prostaglandins, which serve as mediators for pain; it does not impact platelet function.

**1, 2, 3** This is a nonselective nonsteroidal antiinflammatory drug (NSAID) that is

contraindicated for clients undergoing surgery; nonselective NSAIDs have an inhibitory effect on thromboxane, a strong aggregating agent, and can result in bleeding.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Related Pharmacology, Other Nonopioid Analgesics

742. **2** As renal perfusion increases, urinary output also should increase; doses greater than 10 mcg/kg/min can cause renal vasoconstriction and decreased urinary output.

**1** A change in blood pressure is not a direct predictor of the effectiveness of DOPamine given at a level of 2 mcg/kg/min; at 10 mcg/kg/min a client will experience an increased cardiac output and an increased blood pressure. **3** Body temperature does not indicate improved renal perfusion. **4** In this situation, improvement of renal perfusion is not directly related to the client's level of consciousness.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Medications to Manage Hypotension in Shock

743. Answer: 3, 4, 5.

**1** The diet should provide maximum protein and carbohydrates to meet demands related to restoration of body cells and energy. **2** This will not alter the client's nutrition. **3** Selecting preferred foods increases the likelihood of the client eating the food. **4** Small, frequent feedings are better tolerated than large meals. **5** Antiemetics should be administered prophylactically to decrease nausea and enhance appetite.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, General Nursing Care of Clients with Neoplastic Disorders

744. Answer: 1, 3.

**1** Visual disturbances are serious effects because retinopathy can occur with hydroxychloroquine (Plaquenil). **2** Urinary retention is not related to these drugs. **3** Bleeding tendencies, a potential effect of both drugs, may indicate thrombocytopenia, which can be life threatening. **4** Difficulty swallowing does not occur; however, nausea and vomiting may occur with both drugs. **5** Although irritability and restlessness may occur with both drugs, it is not life threatening and does not have to be reported to the health care provider immediately.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 11, Arthritis, Nursing Care

745. **1** Toxic levels of digoxin (Lanoxin) stimulate the medullary chemoreceptor trigger zone, resulting in anorexia, nausea, and vomiting.

**2, 3, 4** Although anorexia, nausea, and vomiting may be side effects of this drug, they do not indicate toxicity.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Cardiac Glycosides

746. Answer: 1, 3.

**1** Most chemotherapeutic agents interfere with mitosis. The rapidly dividing cells of the mucous membranes of the gastrointestinal tract are affected, causing stomatitis and diarrhea. **2** Most chemotherapeutic agents interfere with mitosis. The bone marrow consists of rapidly dividing cells, and therefore its activity is depressed. Leukopenia, not leukocytosis, can occur. **3** Bone marrow depression often causes thrombocytopenia, resulting in bleeding tendencies. **4** The erythrocyte sedimentation rate (ESR) generally increases in the presence of tissue inflammation or necrosis. **5** Hemoglobin and hematocrit levels may decrease because of an inadequate number of RBCs related to bone marrow depression.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 3, Neoplastic Disorders, Related Pharmacology, Major Side Effects

747. **2** Visual disturbances, such as blurred and/or yellow vision, may be evidence of digoxin (Lanoxin) toxicity.

**1** Chest pain is not a toxic effect of digoxin (Lanoxin). **3** Persistent hiccups (singultus) are not related to digoxin toxicity. **4** An increased urinary output is not a sign of digoxin toxicity; it may be a sign of a therapeutic response to the drug, an improved cardiac output.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Cardiac Glycosides

748. **2** Amiodarone (Cordarone) is a class III antidysrhythmic used to treat ventricular and supraventricular tachycardia, and conversion of atrial fibrillation.

**1** This response is expected with antilipidemics.

**3** This response is expected with antihypertensives.

**4** This response is expected with antianginal agents such as nitrates.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation; **Reference:** Ch 6, Related Pharmacology, Cardiac Glycosides

749. **4** The dosage of warfarin (Coumadin) is adjusted according to INR results; if the client fails to take the drug as prescribed, test results will not be reliable in monitoring the client's response to therapy.

**1** Although some medications can affect the absorption or metabolism of warfarin and should be investigated, this is less likely to be a cause of fluctuations in laboratory values. **2, 3** This does not affect the absorption of warfarin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

750. **4** Warfarin (Coumadin) is administered orally for 2 or 3 days to achieve the desired effect on the INR level before heparin is discontinued.

**1** These drugs do not dissolve clots already present. **2** Because each drug affects a different part of the coagulation mechanism, dosages must be adjusted

separately. **3** This does not account for the reason for the administration of both drugs; warfarin will not exert an immediate therapeutic effect.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Anticoagulants

751. **1** Warfarin (Coumadin) causes an increase in the prothrombin time and INR level, leading to an increased risk for bleeding. Any abnormal or prolonged bleeding must be reported, because it may indicate an excessive level of the drug.

**2, 3, 4** This is not a sign of bleeding, the primary concern with warfarin (Coumadin).

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Anticoagulants

752. **2** Acetylsalicylic acid (aspirin) can cause decreased platelet aggregation, increasing the risk for undesired bleeding that may occur with administration of anticoagulants.

**1** Ferrous sulfate does not affect warfarin (Coumadin); it is used for RBC

synthesis. **3** Atenolol (Tenormin) is a beta blocker that reduces blood pressure; it does not affect bleeding. **4** Chlorpromazine (Thorazine) is a neuroleptic; it does not affect bleeding.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Anticoagulants

753. **3** Assessment for bleeding is a priority when administering a thrombolytic agent because it may lead to hemorrhage.

**1** The heart rate is not affected. **2** Electrolyte levels are not affected. **4** This is not necessary.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 6, Related Pharmacology, Thrombolytics

754. **3** INH (isoniazid) often leads to vitamin B<sub>6</sub> (pyridoxine) deficiency because it competes with the vitamin for the same enzyme; this deficiency most often is manifested by peripheral neuritis, which can be controlled by regular administration of vitamin B<sub>6</sub>.

**1** Vitamin B<sub>6</sub> does not improve immune status. **2** Pyridoxine does not enhance INH effects. **4** Pyridoxine does not destroy organisms.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antituberculars

755. Answer: 2, 3, 5.

**1** Morphine does not increase urine output. **2** The CNS depressant effect of morphine causes lethargy. **3** The CNS depressant effect of morphine causes bradycardia. **4** Morphine causes constriction of pupils. **5** The CNS depressant effect of morphine causes bradypnea.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 3, Related Pharmacology,

## Opioid Analgesics

756. **1** Morphine binds with the same receptors as natural opioids. However, it has a rapid onset, lowers the blood pressure, decreases pulmonary reflexes, and produces sedation.

**2** Phenobarbital has a slower onset than morphine and does not affect respirations and blood pressure to the same extent as morphine. **3** HydrOXYzine (Atarax) generally is used to control anxiety associated with less acute situations. **4** Chloral hydrate is a hypnotic that is not appropriate for the acute situation described.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 7, Pulmonary Edema, Data Base

757. **4** Glucosamine, a precursor in the synthesis of glycosylated proteins and lipids, helps prevent cartilage degeneration. The glucosamine molecule is glucose-based and may be unsafe for a client who has impaired glucose tolerance; also it may increase resistance to insulin and interfere with antidiabetic medication.

**1** Studies suggest that glucosamine helps to slow the progression of osteoarthritis and even regenerate damaged cartilage; this results in improved joint function and reduction of joint pain and stiffness. **2, 3** Glucosamine does not appear to be harmful to clients with this health problem.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 11, Arthritis, Data Base

758. **4** Carbidopa/levodopa (Sinemet) is a metabolic precursor of dopamine; it reduces sympathetic outflow by limiting vasoconstriction, which may result in orthostatic hypotension.

**1** Carbidopa/levodopa should be administered with food to minimize gastric irritation. **2** Although periodic tests to evaluate hepatic, renal, and cardiovascular status are required for prolonged therapy, whether these tests should be done on a weekly basis has not been established. **3** Carbidopa/levodopa may produce either symptom, but no established pattern of such responses exists.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 11, Related Pharmacology, Antiparkinson Agents

759. **1** Gingival hyperplasia is an adverse effect of long-term phenytoin (Dilantin) therapy; incidence can be decreased by maintaining therapeutic blood levels and meticulous oral hygiene.

**2** Alkalinity is not related to phenytoin or to gingival hyperplasia caused by phenytoin. **3** These are not direct effects of phenytoin. **4** Plaque and bacterial growth at gum line are unrelated to phenytoin or to hyperplasia caused by it.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 11, Related Pharmacology, Anticonvulsants

760. **4** Edrophonium (Enlon), an anticholinesterase, causes temporary relief of symptoms of myasthenia gravis in clients who have the disease and is therefore an effective

diagnostic aid.

**1** Symptoms will decrease. **2** Level of consciousness is not affected. **3** Hypotension may occur.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Related Pharmacology, Cholinesterase Inhibitors

761. **1** Warfarin (Coumadin) has been shown to inhibit metabolism of phenytoin (Dilantin), which results in an accumulation of phenytoin in the body.

**2** Coumadin potentiates the anticoagulant effect of heparin. **3** This is true only if the client is receiving phenytoin to control the seizure disorder. **4** Seizures do not have a significant effect on the metabolism of warfarin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Pharmacology, Anticonvulsants

762. **1** Phenytoin (Dilantin) inhibits folic acid absorption and potentiates the effects of folic acid antagonists. Folic acid (Folate) is helpful in correcting certain anemias that can result from administration of phenytoin. The dosage must be carefully adjusted because folic acid diminishes the effects of phenytoin.

**2, 3, 4** This is not an effect of folic acid.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 11, Related Pharmacology, Anticonvulsants

763. **1** Carbamazepine (Tegretol) is administered to control pain by reducing transmission of nerve impulses in clients with trigeminal neuralgia.

**2** Liver function is monitored to detect adverse reactions to carbamazepine, not to determine therapeutic effectiveness. **3** Carbamazepine is not given to influence cardiac output. **4** Carbamazepine is not administered to clients with trigeminal neuralgia (tic douloureux) for its anticonvulsant properties because seizures are not present with this disorder.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 11, Related Pharmacology, Anticonvulsants

764. **Answer:** 5 mL. Use the “Desire over Have” formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{2.5 \text{ g}}{5 \text{ g}} = \frac{x \text{ mL}}{10 \text{ mL}}$$

$$5x = 25$$

$$x = 25 \div 5$$

$$x = 5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Responsibilities Related to Medication Administration

765. **Answer: 6000 mg.** Two tablets every 4 hours over 24 hours equals a total of 12 tablets daily. Since each tablet has 500 mg, then  $500 \times 12 = 6000 \text{ mg}$ . This is more than the recommended maximum dose of 4000 mg/24 hr for short-term use.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Responsibilities Related to Medication Administration

766. **Answer: 1.5 mL.** First convert the 500 mg to its equivalent in grams. Use “Desire over Have” formula of ratio and proportion:

$$\frac{\text{Desire } 500 \text{ mg}}{\text{Have } 1000 \text{ mg}} = \frac{x \text{ g}}{1 \text{ g}}$$

$$1000x = 500$$

$$x = 500 \div 1000$$

$$x = 0.5 \text{ g}$$

Therefore, 500 mg is equivalent to 0.5 g. Now use “Desire over Have” formula of ratio and proportion to solve the problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{0.5 \text{ g}}{1 \text{ g}} = \frac{x \text{ mL}}{3 \text{ mL}}$$

$$x = 0.5 \times 3$$

$$x = 1.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Nursing Responsibilities Related to Medication Administration

767. 3 Mafenide (Sulfamylon) interferes with the kidneys' role in hydrogen ion excretion, resulting in metabolic acidosis.

1, 2, 4 This is not an adverse effect of this drug.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 10, Related Pharmacology, Antiinfectives

768. 2 Quinine administered orally can cause gastric irritation, resulting in nausea and vomiting. Administration of medication immediately after meals minimizes its irritating effect.

1 Absorption of the drug is not significantly affected by administration after meals. 3 The appetite is not affected by this drug as long as gastric irritation is avoided. 4 Quinidine, not quinine, is given for its antidysrhythmic effect.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes, **Reference:** Ch 13, Malaria, Nursing Care

769. 2 Potassium iodide, which aids in decreasing vascularity of the thyroid gland, decreases the risk for hemorrhage.

1 Thyroid hormone antagonists help decrease the body's metabolism. 3 Potassium iodide does not regulate parathyroid function. 4 Thyroid hormone antagonists help decrease the amount of thyroid hormones being secreted.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 9, Hyperthyroidism, Data Base

770. 4 Antacids interfere with absorption of drugs such as anticholinergics, barbiturates, some antibiotics, and cardiac drugs.

1 They may be taken as frequently as every 1 to 2 hours without adverse effects. 2 Antacids should be given 1 or 2 hours after meals and at bedtime. 3 Liquid antacids have a faster onset of action than tablets.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 8, Related Pharmacology, Antacids

771. **3** Any product containing aluminum, magnesium, or calcium ions should not be taken in the hour before or after an oral dose, because it decreases absorption by as much as 25% to 50%.

**1** Food interferes with absorption; it should be given 1 hour before or 2 hours after meals. **2** Citrus juice has no influence on this drug. **4** Antacids will interfere with absorption.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Infection, Related Pharmacology, Antibiotics

772. Answer: 1, 2, 3, 4.

**1** Central nervous system effects include depression that may lead to suicide attempts. **2** Gastrointestinal side effects include constipation, diarrhea, vomiting, and abdominal pain. **3** This interferon immune modifier causes flulike symptoms such as fever, muscle aches, and lethargy. **4** This drug's cardiovascular side effects include tachycardia, palpitations, and hypertension. **5** An integumentary response to this drug is sweating, not lack of perspiration (anhidrosis).

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 11, Multiple Sclerosis, Nursing Care

773. **1** Hydrocortisone (Cortef) is a glucocorticoid that has antiinflammatory action and aids in metabolism of carbohydrates, fats, and proteins, causing elevation of the blood glucose level. Thus, it enables the body to adapt to stress.

**2** It may promote fluid retention that results in hypertension and edema. **3** Shortness of breath (dyspnea) is caused by hypovolemia and decreased oxygen supply; neither is affected by hydrocortisone. **4** It may cause potassium depletion.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension;  
**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 9, Addison Disease, Data Base

774. **2** Desmopressin (DDAVP) replaces ADH, facilitating reabsorption of water and consequent return of a balanced fluid intake and urinary output.

**1** The mechanisms that regulate pH are not affected. **3** DDAVP does not alter serum glucose levels; diabetes mellitus, not diabetes insipidus, results in hyperglycemia. **4** Although correction of tachycardia is consistent with correction of dehydration, the client is not dehydrated if the fluid intake is adequate; respirations are unaffected.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Diabetes Insipidus, Nursing Care

775. **3** Naloxone is an opioid (narcotic) antagonist and will reverse respiratory depression caused by opioids.

**1, 2, 4** This is not needed; naloxone will correct the respiratory depression.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Related Pharmacology, Opioid Antagonist

776. **1** To prevent crystal formation, the client should have sufficient intake to produce 1000 to 1500 mL of urine daily while taking this drug.

**2** Straining urine is not indicated when the client is taking a urinary antiinfective. **3** Urinary decrease is of concern because it may indicate renal failure. If fluids are encouraged, the client's output should increase. **4** The drug need not be taken at a strict time daily.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 12, Related Pharmacology, Kidney-Specific Antiinfectives

777. Answer: 3, 4.

**1** Nausea is a common side effect; it can be diminished by administering the drug with food or using an enteric-coated product. **2** This is not a symptom of salicylate toxicity; it is related to the disease process and should be minimized by the administration of aspirin. **3** Blood in the stool indicates gastrointestinal irritation; it also may have resulted from aspirin's anticoagulant effect. **4** Salicylates, such as aspirin, can cause ototoxicity (affects eighth cranial nerve), which may manifest as ringing in the ears (tinnitus) or muffled hearing; it should be reported. **5** Increased urine output (polyuria) is not an indication of salicylate toxicity.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Pain, Related Pharmacology, Nonsteroidal Antiinflammatory Drugs

778. Answer: 2, 3, 5.

**1** This is unnecessary because calcium levels are not affected. **2** Changing positions slowly helps reduce orthostatic hypotension. **3** Peripheral edema may occur as a result of heart failure and must be reported. **4** Hair loss does not occur. **5** Grapefruit juice affects the metabolism of calcium channel blockers and should be avoided.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

779. **3** Although most chemotherapy causes diarrhea, vinCRISTine can cause severe constipation, impaction, or paralytic ileus.

**1, 2, 4** This side effect is shared with most other chemotherapeutic agents.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, General Nursing Care of Clients with Neoplastic Disorders

780. **3** Prolonged chemotherapy may slow production of leukocytes in bone marrow, thus suppressing the immune system. Antibiotics may be required to help counter infections that the body can no longer handle easily.

**1** The liver does not produce leukocytes. **2, 4** Although leukocytes are in both blood and lymph nodes, these cells are more mature than those found in the bone marrow and

thus more resistant to the effects of chemotherapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 3, Neoplastic Disorders, Related Pharmacology, Major Side Effects

781. **3** Many chemotherapeutic agents function by interfering with DNA replication associated with cellular reproduction (mitosis). Rapid mitosis of the stratified squamous epithelium of the mouth and anus results in these areas being powerfully affected by the drugs.

**1** This effect is not caused by direct irritation; most agents are administered parenterally. **2** A decreased appetite (anorexia) does not cause stomatitis. **4** Chemotherapeutic agents affect most rapidly proliferating cells, which include not only the cells of the GI epithelium but also those of the bone marrow and hair follicles.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Neoplastic Disorders, Related Pharmacology, Basic Concepts

782. **2** Methotrexate (Trexall) is a folic acid antagonist that can depress the bone marrow. This serious toxic effect is sometimes prevented by administration of folic acid. Some health care providers advocate its administration after a course of methotrexate therapy to avoid interfering with methotrexate activity.

**1, 3** Folic acid is a metabolite and does not destroy cancer cells. **4** Leucovorin calcium does not increase the production of phagocytes.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Neoplastic Disorders, Related Pharmacology, Miscellaneous Agents

783. **4** Hormone therapy must be withdrawn slowly to allow the adrenal glands to adjust and resume production of their hormone.

**1, 2, 3** This is not the reason for the gradual withdrawal of dexamethasone (Decadron).

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Integrated Processes:** Teaching/Learning; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

784. **1** Prolonged use of steroids may cause leukopenia as a result of bone marrow depression.

**2, 3** This elevates in acute inflammatory diseases; steroids help decrease it. **4** Serum glucose levels increase with steroid use.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

785. **2** Infected body fluids are tested to determine the antibiotics to which the organism is particularly sensitive or resistant (sensitivity).

**1** This is a test for antibody content. **3** This test provides data about fluid and electrolyte

balance. **4** The erythrocyte sedimentation rate (ESR) is nonspecific test for the presence of inflammation.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 3, Infection, General Nursing Care of Clients at Risk for Infection

786. **4** Streptomycin sulfate is ototoxic and may cause damage to auditory and vestibular portions of the eighth cranial nerve.

**1, 2, 3** This is not affected by streptomycin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 7, Related Pharmacology, Antituberculars

787. **3** Nonsystemic antacids are not readily absorbed, so they do not alter acid-base balance. Sodium bicarbonate is absorbed and can alter acid-base balance.

**1** These preparations do contain sodium. **2** Nonsystemic antacids are insoluble and not readily absorbed. **4** These are side effects of nonsystemic antacids.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Pharmacology, Antacids

788. **4** It decreases gastric secretion by inhibiting histamine at H<sub>2</sub> receptors.

**1, 2, 3** This is not the action of famotidine (Pepcid).

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 8, Related Pharmacology, Antisecretory Agents

789. **3** Over time clients receiving morphine develop tolerance and require increasing doses to relieve pain, thus requiring continuing reassessments.

**1** This will not meet client's need for relief from pain. **2** The client is terminal and the risk for addiction is of no concern. **4** The respiratory, not heart, rate is the significant vital sign to be monitored; morphine depresses the CNS, specifically the respiratory center in the brain.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 3, Pain, General Nursing Care of Clients in Pain

790. Answer: 3, 4, 5.

**1** Pyridoxine (vitamin B<sub>6</sub>) (NesTrex) should be taken to prevent neuritis, which is associated with INH. **2** The prophylactic drug therapy will be continued for 6 to 12 months. **3** The children are at an increased risk because the client's spouse has TB; the children should be screened as members of the household. **4** The positive skin test indicates that the client has been exposed to the bacilli and developed antibodies, not necessarily the disease itself; further diagnostic studies are indicated. **5** Both wine and aged cheese contain tyramine and histamine, which when taken concurrently with INH can cause headache, flushing, and a drop in blood pressure; these should be avoided when taking INH.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 7, Related Pharmacology, Antituberculars

791. **2** Rifampin (Rifadin) increases metabolism of oral contraceptives, which may result in an unplanned pregnancy.

**1, 3, 4** Rifampin (Rifadin) does not interact with this medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 7, Related Pharmacology, Antituberculars

792. **3** These drugs are incompatible in the same IV and therefore must be administered separately. By instituting a second line for the antibiotic, heparin can continue to infuse.

**1** Twice a day both drugs must run concurrently. Also, flushing the line may not eliminate remnants of the heparin, which is incompatible with vancomycin (Vancocin). **2** This is unsafe because heparin and vancomycin are incompatible and should not be administered via the same intravenous line. **4** The client has two medications prescribed, and it is a nurse's responsibility, not the health care provider's, to administer them safely.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Infection, Related Pharmacology, Antibiotics

793. Answer: 3, 5.

**1** Diarrhea, not constipation, may occur with valsartan (Diovan). **2** Hyperkalemia, not hypokalemia, may occur with valsartan. **3** Dysrhythmias, including second-degree heart block, are cardiovascular side effects of valsartan. It also may precipitate angina pectoris, myocardial infarction, and brain attack (CVA). **4** Valsartan does not cause altered visual acuity. **5** Angiotensin II receptor antagonists, such as valsartan, block vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle, thus reducing the blood pressure; dizziness, orthostatic hypotension, and excessive hypotension may occur.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Antihypertensives

794. Answer: 1, 3.

**1** Dry mouth occurs because of its anticholinergic properties. **2** A thin, watery discharge from nose (rhinorrhea) does not occur with this medication because of its anticholinergic properties. **3** Constipation is a side effect of this nonnitrate antidysrhythmic because of its anticholinergic properties. **4** Hypoglycemia, not hyperglycemia, may occur. **5** Urinary hesitancy and retention, rather than stress incontinence, occur.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

795. **2** Beta blockers (BBs) should not be taken at night because the blood pressure usually decreases when sleeping. This medication blocks beta-adrenergic receptors in the

heart, which ultimately lowers the blood pressure. Therefore, the drug should be taken early in the morning to maximize its therapeutic effect.

**1** Orthostatic hypotension is a side effect of BBs, and the client should change positions slowly to prevent dizziness and falls. **3** Drowsiness is a side effect of BBs, and the client should be taught precautions to prevent injury. **4** The pulse rate should be taken before administration because ventricular dysrhythmias and heart block may occur with BBs.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 6, Related Pharmacology, Antidysrhythmics

**796. 4** Allopurinol (Zyloprim) can potentiate the effect of oral hypoglycemics, causing hypoglycemia; the blood glucose level should be monitored more frequently.

**1** NSAIDs can be taken concurrently with Allopurinol. **2** A daily fluid intake of 2500 to 3000 mL will limit the risk of developing renal calculi. **3** Allopurinol should be taken with milk or food to decrease GI irritation.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 9, Related Pharmacology, Antidiabetic Agents

**797. 1** Bright yellow urine is an expected, insignificant side effect of vitamin B complex.

**2** There is no need to increase oral fluids; the client may consume the usual daily intake of fluid. **3** This may precipitate nausea when taken on an empty stomach; therefore, it should be taken with food. **4** Vitamin B complex is a water-soluble vitamin, and excess amounts are excreted in urine.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 8, Review of Nutrients, Vitamins

**798. 2** Rapid administration of furosemide (Lasix) can cause tinnitus, loss of hearing, and ear pain.

**1** Lasix has a diuretic effect; urinary retention does not occur. **3** Lasix does not affect the heart rate. **4** Lasix does not cause peripheral neuropathy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Related Pharmacology, Diuretics

**799. 1** Human B-type natriuretic peptide binds to receptors in vascular smooth muscle and endothelial cells, leading to smooth muscle relaxation. Dyspnea will decrease as a result of the action of nesiritide (Natrekor).

**2** Hypotension will not decrease. Hypotension is a side effect of nesiritide. **3** Nesiritide is not used for unstable angina. **4** Nesiritide is not an antidysrhythmic.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 6, Heart Failure, Data Base

**800. 1** Ototoxicity is an adverse effect of aminoglycosides such as streptomycin.

**2, 3, 4** Ototoxicity is not an adverse effect of this drug.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** [Ch 7](#), Related Pharmacology, Antituberculars

## UNIT 3

# Mental Health/Psychiatric Nursing

# CHAPTER 15

# Foundations of Mental Health/Psychiatric Nursing

---

# Development of Personality

## Overview

- A Sum of all traits that differentiate one individual from another
- B Total behavior pattern of an individual through which inner interests are expressed
- C Unique and distinctive way of perceiving, behaving, and interacting with the environment and other people
- D Constellation of defense mechanisms for coping with inner and outer pressures
- E Functional role within a family system
- F Emergence of personality occurs at about 2 years of age

## Factors Involved in Personality Development

- A Behavior is a learned response that develops as a result of past experiences and genetic, environmental, and psychologic factors
- B To protect the individual's emotional well-being, these experiences are organized in the psyche on three different levels
  1. Conscious: composed of past experiences, easily recalled
  2. Subconscious: composed of material that has been pushed out of the conscious but can be recalled with some effort
  3. Unconscious: contains the largest body of material; greatly influences behavior
    - a. This material cannot be intentionally brought back into awareness because usually it is unacceptable and painful to the individual
    - b. If recalled, usually it is disguised or distorted, as in dreams or slips of the tongue; however, it is still capable of producing high levels of anxiety
    - c. According to Freud, the personality consists of three parts: the id, ego, and superego
      - (1) Id is the inborn unconscious instincts, impulses, and urges; it is totally self-centered
      - (2) Ego is the conscious self, the "I" that deals with reality; the part of the personality that is revealed to the environment; ego strengths enable an individual to cope with frustration and delay gratification; it begins to develop during infancy
      - (3) Superego is the part of the personality that, mainly on an unconscious level, controls, inhibits, and regulates impulses and instincts whose uncontrolled expression would endanger the emotional well-being of the individual and the stability of society; incorporates parental, religious, and societal values; it develops between the ages of 3 to 6 years

## Formation of the Personality

- A Develops in overlapping stages that shade and merge together
- 1. Particular conflicts and tasks must be mastered during each stage of development

from infancy to maturity if needs are to be met and mental health maintained/enhanced

2. Successful resolution of the conflicts and acquisition of the tasks associated with each stage is essential to development
3. If these tasks are not acquired at specific periods, the basic structure of the personality is weakened
4. Factors in each stage persist as a permanent part of the personality
5. Childhood identifications are integrated with basic drives, native endowments, and opportunities offered in social roles
6. Unresolved conflicts remain in the unconscious and may, at times, result in maladaptive behavior
7. Personality is capable of change throughout life; as one ages, there may be a decreased ability to cope

#### B Psychodynamic theory (Freud)

1. Psychodynamic theories propose that human behavior is largely governed by motives and drives that are internal and often unconscious
2. Freud believed that development proceeds best when children's psychosexual needs at each stage are met, but not exceeded; the stages are
  - a. Oral (birth to 1 year)—psychosexual needs gratified orally; unable to delay gratification; begins to develop self-concept from the responses of others
  - b. Anal (1 to 3 years)—bladder and bowel training occurs; this interferes with instinctual impulses; struggle of giving of self and breaking the symbiotic ties to mother; as the ties are broken, the child learns independence; struggle with toilet training creates conflict between child's needs and parents' desires
  - c. Phallic (3 to 5 years)—psychosexual energy directed to genitals (oedipal); values and rules learned from parents; guilt and self-esteem develop; incestuous desire for opposite sex parent develops and creates fear and guilt feelings; desires are repressed, and introjection and role identification with parent of the same sex occurs
  - d. Latency (6 to 12 years)—mastery of learning; relationships with same-sex peers develop; sexual instincts are relatively quiet
  - e. Genital (12 years and beyond)—period of sexual maturity in which psychosexual needs are directed toward sexual relationships; sexual activity increases; sexual identity is strengthened or attacked

#### C Psychosocial theory (Erikson)

1. Psychosocial theory attributes development to social interactions and relationships that occur throughout the life span; failure to master a developmental stage may leave a person more susceptible to mental illness
2. Erikson believed that development results from social aims or conflicts arising from feelings, parent-child interactions, and social relationships
3. Eight major crises or conflicts need to be faced during a lifetime; each stage is marked by a struggle between two opposing tendencies, both of which are experienced by the individual; stages are

- a. Trust versus mistrust (birth to 1 year)—infant develops a sense of whether the world can be trusted; learns to depend on satisfaction that is derived from attention to needs; and trust develops when needs are met; psychosocial strength—hope; failure to consistently meet the needs of the infant can lead to difficult interpersonal relationships
- b. Autonomy versus shame and doubt (1 to 3 years)—child develops first sense of self as independent or as shameful and doubtful; the struggle of holding on to or letting go; an internal struggle for self-identity; love versus hate; psychosocial strength—will; if not provided the opportunity for some independence in activity, the child will lack self-confidence
- c. Initiative versus guilt (3 to 6 years)—child learns ability to try new things and learns how to handle failure; period of intensive activity, play, and consuming fantasies, where child interjects parents' social consciousness; psychosocial strength—purpose; if outlets for creativity and exploration are not provided, child blames self for lack of initiative
- d. Industry versus inferiority (6 to 12 years)—child learns how to make things with others and strives to achieve success; psychosocial strength—self-worth; if not provided with mastery experiences and realistic positive feedback about performance, low self-esteem will occur
- e. Identity versus confusion (puberty to young adulthood)—adolescent determines own sense of self; psychosocial strength—fidelity; if overly restricted in the exploration of interests and independent growth, discouragement and confusion about the direction to take in life will occur
- f. Intimacy versus isolation (young adulthood)—person makes commitment to another; moves from the relative security of self-identity to the relative insecurity involved in establishing intimacy with another; psychosocial strength—love; if there has been a lack of intimacy in the family of origin and previous developmental stages are not achieved successfully, the development of intimacy is unlikely to occur and the individual may become isolated and self-absorbed
- g. Generativity versus stagnation (middle adulthood)—person seeks to guide the next generation or risks feelings of personal incompleteness; psychosocial strength—care; if previous developmental stages were unsuccessfully completed and there is a continued lack of self-confidence or preoccupation with self, the adult fails to engage in meaningful activities that help support others
- h. Integrity versus despair (late life)—older adult seeks a sense of personal accomplishment, adapts to triumphs and disappointments with a certain ego integrity and accepts death, or falls into despair; psychosocial strength—wisdom; if this stage is not achieved, there is a feeling of being unfulfilled and sad

#### D Interpersonal theory (Sullivan)

1. Development results from interpersonal relationships with others in maximizing satisfaction of needs while minimizing insecurity
2. Development results from interpersonal relationships in the infancy, childhood, juvenile, preadolescent, adolescent, and late adolescent stages

- a. Infancy (0 to 2 years): learns to differentiate self from others; learns through trial and error; learns from parental interactions to rely on others to gratify needs and satisfy wishes; develops a sense of basic trust, security, and self-worth; ends with language development; if needs are not met anxiety and emotional withdrawal occur
- b. Childhood (2 to 6 years): language development allows for education; development of body image and self-perception; self-esteem develops with sublimation; child learns to communicate needs through the use of words and to accept delayed gratification and interference with wish fulfillment; expresses impulses in socially acceptable ways or develops a feeling of living among enemies
- c. Juvenile (6 to 10 years): relations with peers allow child to see self objectively; develops conscience; behavior is connected to others' opinions; organizes and uses experiences in terms of approval and disapproval received; begins using selective inattention and disassociates those experiences that cause physical or emotional discomfort and pain; difficulty with this stage results in ineffective social interaction and social isolation
- d. Preadolescent (10 to 13 years): develops same-sex friends; moves from egocentrism to love; able to form satisfying relationships and work with peers; uses competition, compromise, and cooperation; difficulty with this stage results in a lack of reciprocity in interpersonal relationships
- e. Adolescent (13 to 17 years): interest in sexual activity; learns how to establish satisfactory relationships with members of the opposite sex; if attractions are severely discouraged or thwarted, insecurity and loneliness develop
- f. Late adolescent (17 to 19 years): personality integration; able to integrate the needs of society without becoming overwhelmed with anxiety; inability to achieve personality integration results in regression and egocentrism for life

#### E Cognitive development theory (Piaget)

1. Sensorimotor stage (infancy-toddler): infant develops physically with a gradual increase in the ability to think and use language; progresses from simple reflex responses through repetitive behaviors to deliberate and imaginative activity
2. Preoperational thought stage (preschool): child learns to imitate and play; begins to use symbols and language although interpretation is literal
3. Preoperational thought stage continues (school age): child begins to understand relationships and develops basic conceptual thought and intuitive reasoning
4. Concrete operational thought stage (preadolescent): thinking is more socialized and logical with increased intellectual and conceptual development; begins problem solving by use of inductive reasoning and logical thought
5. Formal operational stage (adolescent): develops true abstract thought by application of logical tests; achieves conceptual independence and problem-solving ability

# Physiology, Cognition, Emotions, and Behavior

## Overview

- A Feelings, thoughts, physiology, and behaviors are interactive, and each influences the others
- B Life is a continually changing process, and when these changes occur in areas of significance, they often produce distinct emotional responses including
1. Resistance to change: the individual hesitates to accept or adapt to the change and may attempt to deny its occurrence or reject its outcome
  2. Regression: the individual returns to an earlier type of behavior that, at the time, provided some satisfaction and gratification and now provides an escape from the unacceptable or anxiety-producing situation
  3. Acceptance and progression: the individual adapts to the change and expends energy on outside objects rather than self-centered aims
- C Many therapists use a variety of therapeutic approaches based on client need

## Neurophysiologic Theoretical Basis of Behavior

- A There is general acceptance that there is no real division between mind and body, mental and physical, brain and thought
- B Research into the neurophysiologic basis for behavior focuses on anatomy and physiology of the brain and nervous system and their relationship to health and illness
1. Structural differences such as ventricle size or cerebral atrophy are identified by neuroimaging methods such as magnetic resonance imaging (MRI) and computed tomography (CT) scans
  2. Physiologic differences, such as hyperactivity in certain areas of the brain, are identified by electroencephalogram (EEG) studies and positron emission tomography (PET) scans
- C An understanding of the anatomy and physiology of the central nervous system is essential
1. The brain weighs about 3 lb and is composed of trillions of cells, 100 billion neurons, and the cells that support their function
  2. Neurons do not touch each other but communicate across synapses that separate them via chemical messengers called neurotransmitters
  3. Neurons are receptive to some neurotransmitters and not to others
  4. Major excitatory and inhibitory neurotransmitters include dopamine, norepinephrine, serotonin, acetylcholine, and gamma-aminobutyric acid (GABA)
  5. The level of neurotransmitters that excite or inhibit neural activity is influenced by their production, metabolism/inactivation, and reuptake/storage
  6. Abnormalities in the level of various neurotransmitters have been linked to many psychiatric illnesses (e.g., excess of dopamine to schizophrenia; decreased serotonin levels to depression); most psychotropic medications work by altering levels of

neurotransmitters

- D Considerable knowledge gaps still exist as to the specific pathophysiology of psychiatric disorders, but research continues, especially in the area of neurotransmitters
- E Research is examining the importance of other factors such as genetics, infections, sleep deprivation, toxins, nutrition, hormonal shifts, trauma, and stress as influences on neurobiology and behavior
- F Only a few mental health disorders have identified genetic markers, including Huntington disease and a rare form of Alzheimer disease

## Psychobiologic Health

- A Category of psychophysiologic disruptions in which organic impairment is evident
- B Anxiety stimulates the autonomic nervous system and nervous and endocrine impulses appear to center on one particular organ, creating physical illness and changes in tissue structure
- C Selye's stress theory helps identify mental-physical interactions
- D Predisposing factors arise from biologic, psychologic, and sociocultural perspectives; precipitating stressors include any experience the individual interprets as stressful
- E Stress is often unrecognized consciously; if recognized, individuals are unable to relate this to the physical symptoms of the psychophysiologic disorder
- F Efforts to match specific stressors to specific diseases have not been successful
- G These disorders have both physical stressors (e.g., dietary changes, substance abuse, physical exertion, allergic immune responses, infectious agents, trauma) and psychologic stressors (e.g., anxiety, fear, tension), which combine to produce pathophysiologic signs and symptoms
- H Common psychobiologic diseases/disorders include migraine headaches, primary hypertension, angina, neck and back pain, asthma, irritable bowel syndrome, neurodermatitis, impotence, and frigidity
- I In many autoimmune disorders (e.g., systemic lupus erythematosus, ulcerative colitis, myasthenia gravis, multiple sclerosis) there is often an exacerbation of symptoms or relapse during periods of psychologic stress; stress may diminish the immune response
- J Therapy is directed toward both physical and emotional problems

## Cognitive Theory

- A Cognitive theorists believe that
  1. Patterns of thinking, mindsets, and belief systems influence feelings and behavior
  2. Dysfunctional cognitive patterns and cognitive distortions (e.g., pessimism, overgeneralizing, unrealistic expectations) lead to alterations in mood and behavior
- B Cognitive therapy is most effective in treating clients with anxiety and mood disorders
- C Interventions focus on identification of dysfunctional thought patterns and replacement with healthier, more reality-based thinking
- D Examples of cognitive therapy include

1. Thought journals: client records situations in which cognitive distortions occur, and the thoughts and feelings that follow
2. Cognitive restructuring (cognitive reframing) through positive self-talk and rational mindset: when a cognitive distortion/negative thought occurs the client replaces it with more positive rational thoughts
3. Cognitive rehearsal: client prepares mental script to address situations that usually trigger cognitive distortions

## Behavioral Theory

A Behavioral theorists believe that

1. All behavior is motivated and learned
